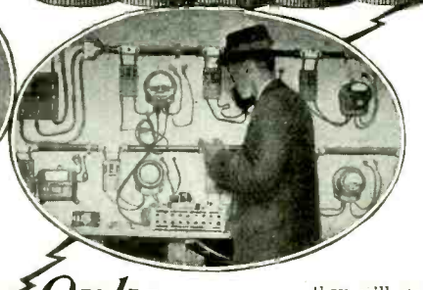
NOT ONE CENT IN ADVANCE

In twenty years' practice Terrell Croft has learned many things about electricity. As apprentice, as lineman, as draftsman, and finally as electrical engineer with the Westinghouse Company, he has learned the practical man's wants.

With his own practical experience, and with the co-operation of a score of other authorities, he has completed what is considered the most valuable study and reference course ever attempted.



No other set of books or course of instruction ever adhered so closely to actual work. Nothing else of the kind ever told so vividly the story of electricity as experts know it.

CROFT'S LIBRARY of PRACTICAL ELECTRICITY

8 Vols.-Flexibly bound-3000 Pages 2100 Illustrations

A SET of books which covers the wide subject of electricity completely, comprehensively and practically cannot be adequately described, therefore we extend to every reader of this paper an invitation to examine the books absolutely free.

Merely fill out the coupon below and return to us. We will ship the books, all charges prepaid, for ten days' free use. The books are pocket-size. Carry one or two with you to work, and look them over evenings. Test their usefulness by using them in connection with your work. Keep them ten full days. Then return them at our expense if you think they will not enable you to know electricity as experts know it.

Pay only $2 per month for eight months if you are thoroughly pleased.

This is your opportunity. Will you grasp it?

Only $2 per month for 8 months for a complete electrical education

McGraw-Hill Book Co., Inc.,
239 W. 39th Street,
New York, N. Y.
Gentlemen: The CROFT LIBRARY OF ELECTRICITY reached me March 3 and more than came up to my expectations. I have been in the electrical business for fifteen years, and know the general run of electrical books. Terrell Croft's Library is the best I have ever had the pleasure of examining.
Yours truly,
EDWARD T. HOFF.

EDITORIAL

Piped Cold

ONE of the most profound annual summer mysteries of the twentieth century—at least to the writer—is our hot office or our hot home. We would not think of an unheated house or office in the dead of winter with the temperature near the zero point, but curiously enough we allow ourselves to suffer cruelly from the heat in the summer time when the temperature rages up in the nineties. Is it not a most curious world in which we live?

We think nothing of spending fabulous sums in the winter for our coal supply in order to keep warm and comfortable. But in the summer we prefer to spend nothing and suffer untold misery in consequence. Babies and grown up sick folk die like flies by the thousands on account of the heat, while we stand by helpless, or rather as if we were devoid of all intelligence, while the totally unnecessary slaughter goes on incessantly. How our grandchildren will read with astonishment that for decades human beings had their houses piped for heat, but had not enough sense to run a freezing solution or other freezing agent thru the self-same pipes in the torrid summer days!

There might be an excuse for our criminal negligence if we had not the means at hand to keep us cool and comfortable in summer. But we really have all the means, all the apparatus; in fact, everything—including our radiators and pipes. But we prefer not only to let our babies and our feeble old folk die unnecessarily every summer, but we actually lose untold millions of dollars thru non-production when the "dog-days" are upon us. No one can work at his best when the mercury climbs to dizzy heights. Production, whether mental or physical, slows down anywhere between forty and eighty per cent. Statistics prove it. Factories as well as offices slow down and just barely creep along. Think of this enormous, incalculable loss alone, not to mention all the physical suffering due to the heat.

Ah, yes, we *do* have our brave fans—which, however, do not cool at all, but only remind us how hot our bodies are the minute we are not in the immediate vicinity of one of these spinning monuments to our stupidity.

For our dear fans only stir up the hot air *and* the dust. Our skin, wet or moist from perspiration, meets this stirred up air and due to a well known physical phenomenon, *surface evaporation*, we experience a *sense of coolness*, but the air itself is *not* cooled. It is true that surface evaporation produces cold, but in order to have it, it is necessary to let the fans blow upon us, or nearly so, and everyone knows this is far from healthy, frequently producing severe colds. Besides, as soon as we leave the fan our suffering from the heat is all the more acute.

Where is the practical genius who will "study up" on refrigeration and sell us a cheap refrigerating machine which we can connect to our already existing steam or hot water radiators? For the same money which we now spend on fans we ought to be able to buy the machine. And for the money it costs to run the fans we can run the refrigerator, too.

Hundreds of refrigerators have been invented, but the simplest and best no doubt for our purpose is the *cold-air process*. It is based on the principle that the compression of air generates heat and in its subsequent expansion absorbs heat. The air is first comprest, is then past thru a cooler under pressure, after which it is expanded in a cylinder. No chemicals are used with this system and it possesses the very distinct advantage that extremely low temperatures are readily obtainable.

H. GERNSBACK.

The **ELECTRICAL EXPERIMENTER** is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. **A green wrapper indicates expiration. No copies sent after expiration.**

All communications and contributions to this journal should be address to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

MR. CHARLES F. HAANEL, St. Louis, Mo.

In Re "The Master Key."

My Dear Mr. Haanel: The value of an idea is determined by its application. Pragmatism has long since spread beyond the confines of Missouri. The world to-day insists on being shown.

The lash of circumstances and the logic of events are, more than ever, impelling men to think. Whether an idea be a new process for picking cabbages, or an old process (Kaiserism, for instance) for preserving kings, we are from Missouri.

A philosophy of life having as its base blind optimism; a religion that won't work seven days a week, or a proposition that isn't practical, appeals to the intelligent not at all. It is results that we want and the acid test is: will it work?

The Master Key qualifies. It is the most lucidly scientific statement of "Truth" that I have seen. It reconciles rationalism and religion; illumines economic determinism and the materialistic conception of history, and is an infallible guide to understanding. It contains in condensed form the substance of an entire library on science. Its teaching, if consistently applied, will make a man healthy, wealthy and wise. Its distribution is supermissionary work in excelsis. Those who wish to think intelligently will find it invaluable.

Intelligence rules. Desire, intelligently directed, is a creative force which automatically causes its object to manifest on a material plane. It is the law. Let him that hath an ear to hear, hear.

Yours truly,

CHAS. A. HEARD.

May 15, 1918.

DEAR MR. HAANEL: Ever since I have been old enough to read, I have been reading metaphysical literature. I have waded ears deep through the books from all ages, all lands, all schools.

I have rejected tons of lies, oceans of misconceptions, an entire universe of false deductions.

I have found grains of truth in mines of folly, and worlds of truth in a single grain. The pursuit was interesting in itself, and I do not regret the time spent upon it. But it was a genuine surprise to read your Master Key System and find within, the essence of all that I had read, with much more added thereto.

In this extraordinary system you have sifted the true from the false; you have given in concrete form all that is worth while in many schools of philosophy.

You have placed arcane truths into the hands of the uninitiated as weapons they can learn to use without danger to themselves. I congratulate you. You are doing mankind a service.

Yours very sincerely,

CHARLES F. OURSLER.

501 Fifth Avenue, New York City, N. Y.

Detroit, Mich., May 28, 1917.

DEAR SIR: The words, "Your world will change as if by magic, the moment you realize the marvelous power within your control," page 6, I have underlined. They state a fact, a real live fact; and to me this is the most wonderful, the most important fact of all—that one may put this knowledge to an immediate test, that one may, after learning of this power, proceed to apply it with a definite knowledge as to results.

W. M. HOWE.

THE LOWE OBSERVATORY
Edgar Lucien Larkin, Director
Los Angeles, Cal., Dec. 6, 1916.

MR. CHAS. F. HAANEL, St. Louis, Mo.

DEAR SIR: Your booklet, Master Key, ought to be expanded into a book. Its teachings that Mind is the all-dominating creative force is precisely in line with the wonders of the most recent psychology. All persons having desks should have this pamphlet thereon. And it would be a fitting pocket companion.

EDGAR LUCIEN LARKIN.

which can unlock the secret chambers of success and throw wide the doors which seem to bar men and women from the Treasure House of Nature.

FREE

There is no charge for "The MASTER KEY," It is FREE!

Some men and women seem to attract success, power, wealth, health and attainment with very little conscious effort; others conquer with great difficulty, still others fail altogether to reach their ambitions, desires and ideals. Why is this so? Why should some realize their ambitions easily, others with difficulty, and still others not at all?

"The Master Key" will tell you why and open your eyes to the great possibilities before you. No one can read it and not be a changed man or woman. None but who will emerge from its magic pages with a firmer grasp of the future—a surer understanding of what he or she can do and has been all along able to do, but didn't know they could. You are perhaps one of these—and this key is certainly for you. It will help you—tell you how to make a real success of your life, how to lift yourself up, to be more, to do more and to have more.

"The Master Key" is a key with which many are converting loss into gain, fear into courage, despair into joy, hope into fruition; a key with which many are finding health, self-reliance, power; a key which thrills, fascinates, carries conviction, understanding, perception, inspiration, the key which is changing the lives of many and may have an almost unbelievable influence upon your life.

VIOLET-RAYS

The Magic-like Reliever of Pain. The Marvel of the Age for Rheumatism, Neuralgia, Neuritis, Arteriosclerosis, Hemorrhoids, and Practically Every Other Ailment to Which Flesh is Heir. A Wonderful Beautifier Too! Amazing in the Treatment of Eczema, Blackheads, Wrinkles, Falling Hair, Dandruff, and Every Other Faulty Condition of the Skin and Scalp!

10 DAYS FREE IN YOUR OWN HOME

See for yourself the miraculous results of Violet-Rays. Get the wonderful Violetta Violet-Ray Machine for 10 days' free use in your own home. Give yourself exactly the same Violet-Ray treatments for which eminent physicians and beauty specialists charge big fees. Note the marvelous relief that comes even with the first treatment. See how you can virtually feel the Violet-Rays reaching to the very root and cause of any ailment with the great curative forces of Heat, Light, Electric Energy, and Ozone. See too how Violet-Rays youthifies the skin, purifies the scalp and stimulates hair-growth. Note above all how refreshing the effect of Violet-Rays to mind and body—how invigorating and vitalizing—how much better you work, eat and sleep. Prove all these benefits to yourself without obligation. Try the Violetta for 10 days free, and if you are not more than amazed and delighted, simply send it back.

BLEADON-DUN CO., Dept. 2F,
326 W. Madison St., Chicago, Ill.

Please send me your free book and 10 days' free trial offer on the Violet-Ray Machine. Also full information as to treatment for ailments marked below.

Asthma	Earache	Piles
Barbers' Itch	Eczema	Paralysis
Boils	Eye Diseases	Pimples
Blackheads	Headache	Pyorrhea
Bunions	Hay Fever	Rheumatism
Callous	Goitre	Skin Diseases

Was $100

SAVE $43

Now $57

By Being Your Own Salesman

Try the Oliver for Five Days at Our Expense

This Simple Plan Makes It Easy to Own an Oliver

This sales plan is a legacy of the war, which taught us all new economies —ones we won't forget.

By reorganizing our method of distribution, we were able to make a radical reduction in price.

We did not change the famous Oliver an iota. The machine we now sell for $57 is the identical one formerly priced at $100—our latest and best model.

During the war we learned that it was unnecessary to have great numbers of travelling salesmen and numerous, expensive branch houses throughout the country. We were also able to discontinue many other superfluous, costly sales methods. You benefit by these savings.

Pre-war extravagances were ended. And our plan of selling made simpler. We send the Oliver to you for free trial, so that you may judge it, in solitude, without being influenced.

Only $3.00 Per Month

Do not buy or rent any typewriter until you know the Oliver. A five days' trial will help you decide. Besides saving you $43, we make the payments easy. We ask no advance payment. But merely $3 per month until the $57 is paid.

Do not confuse this offer with those for second-hand or rebuilt typewriters. Our $57 Oliver is our brand new identical Model 9, formerly priced at $100. It has not been changed in the slightest.

No Money Down

Merely send us the coupon. We ship an Oliver to you. Try it for five days. Then, if you agree that it is the finest typewriter at any price, merely send us $3 per month, until the $57 is paid.

If you do not believe that this is the greatest typewriter opportunity, return the Oliver to us, express collect. We even refund the outgoing transportation charges. You have not placed yourself under any obligation to buy.

When the Oliver comes to you, you will admire its many advancements —all the refinements made possible during 24 years of typewriter-making. A finer typewriter is impossible.

The coupon below gives you the opportunity to be your own salesman and save yourself $43.

Note that it brings EITHER an Oliver for Free Trial, or further information. Check it accordingly.

Over 700,000 Sold

Olivers are in use all over the world. Some of the large concerns in the United States using Olivers are: U. S. Steel Corporation, Baldwin Locomotive Works, Nat'l City Bank of N. Y., Diamond Match Company, Pennsylvania Railroad, Hart, Schaffner & Marx, American Bridge Company, Encyclopedia Britannica, Otis Elevator Company, Bethlehem Steel Company, Boston Elevated Railways, N. Y. Edison Company, and a host of others of equal importance.

And thousands of Olivers are used by individuals—every business is represented among our users. And every profession.

You can depend on this wide use of the Oliver as a guarantee of its worth.

No Finer Built

Examine the Oliver carefully. It is built in a model factory with a heritage of ideals. Only the finest materials are used. And this accounts for the prolonged life of the Oliver, its durability, its inbuilt service. It is simplified in construction and built to withstand the hardest usage. The Oliver in war service proved its fine design and construction.

You can't buy a better typewriter at any price.

Mail the coupon now for either a Free Trial Oliver or further information.

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

"ELECTRO"

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains real chemicals and apparata to perform real chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing **a Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature.** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

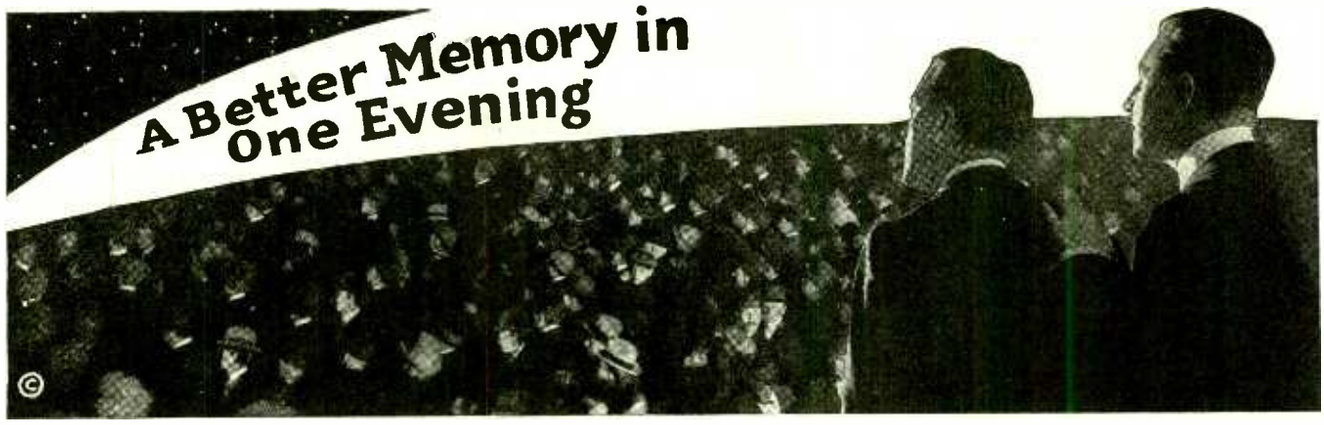
A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and dowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00



Shipping Weight 10 lbs.

(Can be shipped by Express only.) Send your order today to:

Can You Be Given A Better Memory In One Evening?

It has been done for over a quarter of million men and women in all walks of life—what they say about their amazing experiences

A BETTER memory in one evening It sounds impossible. Yet this is exactly what Mr. Roth, the world-famous memory expert, has done for over a quarter of a million men and women—given them a better memory in a single evening!

You've doubtless seen Mr. Roth give his startling memory demonstrations in public. At any rate, you've heard of him.

No one denies that Mr. Roth himself has a remarkable memory—that has been proved beyond question. But many people say that while Mr. Roth's marvelous memory is beyond dispute, it was "born in him," and that it is doubtful if the average man or woman can ever develop a memory that approaches Mr. Roth's. And, least of all, in one evening! A fair question, that. So let us see how it works out in actual practice.

From time to time testimonials have been published from enthusiastic users stating the wonderful memory powers they have developed by following Mr. Roth's method. Evidence from people who have actually done it is conclusive. And, in addition to this, the publishers of Mr. Roth's Memory Course have offered to send it on five days' free trial. No money was asked for. The entire course was sent wholly on approval. The recipient was free to test Mr. Roth's method for five days. Then if he found that it had not brought about a remarkable improvement in his memory, he could return the Course and he wouldn't be out a penny. An offer such as this could not have been made unless the Course would do all that was claimed for it.

Over a quarter of a million Roth Memory Courses have been sent out to the general public—and paid for—on this basis. What happened? This—the publishers were flooded with letters endorsing the Roth Memory Course in the highest possible terms. By far the great majority of people paid for the Course in less than five days. So delighted were they with the remarkable improvement it had made in their memory, that they were eager to own it at once.

If you could drop into the offices of the publishers you would be shown a huge pile of enthusiastic testimonial letters which would take you days to read. They all tell the same story—amazement at the wonderful nature of the Course—enthusiasm over the marked improvement it has made in weak memories—appreciation of the opportunity to possess it—and surprise at the low cost!

These thousands upon thousands of letters of appreciation came from Members of Congress, ministers, doctors, lawyers, professors, teachers, students, managers, clerks, stenographers, bookkeepers, salesmen, factory executives—men and women in all walks of life.

Here are extracts from a few of the many thousands of letters received from users of the Roth Memory Course:

"You claim to give 'a better memory in one evening.' You ought to change it to 'one hour,' for I improved my memory 100 per cent in one hour."

Many a man who is called upon to speak in public fails to get his message "across" because a weak memory forces him to read from notes. A prominent public man says:

"I have made a wonderful improvement in my ability to speak in public. Formerly I had to read from notes. Now I can speak extemporaneously and get a smash and drive in my talk which amazes me as much as it impresses my audience."

Lots of people who can think keen thoughts fail miserably when it comes to talking them. They blame their lack of confidence and a limited vocabulary. In most cases the real cause is a weak memory. An enthusiast writes:

"No longer do I stammer, and sputter my words. Now I am looked upon as a brilliant conversationalist, and the Roth Memory Course did it."

Many a business man is handicapped because he cannot instantly recall prices, selling talks, and other data about his business. A salesman says:

"I had been trying to memorize a selling talk for several weeks, but failed completely. By applying Mr. Roth's principles I memorized it in thirty minutes."

The main handicap of the young man in business is lack of experience. Experience is largely a matter of never forgetting facts and experiences which apply to the matter under consideration. A young man says:

"I have just been promoted to an important position which I never dreamed of getting for at least five years. The Roth Memory Course got me the promotion by enabling me to instantly recall all the vital facts and figures about our business which I have ever learned."

Educators by the score write in to say that the Roth Memory Course should be taught in every school and college, and that it would not only make better students, but would considerably shorten the period of instruction.

The father of a little girl of 13 says: "As a result of using Mr. Roth's principles my little girl's papers are rated the highest in the class."

Students by the dozen say that the Roth Memory Course enables them to master in a few hours studies that formerly required weeks of grinding effort.

One of the greatest surprises about the Roth Memory Course is that there is really nothing to study and no hard work to do. It is largely a question of following a few simple principles. In one hour you can improve your memory—in an evening you can easily double its power—and inside of a week you can have a memory that will surprise you as well as your friends.

"I am amazed at the simplicity of this wonderful work"—"studying it is a continuous pleasure"—"The system works like magic"—"I am thrilled by the power the Course gives me"—"It is as simple as child's play and as efficient as a filing cabinet"—expressions like these have been written in by the score.

And the price!—

"The first lesson alone is worth 100 times $5," says one enthusiast. Hundreds of people have stated that they would gladly have paid many times the price of five dollars. "I am sending you the money by return mail,"—and "I've never let go of a 'five' with so much pleasure," says another.

You have always wanted a "good memory." Now you can have it. There is no laborious study to undertake. Mr. Roth shows you that a good memory depends mainly on applying a few simple principles which you can learn in less than thirty minutes. You can master the whole Course in a few hours of delightful reading.

Here is what you will find after you apply Mr. Roth's simple principles: Names and faces will flash instantly to your mind. Facts and figures which you now forget, or laboriously write down, will be on the tip of your tongue the instant you want them. Your conversational powers will improve wonderfully. The right word, the right expression, the right thought will almost speak itself the instant you want it. Never again will you be humiliated by saying, "I forgot!" Once put a thing into your mind and it will be there as permanently as though etched in steel, and as easily recalled as taking a card out of a card-index. Your mental powers will become sharper and quicker. At all times you will have that keenness of mind most men experience only occasionally. Your self-confidence will increase. You will thrill with a new sense of power. You will——

But there's no need to go further. For you can see for yourself, at no cost, exactly what the Roth Memory Course will do for you. Merely fill in and mail the coupon. Send no money. The complete Course will be sent to you immediately, all charges prepaid. Examine it thoroughly. Test it in every way you can think of. Apply its simple principles. Note the almost magical change it brings about in your memory.

Then, after you have done this, if you feel that you can possibly afford to be without the Roth Memory Course, send it back and you will owe nothing But if you feel, as over a quarter of a million others have felt, that you simply cannot afford to be without the Roth Memory Course, then send only five dollars in full payment.

In one week from today you can have a memory that will thrill you with power and amaze your friends. You can do this if you mail the coupon NOW.

What they say:

"Every business man should avail himself of this wonderful system of Memory Training."
G. L. Helms, Indianapolis, Ind.

"I have studied only the first lesson, but it has proved invaluable."
R. H. Gifford, Chicago.

"Worth thousands of dollars to anyone in business."
J. M. Thompson, Columbus, O.

"It has been of such great value to me as a lawyer that I cannot find words to express my appreciation."
George J. Lemmon, Denver, Col.

"So simple and fascinating that it is play to study it."
E. W. Buckingham, M.D., Norfolk, Va.

"I am amazed at my increased memory powers since studying the first lesson."
Anne S. Leach, Wytheville, Va.

"I am thankful to have your Course. It is worth many times five dollars."
Rev. J. A. Northrup, Streator, Ill.

"The system works like magic."
Ralph D. Stoddard, Cleveland, O.

"I was surprised to see how I improved my memory the first evening."
M. J. Blackenshop, Mohawk, W. Va.

"I find that I can do my work much easier after studying the first two lessons."
A. R. Johnson, Palestine, Texas.

"It has done wonders for me."
Arthur Lippincott, Erie, Pa.

"Wonderful!—I would not sell it for any amount of money."
Ella Busse, State College, Pa.

WHAT THE RADIO AMATEUR NEWS IS:

It is destined to become the greatest Radio magazine in the world. Indeed its first issue, the July number, with a circulation of 15,000 copies and its 48 pages and cover in two colors, its 125 wonderful illustrations, already make it the *greatest and biggest Radio Magazine in print today.*

RADIO AMATEUR NEWS is the only INDEPENDENT monthly wireless magazine in existence. It caters to no commercial interests—it has no boss save its readers. It is "different"—it has the latest radio news. It is a scientific magazine but it caters largely to the RADIO AMATEUR—it is by and for the Amateur. It is publisht by the publishers of the ELECTRICAL EXPERIMENTER, but there will be no duplication of articles in the two magazines. Both will be entirely different—but both together will give you ALL the radio news of all the world. Whether you are a Professor or an Amateur, get a sample copy or order it from your News-dealer today.

FOR SALE AT ALL NEWS-STANDS.

$100.00 RADIO CONTEST is announced in the July issue of RADIO AMATEUR NEWS.

"An Ideal Receiving Outfit" is the subject of the contest. $100.00 in cash prizes for the best manuscripts submitted.

JUDGES OF THE CONTEST ARE:

Dr. Lee de Forest, Inventor of the Audion
Dr. Greenleaf W. Pickard, Inventor of the Crystal Detector
Dr. Louis Cohen, Ph.D., Radio expert and inventor
Samuel D. Cohen, Amateur Radio expert
H. W. Secor, Assoc. I.R.E., Associate Editor, Electrical Experimenter
H. Gernsback, Editor, Electrical Experimenter & Radio Amateur News
Fritz Lowenstein, Radio expert

"I was astounded at my new power over men and women. People actually went out of their way to do things for me—they seemed EAGER TO PLEASE ME"

The Secret of Making People Like You

"Getting people to like you is the quick road to success—it's more important than ability," says this man. It surely did wonders for him. How he does it—a simple method which anyone can use instantly

ALL the office was talking about it and we were wondering which one of us would be the lucky man.

There was an important job to be filled—as Assistant-to-the-President. According to the general run of salaries in the office, this one would easily pay from $7,000 to $10,000 a year.

The main requisite, as we understood it, was striking personality and the ability to meet even the biggest men in their offices, their clubs and their homes on a basis of absolute equality. This the firm considered of even more importance than knowledge of the business.

YOU know just what happens when news of this sort gets around an office. The boys got to picking the man among themselves. They had the choice all narrowed down to two men—Harrison and myself. That was the way I felt about it, too. Harrison was big enough for the job, and could undoubtedly make a success of it. But, personally, I felt that I had the edge on him in lots of ways. And I was sure that the firm knew it too.

Never shall I forget my thrill of pleasure when the president's secretary came into my office with a cheery smile, looked at me meaningly, handed me a bulletin, and said, "Mr. Frazer, here is the news about the new Assistant-to-the-President." There seemed to be a new note of added respect in her attitude toward me. I smiled my appreciation as she left my desk.

At last I had come into my own! Never did the sun shine so brightly as on that morning, and never did it seem so good to be alive! These were my thoughts as I gazed out of the window, seeing not the hurrying throngs, but vivid pictures of my new position flashing before me. And then for a further joyous thrill I read the bulletin. It said, "Effective January 1, Mr. Henry J. Peters, of our Cleveland office, will assume the duties of Assistant-to-the-President at the home office."

PETERS! Peters!—surely it *couldn't* be Peters! Why, this fellow Peters was only a branch-office salesman. . . . *Personality!* Why, he was only five feet four inches high, and had no more personality than a mouse. Stack him up against a big man and he'd look and act like an office boy. I knew Peters well and there was nothing to him, nothing at all.

January the first came and Peters assumed his new duties. All the boys were openly hostile to him. Naturally, I felt very keenly about it, and didn't exactly go out of my way to make things pleasant for him—not exactly!

But our open opposition didn't seem to bother Peters. He went right on with his work and began to make good. Soon I noticed that, despite my feeling against him, I was secretly beginning to admire him. He was winning over the other boys, too. It wasn't long before we all buried our little hatchets and pulled up with Peters.

The funny thing about it was the big hit he made with the people we did business with. I never saw anything like it. They would come in and write in and telephone in to the firm and praise Peters to the skies. They insisted on doing business with him, and gave him orders of a size that made us dizzy to look at. And offers of positions!—why, Peters had almost as many fancy-figure positions offered to him as a dictionary has words.

WHAT I could not get into my mind was how a little, unassuming, ordinary-to-look-at chap like Peters could make such an impression with every one—especially with influential men. He seemed to have an uncanny influence over people. The masterly Peters of today was an altogether different man from the commonplace Peters I had first met years ago. I could not figure it out, nor could the other boys.

One day at luncheon I came right out and asked Peters how he did it. I half expected him to evade. But he didn't. He let me in on the secret. He said he was not afraid to do it because there was always plenty of room at the top.

What Peters told me acted on my mind in exactly the same way as when you stand on a hill and look through binocular glasses at objects in the far distance. Many things I could not see before suddenly leaped into my mind with startling clearness. A new sense of power surged through me. And I felt the urge to put it into action.

Within a month I was getting remarkable results. *I had suddenly become popular.* Business men of importance who had formerly given me only a passing nod of acquaintance suddenly showed a desire for my friendship. I was invited into the most select social circles. People—even strangers—actually went out of their way to do things for me. At first I was astounded at my new power over men and women. Not only could I get them to do what I wanted them to do, but they actually anticipated my wishes and seemed eager to *please me.*

One of our biggest customers had a grievance against the firm. He held off payment of a big bill and switched to one of our competitors. I was sent to see him. He met me like a cornered tiger. A few words and I calmed him. Inside of fifteen minutes he was showering me with apologies. He gave me a check in full payment, another big order, and promised to continue giving us all his business.

I could tell you dozens of similar instances, but they all tell the same story—the ability to make people like you, believe what you want them to believe, and to do what you want them to do. I take no personal credit for what I have done. All the credit I give to the method Peters told me about. We have told it to lots of our friends, and it has enabled them to do just as remarkable things as Peters and I have done.

BUT YOU want to know what method I used to do all these remarkable things. It is this: You know that everyone doesn't think alike. What one likes another dislikes. What pleases one offends another. And what offends one pleases another. Well, there is your cue. You can make an instant hit with anyone if you say the things they want you to say, and act the way they want you to act. Do this and they will surely like you, and believe in you, and will go out of their way to PLEASE YOU.

You can do this easily by knowing certain simple signs. Written on every man, woman and child are signs, as clearly and as distinctly as though they were in letters a foot high, which show you from one quick glance exactly what to say and to do to please them—to get them to believe what you want them to believe—to think as you think—to do exactly what you want them to do.

Knowing these simple signs is the whole secret of getting what you want out of life—of making friends, of business and social advancement. Every great leader uses this method. That is why he is a leader. Use it yourself and you will quickly become a leader—nothing can stop you. And you will want to use it if for no other reason than to protect yourself against others.

WHAT Peters told me at luncheon that day was this: "Get Dr. Blackford's 'Reading Character at Sight.'" I did so. This is how I learned to do all the remarkable things I have told you about.

You have heard of Dr. Blackford, the Master Character analyst. Many concerns will not employ a man without first getting Dr. Blackford to pass on him. Concerns such as Westinghouse Electric and Manufacturing Company, Baker Vawter Company, Scott Paper Company and many others pay Dr. Blackford large annual fees for advice on dealing with human nature.

So great was the demand for these services that Dr. Blackford could not even begin to fill all her engagements. So Dr. Blackford has explained the method in a simple seven-lesson course entitled "Reading Character at Sight." Even a half-hour's reading of this remarkable course will give you an insight into human nature and a power over people which will surprise you.

Such confidence have the publishers in Dr. Blackford's Course, "Reading Character at Sight," that they will gladly send it to you on approval. Send no money. Merely fill in and mail the coupon. The complete course will go to you instantly, on approval, all charges prepaid. Look it over thoroughly. See if it lives up to the claims made for it. If you do not want to keep it, then return it, and the transaction is closed. And if you decide to keep it—as you surely will—then merely remit Five Dollars in full payment.

Remember, you take no risk, you assume no obligation. The entire course goes to you on approval. You've everything to gain—nothing to lose. So mail the coupon NOW, while this remarkable offer remains open.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

Talking from 'Plane to Earth

How it is Done Explained in Non-Technical Terms

"HELLO! hello, Treasury!" cried the aviator. "I am now 2,600 feet over you in plane 38,070 from Bolling Field." The aviation officer then read President Wilson's "Victory Liberty Loan" message by wireless, thru the air, and concluded by bidding good-bye to the crowd. Lieutenant H. E. Metcalf, the radio officer aboard the 'plane, talked from an airplane flying 2,600 feet overhead to 15,000 persons assembled at the southern steps of the Treasury, at Washington, D. C., by the use of the wireless telephone and a newly invented *sound amplifier*, which possesses great power.

The throng of Government employes, dismissed for the capital's opening demonstration for the loan, cheered the President's message as spoken thru the air and enun-

(*Continued on page* 281)

Copyright, 1919, by E. P. Co.

Thanks to the Remarkable Developing of the "Loudspeaking" Wireless Telephone in His Absence, President Wilson Will Be Able to Talk to His Constituents on This Side of the Atlantic from Midocean on His Way Home. It is estimated that the President's Voice May Be Heard by 50,000 Persons Grouped About a Reproducer Here, While He Is Yet 1,000 Miles at Sea. The New Wireless Telephone Device Is the Invention of Three San Francisco Men—E. S. Pridham (Shown in the Picture), P. L. Jensen and O. B. Moorehead. It Consists of an Anti-Noise Transmitter, Called a "Magnavox," and an Amplifier. It was Used by Admiral Sims and Billie Burke When They Addrest 15,000 People on the Steps of the United States Treasury Building, Washington, D. C. Mr. Pridham, on "Victory Loan Day," April 21, Personally Supervised the Demonstration of the Wonderful New Anti-Noise Telephone That Made Telephone History. An Aviator 2,600 Feet (One-Half Mile) Overhead Spoke, With This Instrument, to 15,000 People Thru a "Magnavox" Amplifier.

Talking Thru the Trees

By MAJOR-GENERAL GEORGE O. SQUIER

Chief Signal Officer, U. S. Army

AS long ago as 1904, the author conducted some experiments with a view to utilizing growing trees as *antennae* for radio-telegraphy and discovered the efficacy, in a general way, of using a direct metallic contact to certain trees (principally *eucalyptus*) to increase the audibility of radio signals. My attention was first called to this phenomenon during the course of summer maneuvers of the Army at Camp Atascadero, Calif., where, due to the prevalence of the dry season and the unusual character of the soil, it was found that the regular Army buzzer telephone and telegraph sets were inoperative with any ordinary ground or earth but became operative when connected to a metallic nail driven in the trunk or roots of a *live tree*. This incident led the author to pursue the subject experimentally in the autumn of 1904 continuing the experiments to the range of frequencies then employed in radio-telegraphy.

Tree Antennae.

In connection with the organization and development of *Transatlantic radio reception*, which was carried out during the period of the war to provide against the possibility of the interruption of the submarine cable system, the Signal Corps established a chain of special receiving stations in different parts of the United States to copy and record enemy and Allied radio messages from European stations for the information of our Army General Staff.

In the prosecution of this work, directions were given to the Signal Corps Laboratory at Camp Alfred Vail, Little Silver, N. J., and also to the experimental staff in Washington to test the efficiency of *growing trees* as receiving antennae, in connection with this service, using the vastly superior technique and facilities now represented in the radio Art as compared with the crude apparatus with which the discovery was made in 1904. With a collection of apparatus representing the most advanced state of the radio Art, the problem, as a war measure, was attacked anew and has now reached a point where a very brief outline of some of the physical results obtained should be presented in the interests of the development of the Art in general. Since the phenomena involved embrace a variety of physical problems rather than strictly engineering ones, these data are presented in the hope that our scientists may see in the experiments some points of departure for further research.

How Trans-Atlantic Radio Messages Are Copied Via Tree Antenna

European Radio Signals, Via the Trees.

It was immediately discovered that with the sensitive amplifiers now in use it was possible to *receive signals from the principal European stations* by simply laying a small wire netting on the ground beneath the tree and connecting an insulated wire *to a nail driven in the tree well within the outline of the tree top*. See Fig. 1. Messages having been received from England, France, Germany and Italy.

This encouraging first result justified a more careful examination of the phenomena and the most suitable arrangement of circuits for the purpose.

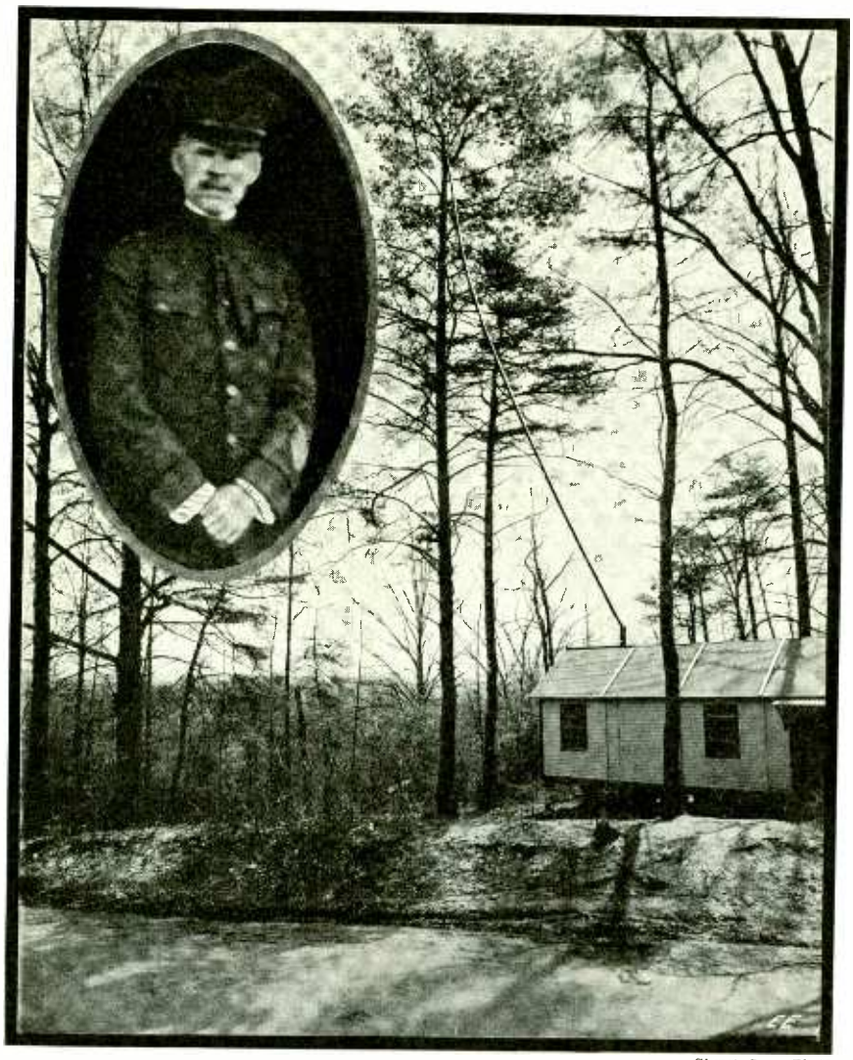
And Now the "Floraphone."

The messages carried over this tree telephone and telegram system have been named by the writer. They are to be "floragrams." The tree telephone is to be a "floraphone"; the tree telegraph a "floragraph."

The discovery is now announced after experiments covering fifteen years, beginning in California and continuing intermittently until the outbreak of the war, when they went forward with vigor as an emergency means of communication. The system was utilized during the war in "listening in" on the German radio communication.

The final development took place in a small portable laboratory, purchased from a mail order house, capable of being carried to any place in the woods. A group of soldiers, sleeping in the house and taking turns at copying messages, assisted the writer in the development of the apparatus.

Without entering into the details of these preliminary experiments here it may be said that one of the best receiving arrangements is found to be an elevated tree earth-terminal in the upper part of the tree top, *and an earth consisting practically of several short pieces of INSULATED wire, SEALED AT THE OUTER END, radiating out from a common center, and buried a few inches beneath the surface of the ground in the neighborhood of the tree.* See Fig. 2.



It was soon found that a tree-antenna could be used efficiently as a *multiple radio receiving set over widely different wave lengths*, see Fig. 3A, receiving either from separate terminals at the same (shown dotted in Fig. 3A) or different heights of the tree, *or in series from the same terminal.* See Fig. 3B.

This same type of circuit was employed in an inverse manner for radio-telephonic transmitting purposes, altho the experiments thus far have been limited to short distances. It was found that *2-way radio telephonic communication* was easily established with remarkably low values of transmitting antenna current. See diagram of this test illustrated at Fig. 4.

The flexibility of this arrangement is very striking. The linking up of *wire* and *wireless* methods was found to be both convenient and efficient. *Radio-telephonic messages from airplanes* were readily received by the tree-antenna arrangement and *transferred thence to the wire system* of the city of Washington and finally received at any point desired. See Fig. 5.

Furthermore, *radio-telephonic transmission* thru the tree-antenna was *received by*

Dashing Thru the Night With Flames Spouting from Their Exhaust Pipes, and Propellers Whirling, Shoot These Captive Airplanes With Their Joy-Seeking Passengers. The Latest Idea in the Summer's Pleasure Grounds. The "Bronx Exposition Amusement Park," in New York City, Will Feature This Diversion. It Gives All the Thrills of a Real Ride in an Airplane.

A Dash to the Clouds

By GEORGE HOLMES

THE restless feeling that comes to everyone at the first sign of spring—the trees budding, birds returning from the South and gaily announcing the rise of the sun each morn—stirs the blood of every man, woman and child, the young or old, and makes them want to get out into the great outdoors. Those who are not able to go far away into the hills, mountains and seashore for extended periods to cure this "spring fever" must needs find some attraction nearer home. The average person dwelling in the city in the little cigar boxes we are wont to call apartments finds himself cramped for room. It is like the old story of the dog who was forced to wag his tail up and down, instead of sideways. He *had* to wag it up and down because the walls of the apartment were too close together and he could not wag it any other way.

Enterprising business men have found a solution for the everyday worker and his family, by bringing within easy reach amusement parks and seaside resorts, where he may either spend a week with his family or have his family there during the week and be able to go there himself in the evenings after he is thru with the business of the day, and also on Saturdays and Sundays. Principal among these resorts, one rather new and practically in its infancy, but rapidly growing, is the *Bronx Exposition Amusement Park,* within the boundary of New York City.

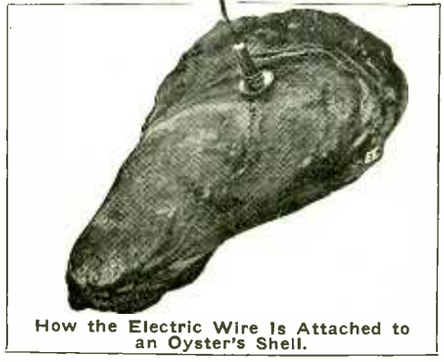
Just a short time ago, in visiting the grounds, you could hear the hammering and sawing of carpenters, the concrete mixers running, steel and structural workers on the job, and general signs of activity. To the layman this work has always proven of great interest, but so few have the opportunity of witnessing these gigantic buildings rise as if from nothing. Usually under cover in great secrecy, these surprises are manufactured. On the opening day, the great crowds of visitors come to gasp in astonishment at the amazing array of amusement devices, both old and new, devised and evolved during the long winter slumber between seasons.

This year we have what is perhaps the largest, greatest and most spectacular device ever before shown to the public. In the many years of fairs, expositions and amusement parks, gone by, we have never before witnest a most startling affair than that of the *"Captive Airplane"* complete in every detail, spouting flames from its exhausts, and the whirring of the propeller, mounting higher and higher into the heavens, and then shutting off its power, in a series of dips taking away one's breath, gradually coming back to the starting point. This device, which has never been tried out before, even in the model form, is being constructed from plans evolved as the work progresses, and has every possibility of becoming a success. There will be several machines which will consist of the regular airplane body, wings and necessary stays. In addition there will be a motor attached to the propeller. This motor and propeller will be more for attraction and sensation than actual driving power. The cars themselves will travel on a monorail track driven by electric power taken thru a contact shoe to the rail and back to the motors underneath the car. This machine will start from a height of about 5 feet above the ground and gradually rises over a steep incline several hundred feet over the tops of the amusement buildings, and, arrived at the top, the power will be shut off, when the car will begin its dizzy descent of the many loops of monorail track. Death defying, some people might say, but so scientifically and carefully is this device constructed that there is not the least bit of danger to any of the sixteen passengers in the car. Most glorious will be the spectacle at night when the many lights of the park and searchlights will play upon the snorting monster of the air as it carries its load of pleasure-seekers on its startling trip thru the clouds, for then it will present the true airplane appearance, as no track will be visible. It will give an effect far greater than can ever be shown in our illustration.

Approximately 175,000 feet of lumber will go into the making of this new airplane railway. The railway itself from start to finish will be 3,200 feet in length, each car carrying sixteen persons. The

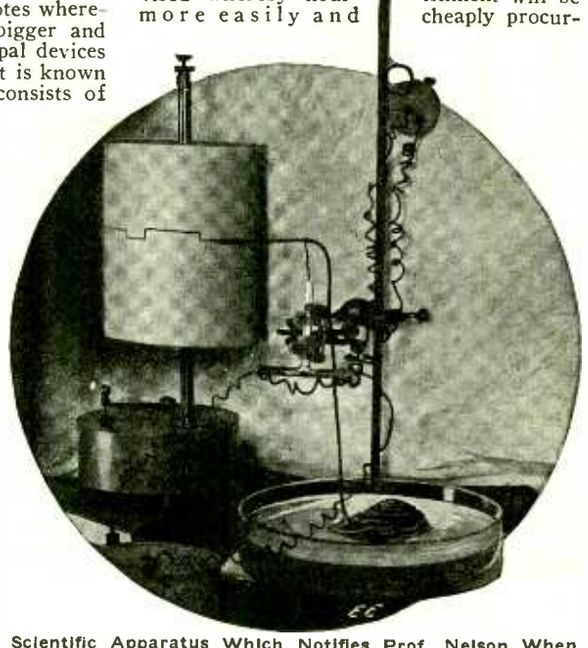
(*Continued on page* 244)

The Oyster's Autograph



How the Oyster tells us when he eats

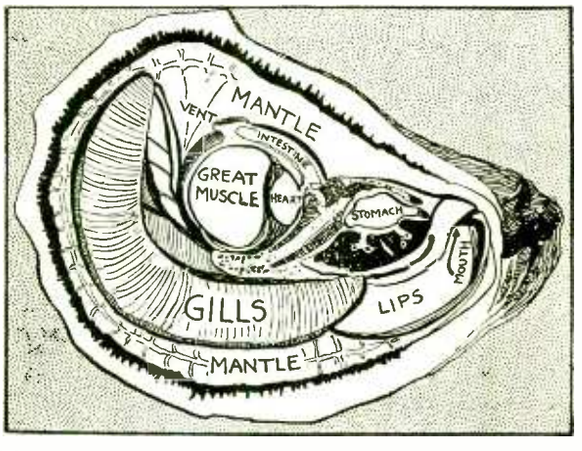
IF we could learn what food the oyster really needs, we could then raise better crops of this highly delicious and edible sea food. Not being possest of any supernatural powers, we must resort to some crude means, mechanical or electrical, for determining the environment factors and the foods which are best suited to the oyster. This field up to a short time ago had not been investigated to any appreciable extent. Heretofore, the growth of the oyster had been left mostly to fishermen, who, in raising these oysters in the oyster beds, had not been doing all that was best for them, causing illness and even deaths in many instances by poisoning in one form or another thru eating oysters which had possibly reposed in sewage or other polluted waters.



Professor Thurlow C. Nelson, Who Is Making a Scientific Study of the Oyster. He Is Here Seen Wiring an Oyster Preparatory to Feeding It. See Recording Apparatus at Right.

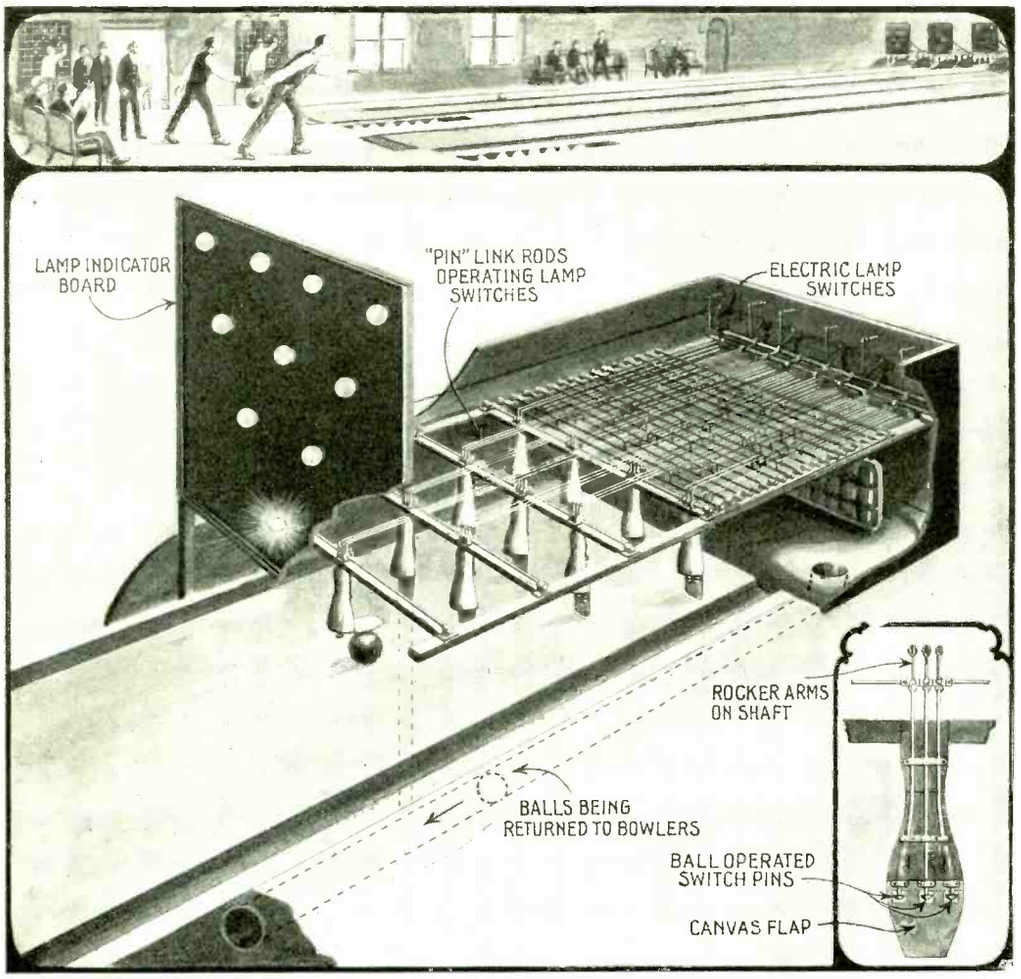
It remained for Professor Thurlow C. Nelson, Assistant Professor of Zoölogy at the State University of New Jersey, to open up a research laboratory in the midst of the oyster beds at Tuckerton, N. J., to perform a series of experiments and studies on the oyster to determine how best to raise a better crop each season. Professor Nelson has fitted out a houseboat in Little Egg Harbor, provided with a number of ingenious contrivances to aid him in gathering a fund of information as to the oyster's routine, particular stress being made on what he normally eats, and the effects that certain foods will have when fed to the bivalves. In this way a method may be determined from these notes whereby we can grow and breed a bigger and better oyster. One of the principal devices used in these experiments is what is known as a standard recorder, which consists of a drum with a cylinder mounted on it, and a cross-sectioned chart paper, on which the oyster records its various minute movements. To the oyster itself a wire is attached, which is connected to the indicator. When the oyster opens, the movement of the shell closes an electric circuit. The indicator or recorder then functions, and the observer can read on the drum the time that it takes to open, how long it remains open, and when the shell closes again!

How the Electric Wire Is Attached to an Oyster's Shell.



With the closing of this electric circuit, a bell rings notifying the attendant that the oyster is displaying some activity. By means of this apparatus it will be possible to determine the time, day or night, that the oyster feeds, the frequency of these periods and their duration and the kind of food that is consumed over any period. Just what kinds may be learned by removing the oyster from this apparatus and noting its weight after a period of treatment, the weight before going under the treatment being also carefully noted. A microscopic examination of the stomach is then made which shows the contents before assimilation. The rate of growth can also be studied in connection with the effects of artificial feeding. It is a generally accepted fact that it requires three seasons before an oyster reaches market maturity. It therefore becomes obvious that any reduction of this period will result in many advantages to the oyster grower, and also it will mean cheaper oysters to the consumer, with less chance of getting typhoid fever. The U. S. Government has conducted many experiments with oysters in different bodies of water. According to data issued in their bulletins, they have found that many of the tricks of the oysterman have robbed the oyster of much of its nutritive value. Another factor is the danger from disease infection in the waters which are saturated with filth from city sewers. Professor Nelson is now conducting experiments to collect a fund of definite knowledge of the oyster's dietary requisites. From these records a method will be devised whereby nourishment will be more easily and cheaply procurable. The natural flavor variety of oyster will again be restored, and the *drinking* process now used among dealers will be abandoned.

Scientific Apparatus Which Notifies Prof. Nelson When the Oyster Is Feeding and Records the Movement of Its Shell. Electricity Actuates the Instrument.



The *drinking* or *plumping* fraud as practised on consumers hoaxes the uninformed into the belief that the resulting bloated whiteness of the bivalves is a mark of par-excellence. As a matter of fact, the oyster so treated loses the greater part of its flavor, and due to conditions under which the trick is carried on, there is the likelihood of its being laden with germs, which may cause serious illness and in many cases death. Thousands of cases of typhoid fever and various other stomach and intestinal troubles result from the con-

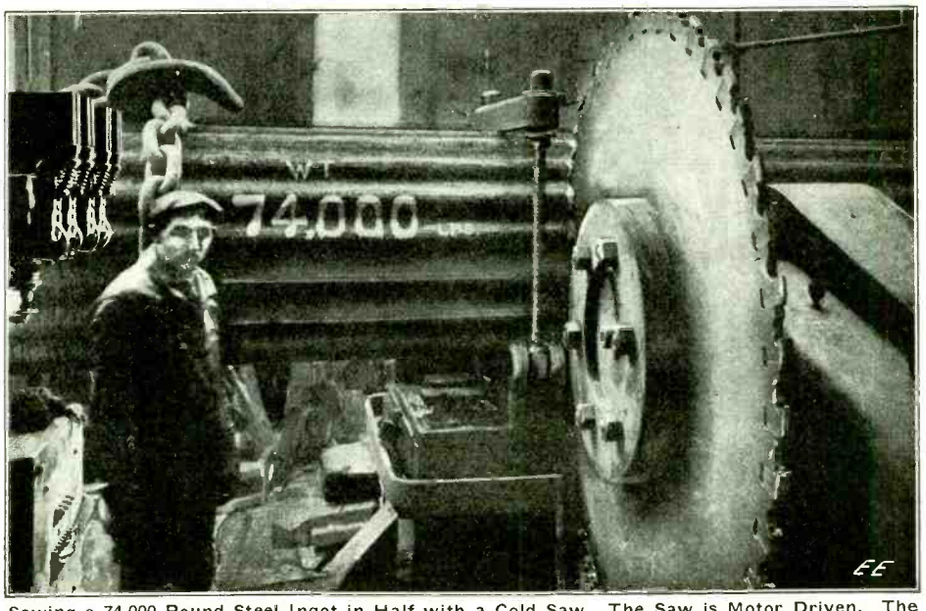
The Anatomy of the Oyster—Just Think, Fellow-Banqueters, of All the Wonderful Machinery of Nature We Devour in Every Oyster Cocktail.

Electrifying The Bowling Alley

At Last—Sportsmen—an Electrified Bowling Alley. No Score Keepers, no Pin Boys. Just "Shoot" the Ball Down the Alley. The "Play" is indicated on the Lamp Indicator Board as Here Shown. The Pins Are Self-Resetting.

HATS off to a Milwaukee electrician, Max A. Drews, who has at last come to the rescue of the sporting man, who wonders what science is anyway, with an up-to-date *electrified bowling alley*. Who bowls? The answer is—everybody, in America. So, as we are all interested in bowling, let us take a look at the wonderful invention which Mr. Drews has solved and perfected, which makes it possible at last to bowl all by your lonesome self in your bomb-proof bowling alley down in the basement of your country castle, without the bother of pin boys. In this twentieth century electrified bowling alley *de Luxe*, all the "hits" are chalked up on an electric lamp score-board, automatically—the pins all reset themselves—and the balls, after having wrought more or less terrible havoc among the pin brigade return, thru a gravity conduit, to the bowler's position at the front of the bowling alley.

The details have been worked out very carefully, indeed, by the inventor, so that any regular bowling play is correctly registered on the electric-lamp score-board.

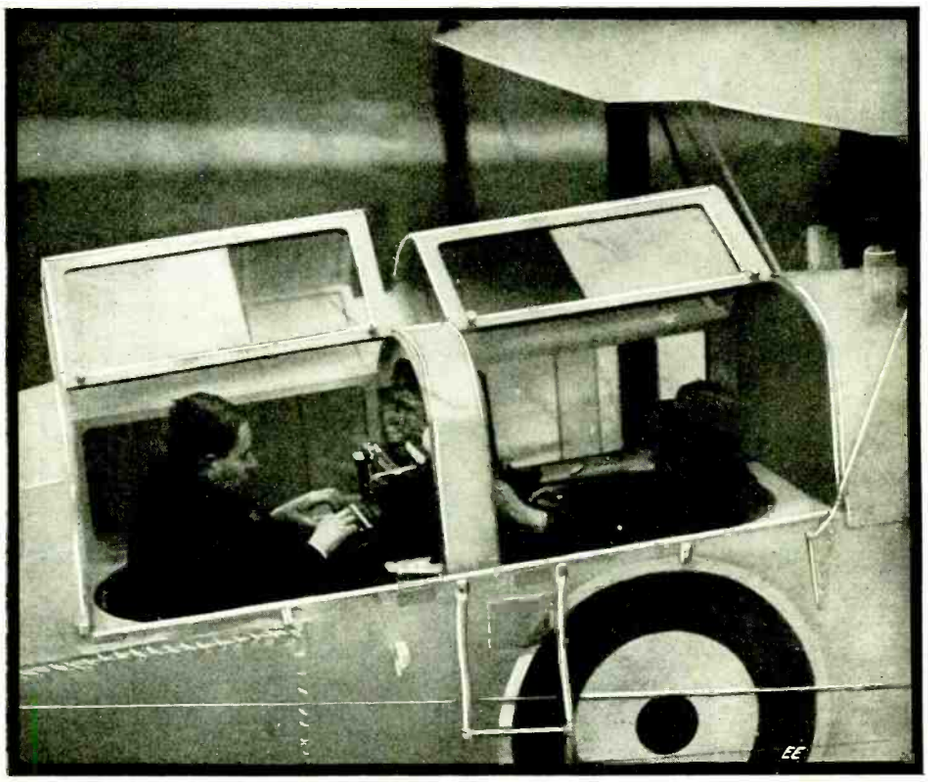


The pins are cleverly arranged and consist of a solid upper member and a canvas or other flexible flap for the lower member, as the detail illustration shows. Generally speaking, there are three electrical contacts and actuating fingers arranged on each pin, one in the center, and one at either side. In the general illustration a ball is shown just passing under the front pin of the set. It will be noted how it passes easily under the upper rigid portion of the pin and presses the flap backwards, without being checked in its onward travel. When the ball, however, passes under the stationary half of the pin, one of the three electrical contact pins is pushed upward, and in doing so it actuates a rocker arm fastened on the cross-wise plates supporting the pins, which in turn connects, thru a wire link, with one of a battery of switches at the rear of the alley, all in the manner apparent. The rear ball pocket of the alley is tapered so that all of the balls, after they have struck the padded cushion, move toward the conduit opening, thru which conduit they travel under the effect of gravity back to the bowling pit at the front of the alley. The lamp score-board is arranged in the formation of the pin set-up, as the illustration shows. It represents one of the cleverest devices ever brought out.

Sawing a 74,000-lb. Steel Ingot

THE accompanying illustration shows a remarkable inserted tooth saw, developed at Pittsburgh, Penna. In the photograph may be seen an 84-inch diameter inserted tooth saw blade, with plate 1 inch thick, and a width of kerf 1½ by 5/16 inches, having a weight of 2,000 lbs., cutting a 35-inch diameter ingot of 31 carbon steel, weighing 74,000 lbs.! Some of these saws are made as large as 90 inches in diameter.

It may be stated that these inserted tooth saw blades are extensively used for cutting ingots, bars, forgings, castings, rails and structural shapes and are made for arbor or sprocket drive machines.



It is claimed that this design permits the use of more teeth than any other inserted tooth blade, and light sections of material can be cut more rapidly than with solid blades, as the rigid construction will withstand a heavier feed. The body of these blades is made of hardened vanadium alloy tool steel, in the grooved slots of which are inserted the best of high-speed steel cutters, treated suitably for all classes of metal cutting. The teeth are secured by interchangeable tool steel wedges and are adjusted from the bottom by hex-head brass screws to obtain correct height when assembling. (*Continued on page* 250)

Sawing a 74,000 Pound Steel Ingot in Half with a Cold Saw. The Saw is Motor Driven. The Saw Teeth Never Touch the Steel—the Air Compresst in Front of the Teeth Does the Cutting.

Typewriting in an Airplane

The photograph herewith demonstrates how the warring countries of Europe are fast adapting themselves to peacetime pursuits, in sport, pleasure and business. This illustration shows what was formerly a powerful French bombing plane converted into a business man's traveling plane, and fitted with an up-to-date office, including a typewriter. Many business men of today do not lose even a moment's time, once they leave their home for the office, and have typewriters fitted in their automobile. One of the leading New York newspaper editors, Arthur Brisbane, has a typewriter fitted in his car, and makes the trip from his home night and morning with his ever-ready "mill" at his side, in the event that he may wish to dash off a new editorial inspiration before it has flown away—unregistered. The same idea of recording thoughts on the wing, as it were, holds as well for business men as for authors and editors. Not only this, but in the spacious airplane cock-pit here shown, the business man using such a modern conveyance to or from business can carry his secretary along.

The Photograph Herewith Shows How a Powerful French Bombing Plane of Large Size Was Converted, After the Signing of the Armistice, Into a Model Business Man's Plane. In the Spacious Cabin of the Plane There Is Ample Room for a Desk and a Typewriter, and the Business Man May Carry His Secretary With Him. The Cock-pit Here Shown Is for Passengers, and Is Separate From the Pilot's Compartment.

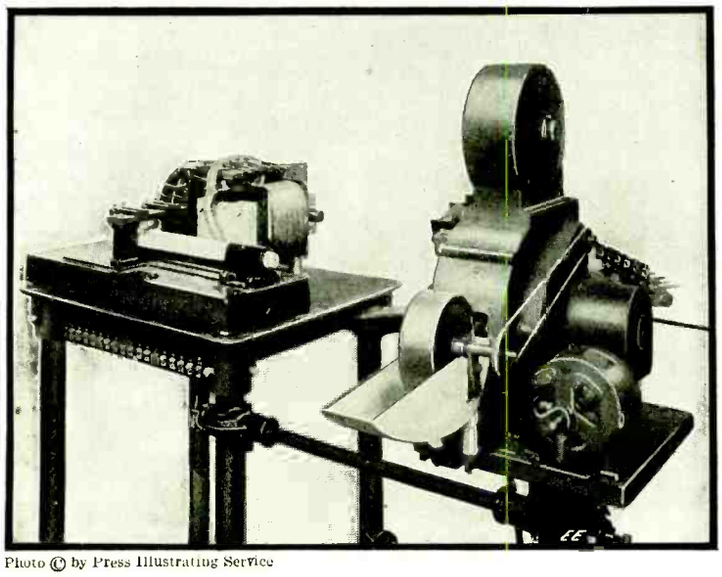
Recording Galvanometer and Tuning Fork Timer

An ingenious recording galvanometer and tuning fork timer, as used by the U. S. Signal Corps, is shown in the photograph herewith. The recording galvanometer employs a paper tape, especially prepared by a chemical process, on which the light image reflected from the galvanometer mirror is photographically recorded, and the tape is afterward past thru a chemical bath, which develops the image, similar to the usual photo printing method. Wherever accurate measurements have to be made by means of such a recording device, in which the fluctuations of an electric current are to be recorded in the form of an undulating or wavy line, running along the recording tape, it becomes necessary to accurately space off the tape, so that the time period of each current variation can be readily determined, such as cycles per second, the interruptions of a circuit per second, its frequency, etc.

To solve this problem, use is here made of a simple and yet extremely accurate timer in the form of a musical tuning fork. It is well known that when such a fork is struck by a wooden hammer, that it vibrates with a certain musical note, depending upon the length of the fork and its other physical dimensions. This is the principle upon which the tuning fork timer, which has helped to solve many of Uncle Sam's intricate wire problems in electricity, operates. To one leg of the vibrating tuning fork there is attached an electrical contact which controls a second light image in front of the moving tape and at regular time intervals, this auxiliary timing circuit is closed so as to give spots of light on the paper tape at definite intervals, so that it becomes a simple matter to determine just how many pulsations of the galvanometer string, and in turn the current passing thru it, have taken place in a given space of time. These tuning fork timers are electrically operated in a very ingenious manner. The electromagnet is placed between the limbs of the tuning fork, and by means of a contact placed on one of the limbs, the magnetic circuit is made and broken many times per second, in exactly the same manner as the movement of ordinary vibrating bell functions.

The electrical tuning fork timer, as here described, has been used during the war in solving difficult problems in connection with harbor and coast-defense work, etc. The accurate periodic timing and the closing and opening of an electric circuit by this form of device, have proven very useful in many acoustic or sound problems on which they were engaged to the scientists connected with the Naval Advisory Board and the National Research Council, which covered the recording of sounds from coast defense and warship guns over considerable distances for the purpose of determining by *sound ranging* the distance at which a gun was located when it was fired, etc. Also much study was carried on during the war on the behavior and performance of various calibres of guns by detecting sound and other resultant characteristics whenever the gun was fired. In such work as this, the apparatus here shown, or similar apparatus, proved very useful, and in fact invaluable.

The United States Signal Corps Laboratory developed a great many new and novel instruments during the war. Some of these were not only ingenious and radically new both in conception and design, but marked a new era in scientific apparatus, especially that class of instruments which would lend themselves to use in the field where it is usually considered impossible to design an instrument of extremely sensitive nature, which will possess the proper qualities of high sensitivity and ruggedness so as to withstand rough usage.



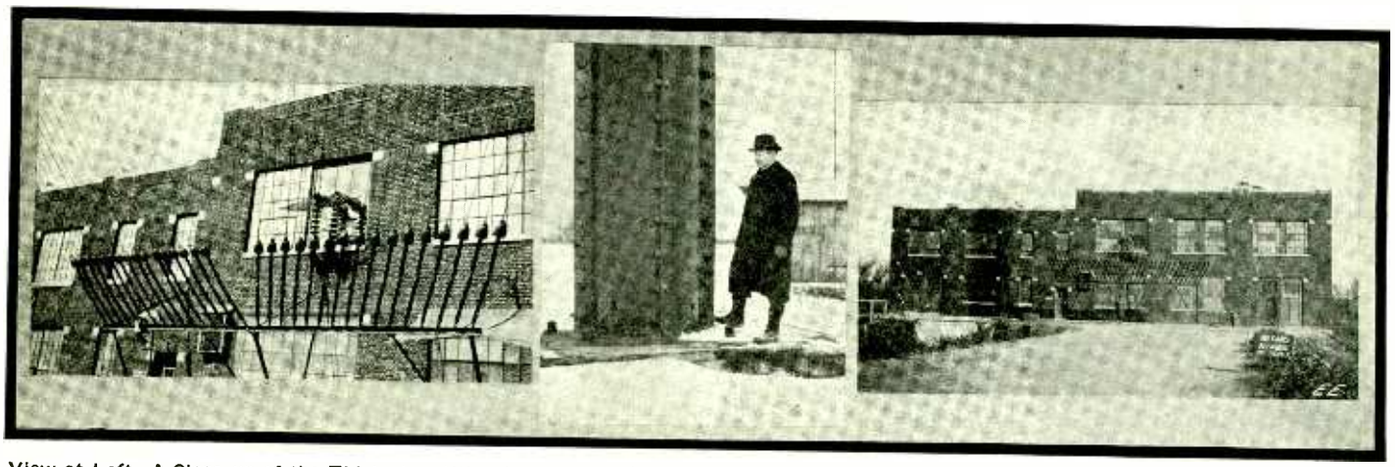


Photo © by Press Illustrating Service

The Accompanying Photograph Shows an Ingenious Recording Galvanometer and Electric Tuning Fork Timer as Used by the U. S. Signal Corps In Studying the Velocity of Sound of Large Guns and for Other Purposes Connected with Harbor and Coast Defence. The Recording Galvanometer Employs a Paper Tape Prepared by a Special Process, On Which the Light Image Reflected from the Moving Galvanometer Is Photographically Recorded. The Paper Tape Is Afterward Past Thru a Chemical Bath Which Develops the Image In the Same Manner as Photographic Prints Are Exposed and Developed. The Tuning Fork Carries an Electrical Contact On One of Its Prongs, and It Is Caused to Vibrate at a Constant Period by an Electromagnet Placed Between the Prongs, the Circuit of Which Is Opened and Closed by the Vibration of the Fork Itself.

View at Left—A Close-up of the Thirty-two Wire Antenna Lead-in Entering the New Brunswick Station. Center—Mr. Alexanderson Standing at the Base of One of the 400 Foot Aërial Masts. Right—General View of Antenna Side of New Brunswick Trans-Atlantic Radio Station, Thru Which Station Secretary Daniels Talked by Wireless Telephone to Europe.

"Hello Europe"—Via Radio

By CHARLES M. RIPLEY

The powerful wireless telephone and telegraph plant at New Brunswick, N. J., described in full detail by an engineer who visited the plant—Why "N. F. F." (New Brunswick's call) called "P. O. Z." (Nauen, Germany), in war time—How the voice of Secretary of the Navy Daniels was wafted thru space over 2,000 miles by wireless to President Wilson, on board the "George Washington" in Brest Harbor, France—How the voice starts with an initial energy of one one-thousandth watt, which is amplified and boosted thru marvelous apparatus until it leaps forth from the 32-wire, mile-long antenna intensified 100,000,000 times, with the power of 270 horses or 2,700 men, a great, turbulent, seething mass of noiseless electrical energy, which shoots thru the earth and air at a speed of 186,000 miles per second! A modern express train, traveling at a mile a minute, is like the lowly snail by comparison.

WITH the outbreak of war an impenetrable curtain of censorship was dropt between the public and many of the world's activities. But, at fever heat, like the stage hands in the cosmic theatre, the world's scientists and inventors have been surpassing themselves in setting the stage for the showing of a new scene.

The Curtain Rises.

Now the curtain begins to rise on this new scene which will tell us a romantic story of accomplishment, out-rivalling the imagination of a Jules Verne. It discloses a great transoceanic wireless telegraph station, providing daily communications direct to our armies, with our Allies in London, Rome and Paris—and, what is most surprising of all, our *communication direct to Germany.*

Late in October, 1917, the Washington key which actuates the great wireless station in New Brunswick, N. J., clicked off

. - - . - - - - - . . . - . - . . . - . . . - .

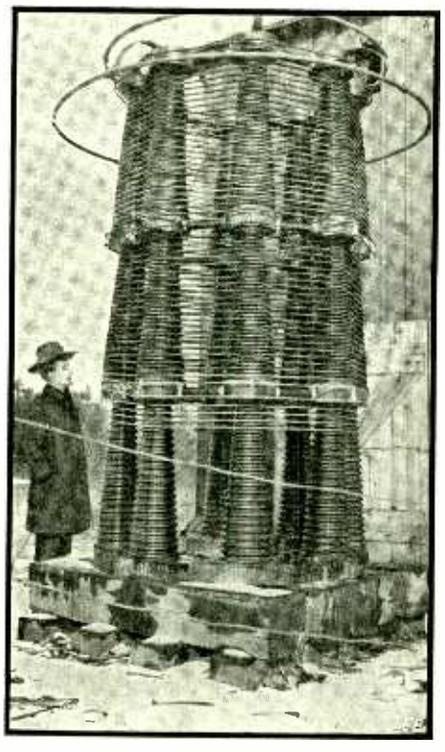
This translated from the telegraph code into the alphabet reads:

P — O — Z — DE — N — F — F

And then in quick succession:—

"POZ—POZ—POZ— de —NFF—NFF—NFF"

This fairly electrified the men in the station: "Washington is calling Germany direct"—SOMETHING EXTRAORDINARY!!!



"POZ" is the call for the Nauen station in the outskirts of Berlin, and "de NFF" meant "from New Brunswick, U. S. A." Thus all diplomatic precedents had been shattered by direct communication between two nations at war! Shortly the message came from Nauen that they were in receipt of the call, and according to gossip the German operator said, "Your signals are fine, old man."

Then followed the historic note of President Wilson demanding the abdication of the Kaiser, stating that the American Government will not negotiate with any but the German people direct. So, from the very beginning, the negotiations leading up to the armistice were conducted thru the New Brunswick, N. J., Naval Radio Station.

Other achievements of this station are numerous; out of 44,640 minutes in the month of January, 1919, the New Brunswick station in the 41,961 minutes of its operation rendered some of the following services:

First—Every day New Brunswick communicated with San Francisco and San Diego, Cal.

Second—Every day New Brunswick communicated with Admiral Sims' flagship in British waters.

One of the Gigantic Tuning Coils Used on the "Multiple Tuned Antenna" Devised by Mr. Alexanderson, the Engineer Who Developed Trans-Atlantic Radiophony to a Practical Basis.

Third—Every day New Brunswick signals are received in Paris, Rome and Wales.

Fourth—So clear are these signals that the ordinary receiving sets on battleships in various parts of the world get these messages. It has been frequently reported that the small portable field sets in France have received the New Brunswick messages.

Fifth—For practically a year a daily International Press service was transmitted thru this station; thereby making American opinion known all over the world—particularly among Germany's dissatisfied allies.

Sixth—Secretary Daniels "spoke" to President Wilson thru the New Brunswick station while on board the *George Washington* in the middle of the Atlantic Ocean.

Seventh—And the wireless telegraph of the "George Washington" receives New Brunswick messages continually and keeps President Wilson informed of world and home events while on the high seas.

Such is the work done by this station.

Here is the stage-set, the curtain of censorship lifts still higher and discloses the station. A country road which swings in close to the Raritan River, which parallels the old Delaware and Raritan canal. Two old-fashioned canal boats are being towed by three mules. They suggest the days of hoop-skirted ladies in 1812, with ardent gallants in knee breeches and silk stockings dancing attendance and quadrilles. The effect is heightened by the stooped old gray-haired driver, trudging thru the red mud beside the horses.

In the distance are seen the thirteen giant 400-foot steel towers of the U. S. Naval Radio Station piercing the sky—their insulators glistening in the Spring morning's sun.

What a contrast—the most powerful radio station in the New World, flashing messages thru the skies to our armies in Europe, and the old canal boat passing close to the weird building. A century and a half stretched its wonderful history between that old unpainted barge and this modest red brick building bristling with

A 100 Horse-Power Voice

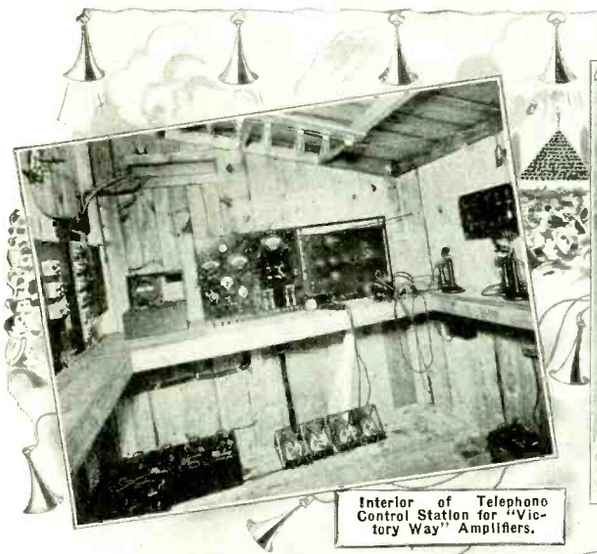
By JEFFERSON WILLIAMSON

A PRACTICALLY unlimited range for the voices of orators addressing outdoor crowds is now made possible by the introduction of what is called the *loud speaking* telephone. This device was used by speakers thruout the recent Victory Liberty Loan Campaign at "Victory Way" in New York City. "Victory Way" was a section of Park Avenue, five blocks in length, just north of the Grand Central Terminal. It had been specially decorated and otherwise elaborately fitted up as a "show place" which was meant to be the center of outdoor activities on behalf of the sale of Victory Notes. Each day several programs were presented at the "Way" and by means of the loud speaker the orators and musical entertainers were distinctly heard at all parts of the "Way," regardless of the fact that the line of fire of the voice of the average orator normally is only about eighty feet. In other words, without the loud speaker, the average orator could convey his ideas at a closely packed outdoor meeting to only about *five thousand* persons. The loud speaker, with its five-block range, made it possible for *tens of thousands* of people to hear the voices of the speakers intelligently.

But the range of the loud speaker is practically limitless. The farther in any direction your audience extends, the more telephone receivers of the loud speaker variety you use. The size of the audience does not matter if the orator speaks clearly and distinctly, and an orator is not an orator unless he does so speak.

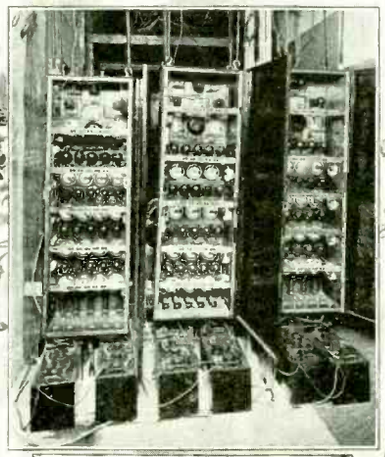
Mrs. Carter Glass, wife of the Secretary of the Treasury in Washington, D. C., was the principal speaker at the opening ceremonies of "Mothers and Wives Day" at "Victory Way." Mrs. Glass spoke over the long-distance telephone from the Capitol and her words were distinctly transmitted to every person on the "Way" by means of the great receivers hung at intervals over the heads of the crowd. Mrs. Glass was followed by Mrs. Vincent Astor, who spoke from the platform at "Victory Way" into the transmitter, which carried her words to every woman in the crowd.

The crowds in "Victory Way" were thrilled one night by speeches from officers in the Great Naval Dirigible 34, which flew over the Way from the station at Rockaway Point. The words of the man in the air were carried distinctly to the waiting throngs thru the receivers of the wireless telephones overhead.



"Hello," came the message from Lieutenant Gilbert Douglas in the airship.

"Hello," was the answer from the speakers' platform, while every person on the Park Avenue plaza hurried to join one of the groups under the receivers.



"We hope every man and women in 'Victory Way' will buy a Victory Note," was Lieutenant Douglas's parting message as the great aircraft turned her course homeward.

It is not necessary for the orator to be in front of his audience. He can be hundreds of miles away and yet be heard distinctly. For instance, each day the crowds on "Victory Way" heard at least one address transmitted from Washington. Among these speakers were Secretary of War Newton D. Baker, General Peyton C. March, and other high governmental officials. And at the close of their addresses the speakers in Washington were able to hear the applause of the New York crowds at "Victory Way." Also, a message delivered by wireless telephone from the U. S. Dirigible C-4, of the Rockaway Naval Air Station, as it hovered five thousand feet high over the East River, was transmitted to all parts of "Victory Way" by means of the loud

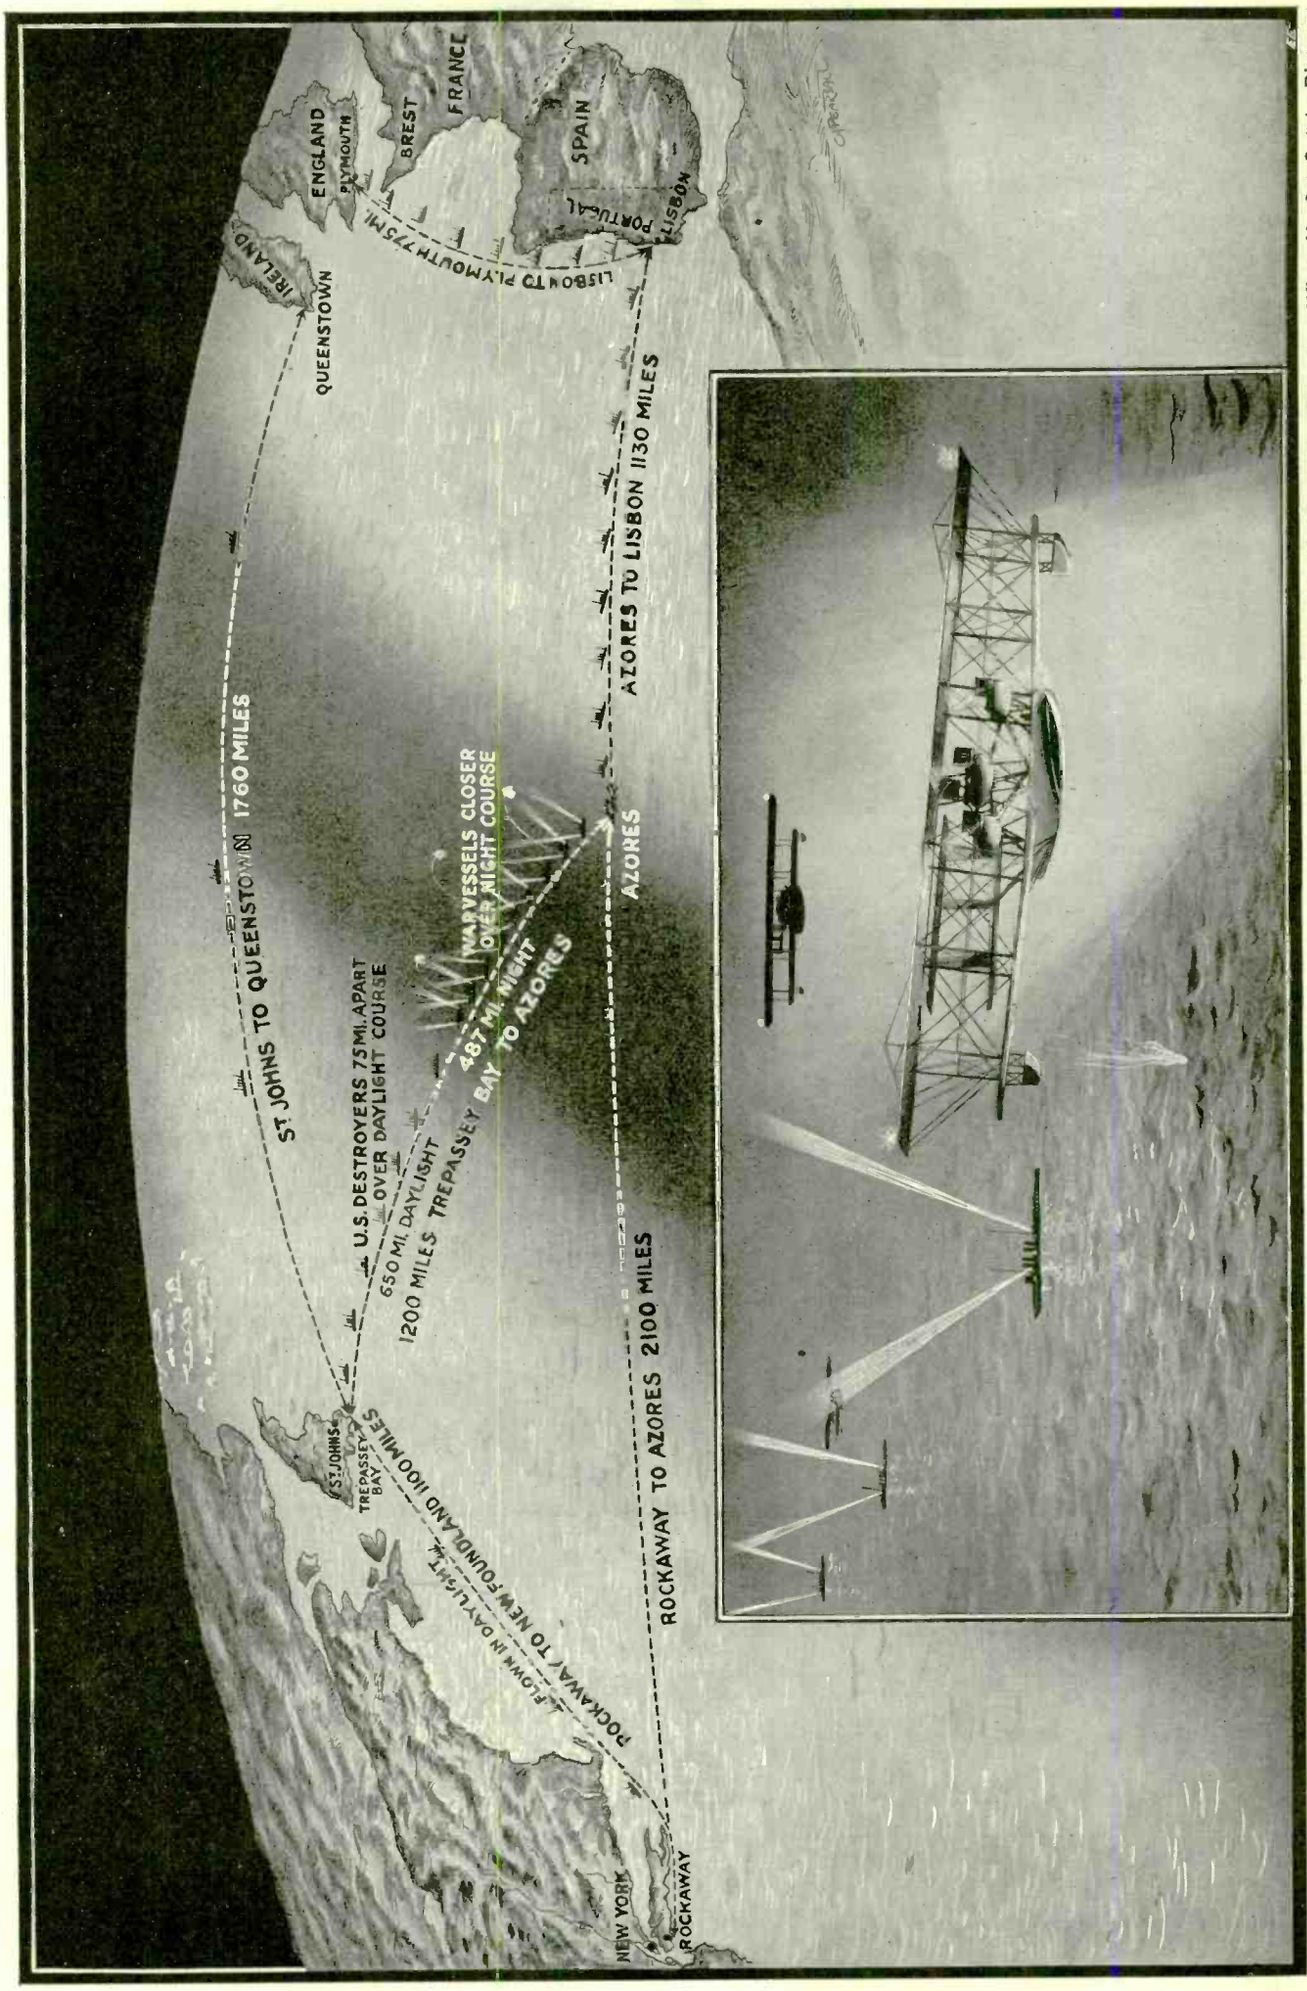
Flying Across the Atlantic

By H. WINFIELD SECOR

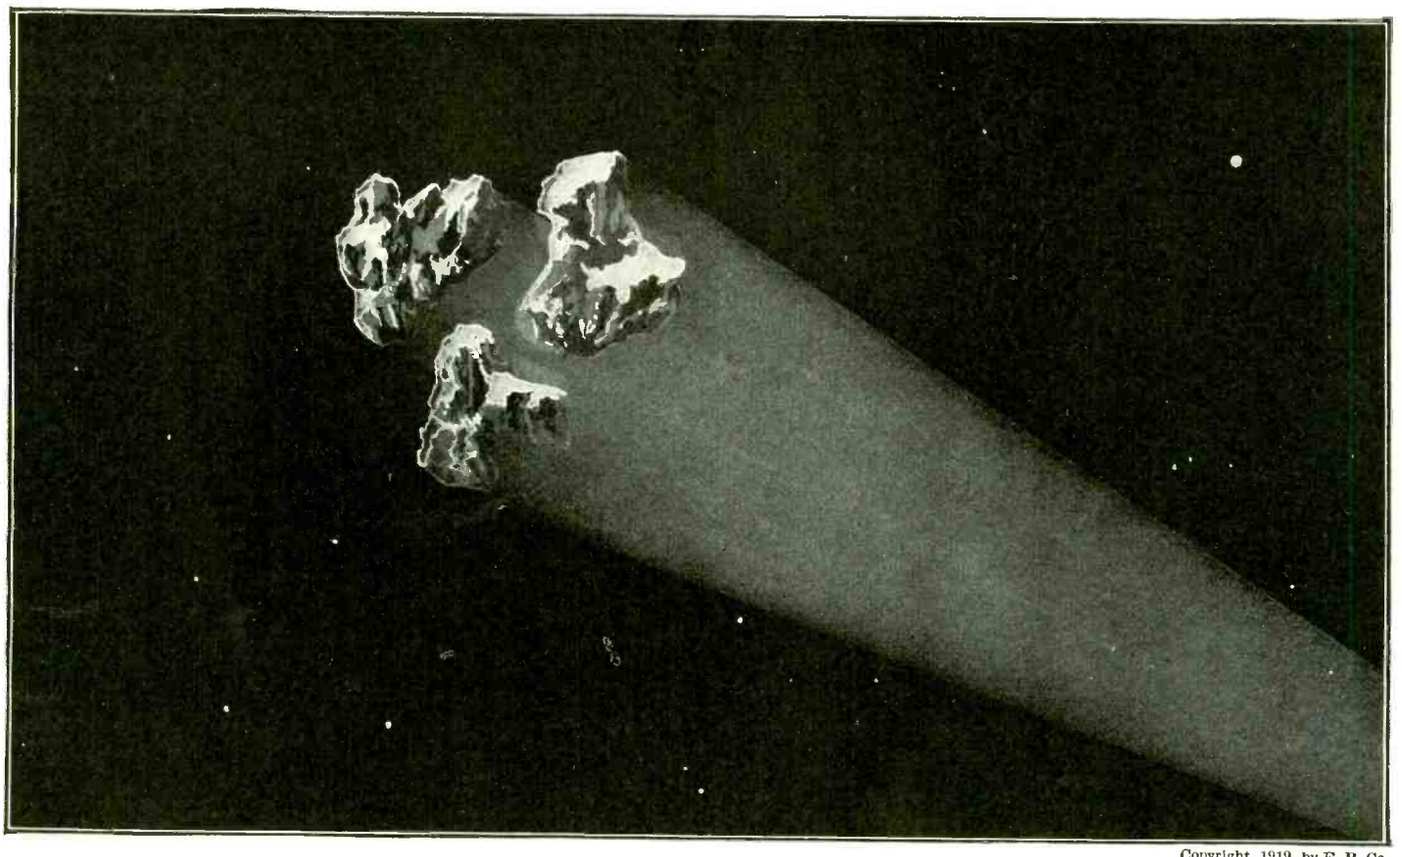
TRANS-ATLANTIC flying has been a dream among aëronautical enthusiasts for many years, and we of the present generation are indeed fortunate in seeing this great feat of aërial engineering and exploitation carried to a successful conclusion by the U. S. Naval seaplane NC-4. At the same time we cannot help but pause and give honor to Lieut. Harry G. Hawker, the daring young English pilot who undertook to fly the Atlantic Ocean over a course which was not even covered by the regular ocean steamships, let alone marked by even a single English naval or other ship. Hawker demonstrated that he had unlimited faith in his machine, which was shared by his navigator, Lieut. Commander McKenzie Grieve, R. N. This trip as planned averaged from 1850 to 2000 miles, and was to have required from 22 to 26 hours of flight.

In considering the trans-Atlantic flight we are, after a little philosophizing on the subject, bound to be confronted with the three principal methods of crossing such a great span as this, i.e., with respect to the type of machine which should be employed. The U. S. Navy has shown that its undoubted faith in the large pontoon form of seaplane was based on sound logic and correct scientific design. As an example of the efficiency of this type of flier for such form of travel over vast water distances, the NC-3 has shown that it can land on the ocean and stand considerable buffeting about without sinking for several days.



Types of Trans-Oceanic Aircraft

The Three Principal Forms of Aircraft Proposed for Trans-Atlantic Flight.



Let us take up the three distinct types of aircraft suitable for trans-Atlantic flight, each of which has been or soon will be tried for bringing the Old and New Worlds closer together. The first type we will consider principally because it seems to have a slight chance of carrying its passengers safely across the 2000 miles of watery deep, is that employed by Hawker and his navigator, Grieve. Lieut. Hawker's airplane was, to begin with, of the *land-going type* and not adapted in any way to oversea travel. Many people have asked why he should have ever thought of starting out with a 'plane of this type on such a long and hazardous trip over the vast ocean span, on the greatest aërial feat ever attempted in the history of flight by man. The reason for choosing this form of 'plane was, primarily, that he was thoroly familiar with it from considerable war experience in Europe, and also there was no useless weight being carried such as is occasioned when any form of pontoon is attached. Lieut. Hawker had the right theoretical idea, but he carried it too far, it would seem to us now. Not only did he choose a land-type 'plane, but he had the under-running gear, comprising the cradle and wheels on which the 'plane traveled over the ground in starting, specially arranged with a trigger release device, so that once he got in the air and started oceanward he could, by the pull of a lever, disengage the running gear so as to reduce the weight of the 'plane

(*Continued on page* 245)

The Accompanying Illustration Shows Us Vividly a Few of the Outstanding Features of a Trans-Atlantic Flight—the Greatest Aërial Feat of the Age. Like Columbus When He Set Out to Discover New Lands, with His Three Tiny Ships, So the U. S. Naval Birdmen Flew Away from Trepassey Bay on the Afternoon of May 16th. Of the Three Giant Seaplanes to Start, the NC-4 Alone Completed the Trip on Schedule. The NC-1 Was Forced to Land on the Water—the Crew Was Picked Up by a Vessel. The NC-3 Also Landed on the Water Due to the Heavy Fog and After a Day and a Night of Floating on the Water, It Came Into Ponta Delgada, Azores, Under Its Own Power. The NC-4, the First Heavier-Than-Air Flying Machine to Cross the Atlantic Ocean, Will Undoubtedly Be Preserved and Placed on Exhibit in the Smithsonian Institution at Washington, D. C. The NC-4 In Its Flight from Trepassey Bay to Lisbon, Portugal, Covered a Distance of 2,150 Nautical or 2,506.9 Statute (Land) Miles In 26:47 Hours actual Flying Time, or at an Average Speed of 80.3 Nautical Miles. The Three Seaplanes Left Trepassey at Sunset on May 16, and the NC-4 Reached Lisbon Soon After Noon on May 27, the Eleventh Day After Its "Hop" from Newfoundland. The Official Trans-Atlantic Flight Ended with the NC-4's Arrival at Lisbon. The NC-4 and Her Original Crew Then Proceeded to Plymouth, England, Where They Were Officially Congratulated and Welcomed.

For a Long Time Astronomers Have Been Puzzled on Account of the Variability of the Light of Many of the Asteroids. These Small Heavenly Bodies Measuring an Average from 3 to 5 Miles in Diameter Are Nothing But Huge Rocks Hurtling Thru Space Along Well Defined Orbits. It Is Now Believed That the Variability of the Light Is Caused by Two or Three Asteroids, Very Close Together, Revolving Among a Common Center. Our Artist Has Shown in This Illustration How a Small Cluster of These Asteroids Would Appear When Viewed from a Distance of About Ten Miles. The Three Bodies Shown Average from 3 to 5 Miles in Diameter.

Popular Astronomy

By ISABEL M. LEWIS

Of the U. S. Naval Observatory

Astronomical Facts For All

FOR the past year Mrs. Lewis has presented a series of very fine astronomical articles to the ELECTRICAL EXPERIMENTER. We are happy to say that we have renewed our arrangement with Mrs. Lewis for another year, and we believe that our readers will welcome the announcement.

In the past Mrs. Lewis has written a monthly article covering only one subject. For the coming year, this arrangement will be slightly changed, and we will endeavor to show every month a variety of articles—"Astronomical Facts for All." In addition to this, we have opened a Question and Answer department which is starting in the present issue. We invite our readers to send in their questions on astronomical subjects which Mrs. Lewis will answer monthly.—EDITOR.

1. Asteroids and How They Are Discovered.

ONE is apt to picture the asteroid seeker painstakingly sweeping the heavens with his telescope to discover a new asteroid or comet. As a matter of fact astronomers spend very little time searching for new asteroids or comets these days when so many other problems are demanding attention. These heavenly bodies are now usually picked up photographically.

The comets are always welcome and interesting visitors, the discovery of a new asteroid is not apt to arouse any marked enthusiasm in the astronomer's heart, despite the fact that occasionally an asteroid has turned out to be an important tho tiny member of the sun's family—as, for instance, Eros, an asteroid only a few miles in diameter that comes within thirteen million miles of earth at times and therefore furnishes a very valuable means for determining the distance of the earth from the sun. Approximately one thousand asteroids have now been discovered, and to name and keep track of these troublesome little members of the sun's family is a tremendous task, especially since they are subject to so many perturbations from the larger members of the sun's family, in particular Jupiter. It is only the hope of finding out a few valuable facts from the exceptional asteroids that keeps the astronomers at the task of caring for this troublesome family of asteroids.

If a photographic plate is fastened to the eye end of a telescope and the sidereal clock work of the telescope started so that the telescope will follow the stars, the stars will be immovable in the field and their images will be sharp points of light on the plate, but any object within the field of view that is moving relative to the earth will leave a short trail of light on the plate owing to its motion during the period of the exposure of the plate, which is usually two or three hours.

Practically all asteroids and all periodic comets whose returns are predicted are discovered by this method. Whether the body is a faint comet or an asteroid, additional plates and an approximate computation of its path will decide.

The four largest asteroids, Ceres, Pollas, Vesta and Juno, are respectively 485, 304, 243 and 118 miles in diameter. These are the values found by Barnard as a result of measurements with the 36-inch telescope of the Lick Observatory. A few more of the asteroids may exceed one hundred miles in diameter, but the great majority are simply huge rocks five miles or less in diameter. These small bodies have such a weak gravitational attraction that they are unable to hold an atmosphere and as a result there can be no form of life, either animal or vegetable, on even the largest of them.

Various estimates have been made of the total mass and bulk of the asteroids. Their average density has been estimated as about equal to that of the earth's surface crust. The great mathematician and astronomer, Leverrier, the discoverer of Neptune, proved that the total mass of matter between the orbits of Mars and Jupiter, where the asteroids are to be found, could not exceed one-fourth of the earth's mass, and later computations reduced this to one-one hundred and fifteenth of the earth's mass. As the combined mass of all the asteroids so far discovered falls far below this value there are probably thousands of small asteroids still undiscovered, tho it is very unlikely that any asteroid whose diameter exceeds one hundred miles has escaped detection.

As the mass of Mars is about one-tenth

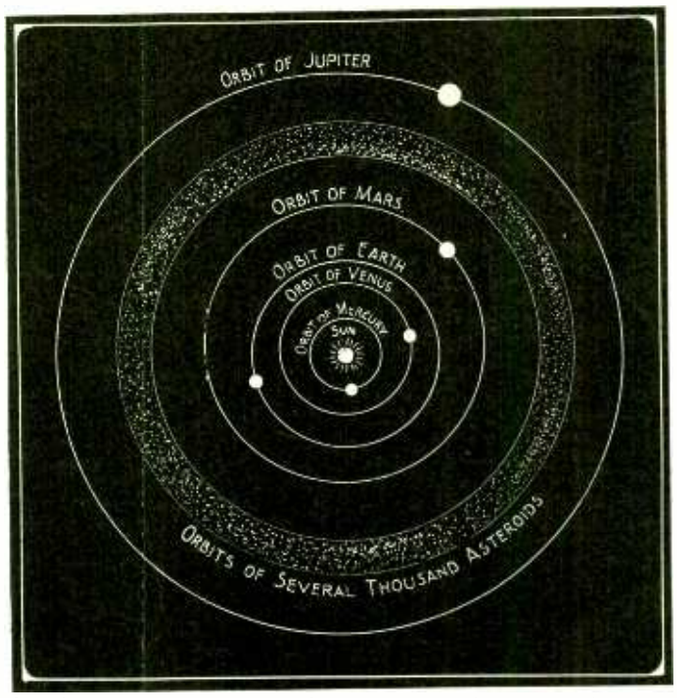
and the mass of Mercury about five one-hundredths that of the earth, it is evident that all the asteroids combined could not furnish enough material to fashion a planet that would approach even the smallest of all the planets, Mercury, in size.

The orbits of the asteroids differ greatly in size and form and in inclination to the ecliptic. Some are almost perfect circles, others greatly elongated ellipses. Their inclinations to the plane of the earth's orbit vary from zero to thirty-five degrees. In this respect they differ greatly from the orbits of the planets which lie very nearly in the same plane.

It has been suggested that variability in the light of many of the asteroids may be due to a difference in the reflecting power of different portions of their surface or to irregularities of form. Unlike the major planets, the asteroids are not spheres but simply jagged rocks, huge mountains hurtling thru space, whirling round and round on their axes as they journey about the sun. Possibly, as some have suggested, they may be the larger fragments of periodic comets of unusual size that have in the course of ages been shorn of their appendages. This might account for the suspected existence of double or multiple asteroids, in which two or more of these huge rocks are grouped so closely together as to appear as one in the telescope. This would also account for the variability in the light of some of the asteroids.

This Shows How Asteroids Are Discovered, Not Thru the Telescope, But on the Photographic Plate. The Stars Standing Still, Any White Streak Left on the Plate Must of Necessity Be Either a Planet or a Comet.

2. Shooting Stars.



"SHOOTING stars" is an unfortunate name for the small masses, weighing usually only a few ounces, that enter the earth's atmosphere from outer space, are ignited by friction with the atmosphere, glow brightly for a few brief seconds and then fall to the surface in the form of dust.

It has been estimated that shooting stars or meteors, as they are more fittingly called, enter the earth's atmosphere by the millions every day, only a very small percentage of them being visible to the naked eye at any one place. They fall by day and by night, over land and sea, in polar regions and in the tropics. The snowy wastes of the far north are dusted with the ashes of shooting stars that have been consumed by friction with the earth's atmosphere, which they enter at a speed varying from ten to forty miles a second.

Astronomers quite frequently observe meteoric particles invisible to the naked eye, flitting across the field of the telescope. Some of the larger of these masses weigh several pounds, in rarer instances even several hundred pounds. They are thus referred to as meteorites or fire-balls. These are not entirely consumed by friction with the earth's atmosphere, but after traveling with loud reports and explosions a distance of many miles, fall to the earth's surface.

Comets, it is generally believed, disintegrate gradually into swarms of meteors and the earth and other planets are constantly encountering these fragmentary particles in their journeys around the sun. Periodic swarms are encountered at certain definite times of the year whenever the earth's path crosses the paths of these disintegrated comets.

The study of the origin and nature of meteors forms a most interesting branch of astronomy to which even the amateur astronomer may contribute observations of value.

Showing Where the Orbits of Several Thousand Asteroids (Planetoids) Are Located. Their Orbits Take In the Intermediate Space Between That of Jupiter and Mars. These Little Planets Vary In Size from Three Miles to 485 Miles in Diameter. There Are Undoubtedly a Great Many Thousands Also of Even Smaller Diameter or as Small as an Ordinary House.

Questions and Answers.

1. *How many stars are there in the sky and how do astronomers know the number of the stars?*

The approximate number of stars of each magnitude has been found by counting the number of stars in regions of a certain definite size and then estimating from the result the number of stars of each magnitude in the whole sky.

In speaking of "magnitude" of a star, its apparent brightness and not its true or intrinsic brightness is meant. A star of the first magnitude is, according to the scale adopted, two and one-half times brighter than a star of the next fainter magnitude, the second magnitude, and one hundred times brighter than a star of the sixth magnitude, which is the faintest star visible without a telescope. The exact ratio of one magnitude to the next lower is the fifth root of one hundred, so that a drop of five magnitudes represents a division of the brightness by one hundred. A sixth magnitude star has only one hundredth the brightness of a first magnitude star and an eleventh magnitude star only one hundredth the brightness of a sixth magnitude star or one ten-thousandth the brightness of a first magnitude star.

There are in the whole sky only five thousand stars visible without the aid of a telescope; that is, five thousand stars of the sixth magnitude or brighter. Since only one-half of the sky is visible at any one point and since faint stars near the horizon are invisible on account of the greater density of the earth's atmosphere in this direction, there are only about two thousand stars to be seen at any one point on a clear, cloudless night, though one receives the impression that an infinite number of stars exists.

A small three-inch telescope will show stars down to the ninth magnitude and there are two hundred thousand stars brighter than the ninth magnitude.

Fainter stars are far more numerous and it has been estimated that there are approximately *fifty-five million stars* in the first seventeen magnitudes.

The forty-inch Yerkes refractor will show stars of the seventeenth apparent magnitude and the great one hundred inch Mt. Wilson reflector stars of the twentieth magnitude. This represents the limit of telescope power at the present time, and it is doubtful if it ever can be greatly surpast.

It has been estimated on the basis of counts of stars in sample regions that there are three hundred million stars in the sky within reach of the great reflector.

It is assumed that there is a definite limit to the number of stars within our own sidereal system, for it is evident from actual star counts that the ratio of the number of stars of one magnitude to the number of stars of the next fainter magnitude falls off rapidly for the fainter stars. By the time the seventeenth magnitude is reached a falling off of fifty per cent. in the ratio is reached, which is an indication that the total number of stars is approaching a finite limit provided, as is generally assumed, there is no marked extinction of light in space. It is conceivable that there may be other stellar systems far beyond our own, however, and light from such exterior systems may be in some manner shut off from our own. Nothing is known either to prove or disprove this belief.

Some astronomers have devised formulas based on star counts to ap-

Showing the Comparative Size of Some of the Planets and the Total Volume of All of the Asteroids. Ceres, Pallas, Vesta, and Juno Are the Largest of the Planets. Ceres, Having a Diameter of 485 Miles, Juno 118 Miles Diameter.

Electric Fans for Madame Holstein

Madame Holstein in Her Glory—180 of Her Enjoying the Cool Breezes from the Electric Ceiling Fans as Installed in a Large Southern Dairy. As Abie Kabibble Would Say—"Some People's Cow-Barns Are Better Than My Parlor, Ain't It?—the Wery Idee."

The cow is distinctly a feminist. Pigs aren't: they don't care. But Madame Holstein is as exacting in her tastes as the most pampered female of the species. Doesn't it strike one as a little ultra-fashionable for 180 cows to drink out of individual fountains while electric fans waft the cool breeze over their aristocratic backs? Mr. Asa D. Chandler, Jr., of Atlanta, Georgia, doesn't think so. He says that his cattle show the results, and he proves it by referring to "Lizzie," who since her entrance into the lap of luxury produces 44 quarts of milk daily.

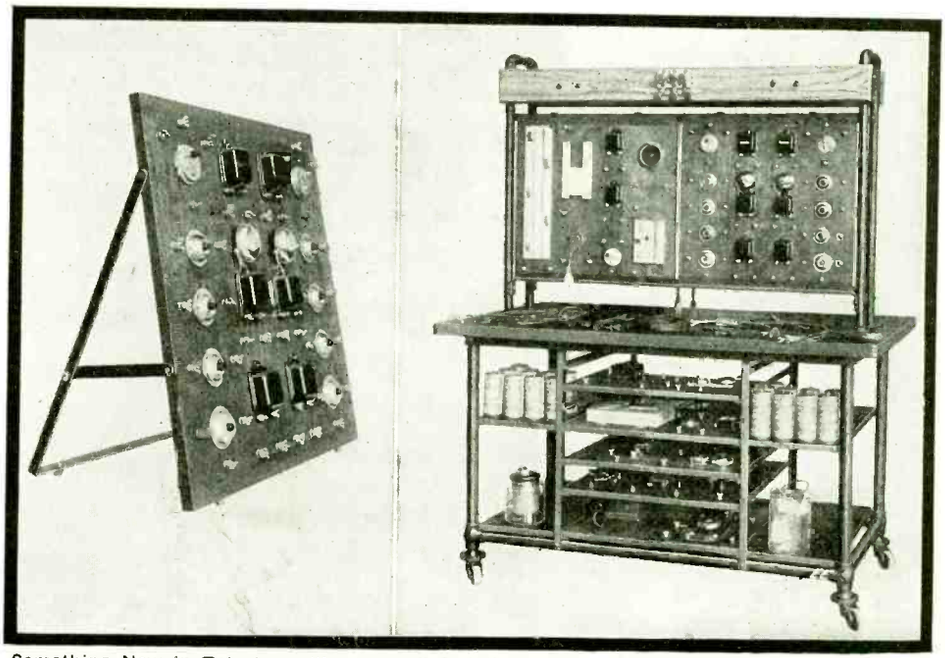
The barn is provided with concrete floors, wooden blocks, *electric lights, fans* and milking machines, steel frame stalls, novel drinking fountains, concrete feed troughs, electric equipment for the silo and bottling the milk. The Farm has a colony of 180 full-blooded registered Holstein cattle.

Electric *Ceiling Fans* are shown cooling the atmosphere in summer and ventilating in winter. The electric lights are also shown. "Lizzie" has a private drinking fountain. There is always a small amount of water in the bottom of the cement cup to entice her. When she makes the attempt unconsciously, she forces the valve open and hence always has fresh water.

The green corn for ensilage is cut with the aid of a 15-H.P. electric motor, and is blown thru a conveyor into the top of a 40-foot Silo.

Just as soon as the milk arrives at the milk house, it is strained and past over a cooler until it reaches the proper temperature. From here it passes to a bottle filling machine, where the bottle is automatically filled and sealed. (Photo courtesy Westinghouse E. & M. Co.)

Instructor Telephone Boards for Students



There has long been a demand on the part of high school physics instructors the country over, for a practical method whereby the principles of *telephony and telephone wiring* may be taught in the High School courses. Hitherto it has been extremely difficult to secure proper apparatus, sufficiently durable for laboratory purposes, and inconvenience and expense of installing the necessary instruments for successful instruction in telephony has been very often the cause of the absence of this important branch of instruction in many schools.

To overcome the objections to the old method, and furnish a substantial, practical set of telephone apparatus for the laboratory, the telephone board here illustrated has been designed.

One of the most important features from a practical standpoint of the telephone units is the method by which the contacts are made for interior wiring of the instruments, Ordinarily in laboratory instruments of this character the wiring must be attached directly to the delicately constructed terminals of the apparatus itself, and naturally thru the wear and tear of laboratory usage they quickly become worn out and broken. By the "Instructor" method, these connections are made, not to the instruments themselves, but to substantial wing-nut terminals, which are in turn permanently wired to the proper terminals on the instruments. In this way the life of the apparatus is indefinitely prolonged, as well as much time and effort saved by the making of quick, efficient connections.

There are two types of the bracket form of intercommunicating telephone boards. The single form of board, size 24" x 24", contains two sets of instruments for experiments in intercommunication, while the other type has four telephone sets, permitting the wiring of two, three, or four intercommunicating systems on the same unit. The frame of this latter unit varies from the single bracket board in that it is constructed so as to contain four separate unit boards 9" x 24" in size.

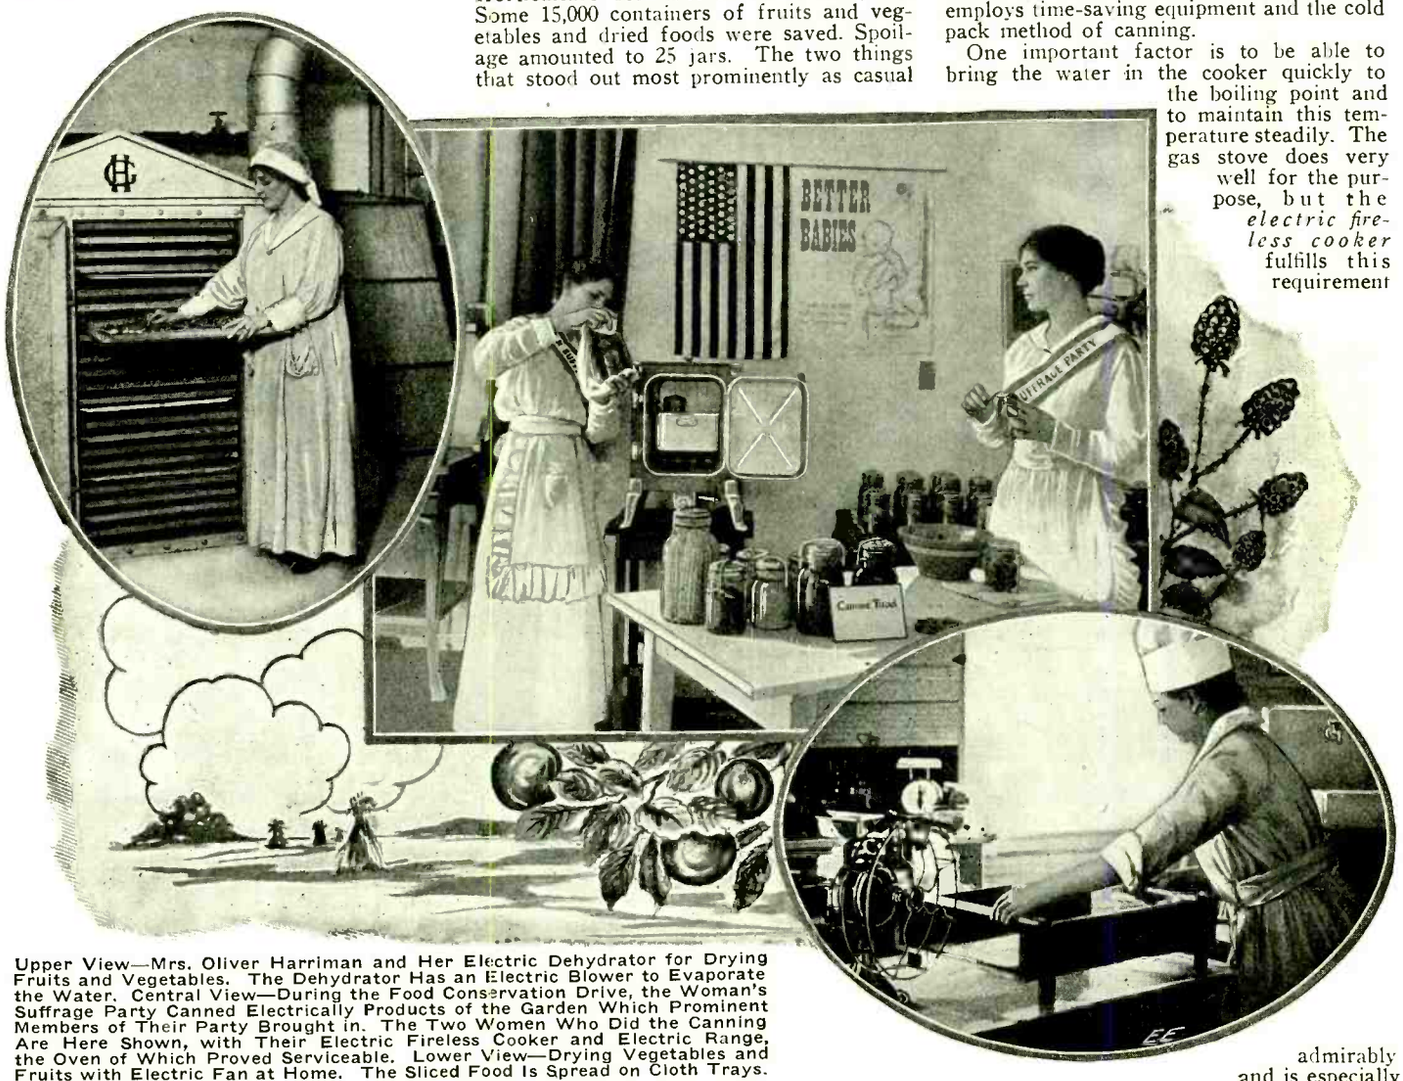
In connection with both of the bracket units there has been designed a *portable table*, substantially constructed with an iron pipe frame, and a heavy, stained table top.

Something New in Telephone "Instructor" Switch-boards. The Students Have to Make the Proper Connections on the Face of the Boards. The Best Idea for Schools That Has Been Brought Out in Some Time.

"The Kaiser is Canned—Can Food"

By GRACE T. HADLEY
SOCIETY FOR ELECTRICAL DEVELOPMENT

TO save vegetables and fruits by canning this year is a patriotic duty. War has made the need for food conservation more imperative than at any time in history. America is largely responsible for the food supply of Europe. The American family can do nothing more helpful in this emergency than to can all food that can be canned. In this way, the abundance of the summer may be made to supply the needs of the winter.



The preservation of food stuffs by canning is always food thrift. It effects the saving of a surplus of foodstuffs that would otherwise be wasted, thru excess of supply over immediate consumption. It eliminates the cold storage cost that must be added to the prices of commodities bought during the winter. Of vital importance also, is the fact that it relieves the strain on transportation facilities of the country.

The president of the *National War Garden Commission* tells us in the *Home Canning Manual* that victory must necessarily bring a large increase in our obligation. We must not only produce food as close to the kitchen door as possible, but we must *save* a vast volume of this food for winter use. To save it, we must can it, dry it, or otherwise prepare to have it in readiness for the winter months. Canning and drying, therefore, are as imperative today as if the great world war were just beginning. A country whose people "can" will never be found wanting.

The Demonstration Kitchen in Ambler, Pa.

During the food conservation drive several hundred women worked in the demonstration kitchen at the School of Horticulture for Women in Ambler, Pa. Some 15,000 containers of fruits and vegetables and dried foods were saved. Spoilage amounted to 25 jars. The two things that stood out most prominently as casual factors were poor rubbers and the development of flat sour.

"In spite of quick and scientific work," Caroline G. Peeler states, "*flat sour* gave us some trouble. We looked for the cause at the beginning of the work and followed it right thru the processing but never thought of looking for it at the time when the jars were sitting happily on the table cooling off. In reply to an 'S. O. S.' call, Washington told us to cool those jars quickly and to do this by placing them one foot apart, so that the air could circulate thru and around them. They must not be in a draft, but the temperature must be reduced rapidly. The jars when first removed from the sterilizer can be seen to be bubbling or boiling. If they are placed close together the heat is confined as in a fireless cooker, causing them to keep warm for hours, chemical changes take place and *flat sour* develops."

Upper View—Mrs. Oliver Harriman and Her Electric Dehydrator for Drying Fruits and Vegetables. The Dehydrator Has an Electric Blower to Evaporate the Water. Central View—During the Food Conservation Drive, the Woman's Suffrage Party Canned Electrically Products of the Garden Which Prominent Members of Their Party Brought in. The Two Women Who Did the Canning Are Here Shown, with Their Electric Fireless Cooker and Electric Range, the Oven of Which Proved Serviceable. Lower View—Drying Vegetables and Fruits with Electric Fan at Home. The Sliced Food Is Spread on Cloth Trays.

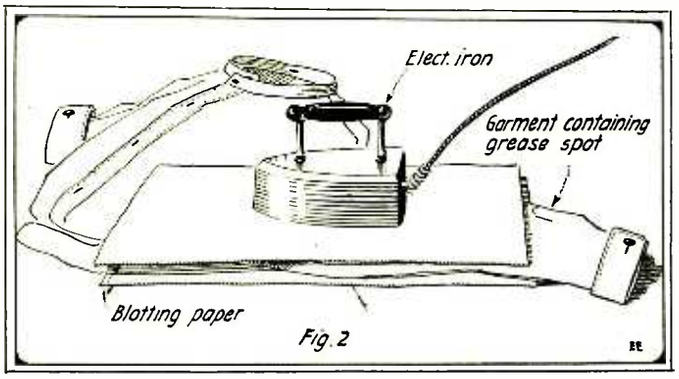
Lamp Socket Canning.

Whether one has a sixteen-acre farm or one of the three sizes of commuter's garden, one is sure to have some surplus products and such products should be either dried or canned. "Can surplus food, but use jars and cans wisely," was the verdict last season in order to save every ounce of available food. The thrifty housewife who heeds the foregoing will find that she has quite a store for winter use, with little labor and slight cost, especially if she employs time-saving equipment and the cold pack method of canning.

One important factor is to be able to bring the water in the cooker quickly to the boiling point and to maintain this temperature steadily. The gas stove does very well for the purpose, but the *electric fireless cooker* fulfills this requirement admirably and is especially well suited to take care of surplus products from a commuter's garden. All thru the season odd lots of vegetables that might otherwise go to waste, may be gathered, canned by the cold pack method and sterilized in an electric fireless cooker which is a lamp socket appliance, easy to operate and a great time-saver.

In New York City during the food conservation drive, the Woman's Suffrage Party canned electrically at one of the headquarters stations. Prominent suffragists brought in the products of their gardens which were canned by two women volunteers and the canned products were then sold for the cause of suffrage. Electric fireless cookers were used for the processing as well as the oven of an electric range.

Home Canning Manual.



The *Home Canning Manual* issued by the National War Garden Commission of Washington should be in the hands of every woman who contemplates canning. It contains all the necessary instructions for canning vegetables and fruits, the princi-

Practical Chemical Experiments

By ALBERT W. WILSDON

Cleansing and Washing Agents

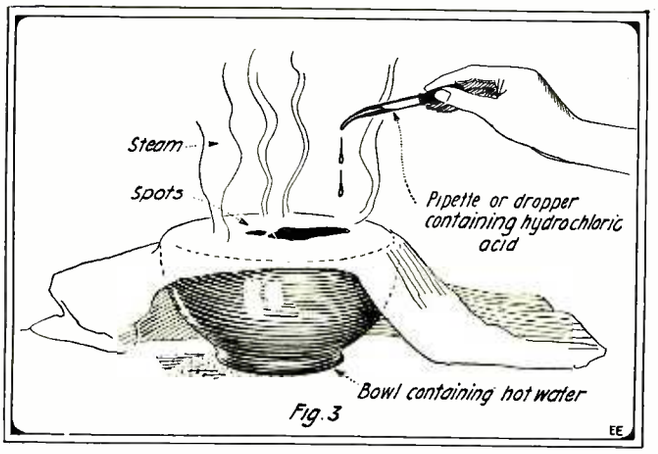

Fig. 2. Left—Method of Removing Grease Spots With a Hot Iron (Electric Iron Very Adaptable) and Two Sheets of Blotting Paper.
Fig. 3. Right—Removing Iron Rust Spots. Place the Soiled Cloth Over a Bowl of Steaming Hot Water. Drop Hydrochloric Acid on the Spots and They Will Come Out.

IT is quite likely that practically every reader has at some time encountered the problem of removing some stain or cleaning some substance, and due to the lack of chemical knowledge of the principles of cleaning, has failed in his object. This subject has such frequent applications that it was deemed of sufficient importance to warrant its presentation in this form. Formulas have been omitted, but if desired information regarding them will be furnished by the writer.

Substances used for cleaning may act either mechanically or chemically to remove the dirt or other substances from clothing. In the use of soap and sand for scouring, there is a combination of these methods, and in fact, when the chemical loosens up the fibers or sets free the dirt, some mechanical process, as the washboard or washing machine, preferably electrically driven as shown in Fig. 1, is required to remove it.

Most of the polishing and cleaning powders on the market depend for their efficiency upon the action of a very finely divided substance like Silica, precipitated chalk, or rouge. These are mixed with some fat or oil. In selecting a polishing material, care should be exercised in selecting one that is so finely divided that it will not *scratch* the metal. Dry sodium Bicarbonat (Baking Soda) can be safely used for cleaning and polishing.

Borax, added to water, greatly aids in the removal of dirt. Most readers are familiar with the household Ammonia, which is used for this purpose. As ammonia forms a soap with the oily matters of the fabrics washed, it is a convenient cleaning agent. A teaspoon of Ammonia to a quart of water is an excellent wash for wood-work, and may be used to brighten carpets or rugs. Much of the household ammonia on the market is of a very low grade, and so it is always advisable to purchase it from a supply house, or if necessary from the druggist.

A cleaning material should not only remove the grease or dirt, but it must be of such a nature that the article cleaned will not suffer injury by its application.

Cleansing Leather and Metals.

In some cases, as with wood, leather, metals, etc., the dirt does not penetrate into the interior, but remains on the surface. In other cases the whole fabric is filled with dust and grease. All polished wood surfaces, except those finished with wax, may be cleaned with a weak solution of Ammonia, or soap, but they should never be treated with a strong alkali solution.

As solvents for grease, either kerosene or turpentine may be used, and ordinarily should be applied with a soft cloth. Painted surfaces, especially in white, may be cleaned with a little whiting (Calcium Carbonat), which may be applied with a piece of cheesecloth. The wood is afterwards washed with water and wiped dry. Painted walls, if painted with oil paints can be cleaned in the same way, but tinted walls, since water colors are used, would be disfigured by this treatment.

Leather may be kept bright and clean by the use of kerosene, or occasionally a little oil. Marble may be scoured with sandsoap, and finally polished with a coarse flannel. It should not be forgotten that marble is Calcium Carbonat, and therefore should never be treated with an acid. Metals can usually be cleaned with a hot alkaline solution or a little kerosene. To clean glass, it may be covered with a paste of whiting, ammonia, and water, and after this is dried this may be rubbed off with a woolen cloth or with paper. Alcohol is used extensively for cleaning delicate glass, as for instance, lenses and microscope objectives. In using alcohol for lenses, great care must be exercised, as the mounting paste or adhesive may be dissolved. In extremely cold weather, when water would freeze, kerosene may be used.

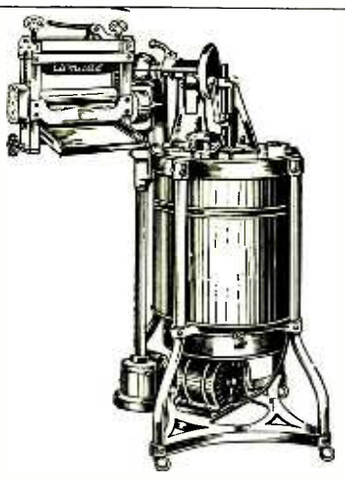

Fig. 1. The Modern Way to Cleanse Clothes Is by Means of the Electric Washing Machine. Many of These Devices Possess Distinctive Improvements Which Make Them Much Superior to Hand Methods.

Dangerous Cleaning Solutions.

Household fabrics are often washed with alkaline solutions or with soap. In some cases Naptha may be used for washing such fabrics. It is to be remembered that in some of the solvents, as Naptha, Benzine, Turpentine, and Gasoline, which are frequently used for cleaning, these vapors are all very volatile, and for this reason *they are dangerous, if employed near a FLAME of any character. These vapors may take fire from a lamp, gas jet, or stove, even at some distance.* Thus it is advisable to do work of this character out of doors if possible. Not infrequently have very serious disasters occurred through failure of the operators to familiarize themselves with the combustibility of the cleansing agents which they employ. Carbon Tetrachlorid is used widely as a scouring and cleansing agent as a substitute for gasoline. Owing to the lack of Hydrogen in its composition, it has the great advantage over the substances mentioned above, of being non-inflammable. In the use of volatile solvents, like gasoline, enough should be used to cover a large portion of the goods, and if possible afterwards washed thoroly with water.

Grease Spots.

To remove stains, spots, and tarnish, the knowledge of a limited chemistry will serve an excellent purpose. As grease is readily absorbed by blotting paper, spots may often be removed from fabrics by placing the goods between two pieces of blotting paper, and then heating with a warm iron, see Fig. 2. French chalk will sometimes absorb the grease, especially if the spots are fresh. Grease may also be removed by the use of hot water and soap, ammonia, or even borax. If there is no danger that these solvents will injure the goods or the colors, it is better to use some solvent such as Chloroform, Ether, Alcohol, Turpentine, Benzine or Naptha. Ether and Chloroform are better adapted to the more delicate fabrics. The troublesome dust spot has usually a neglected grease spot for its foundation. After the grease is dissolved the dust must be cleaned out by rinsing thoroly with fresh liquid or by brushing after the spot is dried.

Removing Paint Spots.

Paints consist of *oil* and *some coloring matter* and *lead or zinc oxids,* thus paint spots should be treated with a solvent for the oil, and then the coloring matter can be brushed off. Fresh spots may be treated

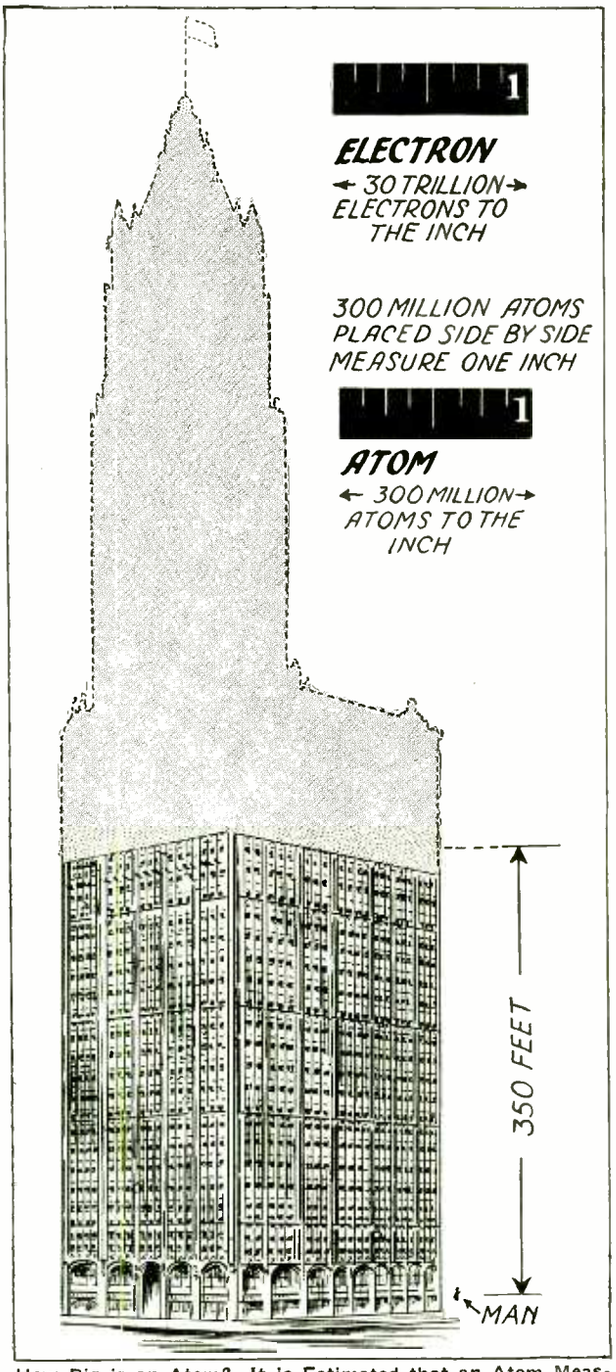
How Big Are Atoms and Electrons?

By L. R. JEWETT

THE study of electrons has recently led to great improvements in apparatus for producing and detecting currents of radio frequency. Doubtless many wireless enthusiasts read about the electron and its behavior in the operation of the electron relay (Audion) but do not know of the characteristics of the electron. The writer will endeavor to set forth some interesting, yet elementary, facts in reference to its characteristics, according to the modern theory of matter.

All bodies are complex structures composed of small particles called atoms and still smaller particles known as electrons. Molecules are groups of atoms and a molecule is the smallest part of a substance which can exist and still retain its chemical properties. For instance, two atoms of hydrogen and one atom of oxygen compose one molecule of water, namely, H^2O. Electrons may be contained in the molecules or free in space between the molecules. None of the particles can be detected by a microscope and the smallest visible particle so far detected with the ultra-microscope is about *twenty-five times the diameter of one of the largest molecules.*



An *atom* is about *one three-hundred-millionth of an inch in diameter.* If the earth were composed of baseballs, it would be an approximate model to a drop of water composed of atoms. In size the *electron* is very much smaller than the atom and it is believed to have a diameter of about *one one-hundred-thousandth that of an atom;* i.e., 1/100,000 of 1/300,000,000 inch, or 1/30,000,000,000,000 inch, diameter of an electron (or there would be 30 trillion electrons to the inch). Thus, if a large building 200 feet square and 350 feet high represented a comparative size of an atom, *an electron would be about the size of the head of an ordinary pin.* Thus the reader may be able to realize the size of the electrons whose performance is so important in many electrical phenomena.

The assumption upon which the electron theory is based is that in every substance, whether charged or uncharged electrically, there exists both positive and negative electricity, distributed on discrete particles. All bodies appear to have large quantities of both positive and negative electricity, usually in equal amounts; thus one charge neutralizes the other and consequently no electricity seems to be present.

The smallest negatively charged particle which can exist in nature and which it is possible to detect is called an electron. Its charge, which is always negative, is less than one billionth of a billionth of a coulomb.

Experiments indicate that the electron is spherical in shape, altho it has not been proven. Its mass is generally regarded now by physicists to be entirely electromagnetic; i.e., it contains a negative charge only and *does not consist of a material substance.*

Electrons are attracted towards all positive charges and repel each other, since they are all of the same charge. There is an attraction between an atom and an electron, but it varies according to the characteristics of the atoms. Attraction between atoms and electrons in non-metals is weak, whereas in metals it is comparatively strong. Thus an electron could move about in a metal with comparative ease. If a stream of electrons is caused to move thru a metal, an electric current results. Therefore, an electric current thru a metal is said to be a stream of electrons moving thru relatively large spaces between the atoms or thru the atoms themselves. The actual speed of the electrons is exceedingly slow, but the rate of transmission of motion from one electron to another electron is very great. This impulse travels one hundred and eighty-six thousand miles per second, but *the electrons themselves may move only a few inches a minute.*

How Big is an Atom? It is Estimated that an Atom Measures One Three-hundred-millionth of an Inch in Diameter. There Are 30 Trillion Electrons to One Inch. If a Building 200 Ft. Square and 350 Ft. High Represented the Comparative Size of an Atom, an Electron Would be About the Size of the Head of an Ordinary Pin. See Comparative Size Man Holding Pin in Illustration.

Interesting Facts About the Electron

Hertzian waves are always produced by causing a charge of electricity to oscillate back and forth, and according to the modern wave theory when this electronic charge vibrates to and fro it radiates electrical waves which go out in all directions in space.

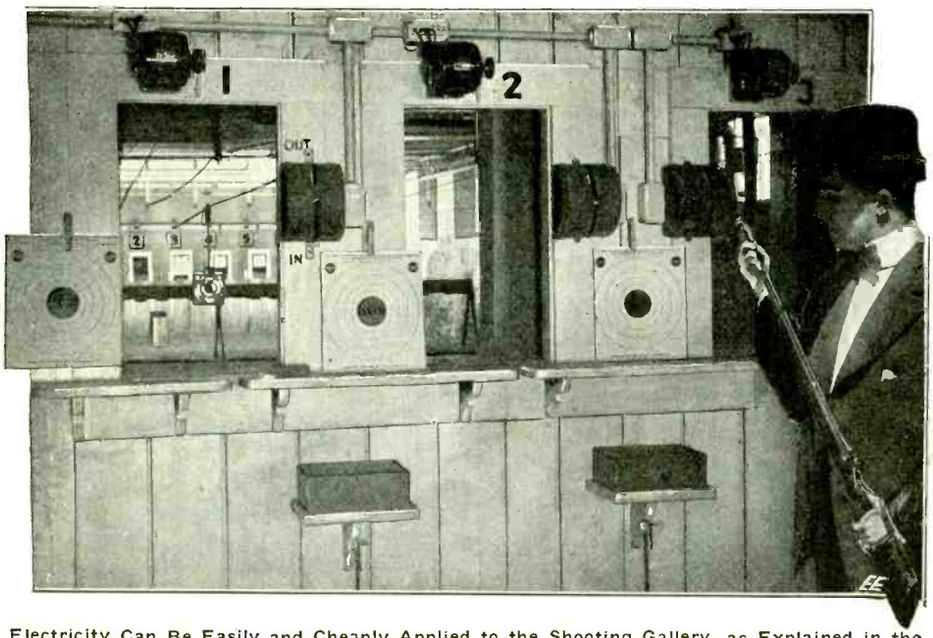
If a metal which contains large numbers of electrons is heated hot, some of the electrons would be given off into space. This is true when the filament of an electron relay or audion tube is heated. Since the plate is positively charged the electrons are attracted to it. Further discussion of the theory of the action of the electron relay or tube will be found in previous issues of this magazine. It is possible to calculate the magnitude of the electron flow from a hot filament.

$$I_B = AT^{\frac{1}{2}} e^{-\frac{b}{T}}$$

Where I_B = Electron current in milli-amperes per CM^2 of filament surface,

T = absolute temperature
$A = 2.5 \times 10^{10}$
B = 52500

A and B are true for a tungsten filament.



There is sometimes a misunderstanding concerning the difference between an electron and an ion. An electron has been defined as an "electromagnetic mass" having a negative charge. An ion is a material mass having a negative or positive charge as signified. Thus, if a tube containing a heated filament is purely a vacuum tube containing no air, it is a purely electronic emission and no ions are present. This is true of the so-called pliotron and dynatron, the Coolidge X-Ray tube, etc. But if a gas of any sort, for example, ordinary air or pure nitrogen is present in any degree in the tube, ions will be present also since the gas is "ionized" by the collision of the electrons and the atoms.

The modern electron theory is playing a very important part in the theory of the performance of different wireless instruments and systems. The above facts will no doubt tend to give the amateur a general idea of what an electron is and its behavior.

Those interested in the study of the electron theory will do well to look up some of the highly interesting articles publisht in back numbers of this journal, as well as such works as Professor Millikan's excellent treatise, "The Electron"; "Conduction of Electricity Thru Gases," by Thomson, and "Nature of Matter and Electricity," by Comstock and Troland. Articles in past issues of this journal: "Cosmic Force," by L. M. Correll, April, 1918; "Can Electricity Destroy Gravitation?" by Nipher, March, 1918; "Modern Physics and the Electron," by Prof. R. A. Millikan, January, 1918; "Does Radiant Light Possess Weight?" by A. R. MacPherson, July, 1917, issue.

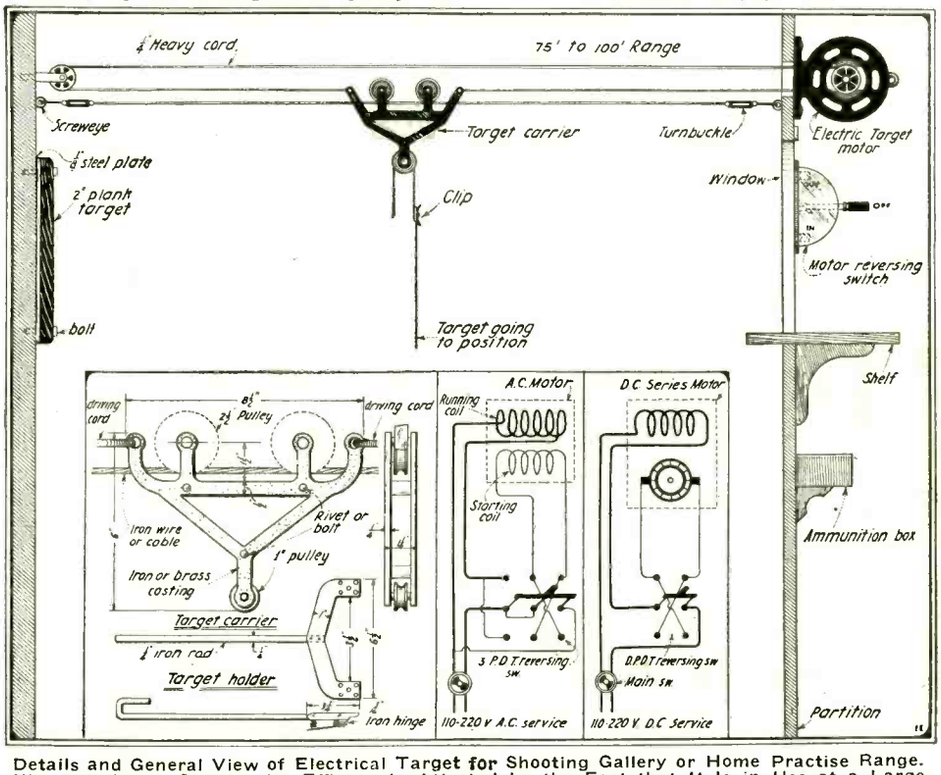
THE CONSTRUCTOR

An Electric Shooting Gallery

Electricity Can Be Easily and Cheaply Applied to the Shooting Gallery, as Explained in the Accompanying Article. The Targets are Carried to and from the Marksman's Position by Motor Operated Cables. The Motors are Reversed by a Simple Switch. The Motors May Be Ordinary 1/15 H.P. Fan Motors. You Can Thus Check Your Own Targets.

IN the ordinary shooting gallery or rifle range it is invariably necessary for someone to replace the targets and also to keep the score where continuous shooting is carried on. Therefore, even with the individual rifle range, it has always been a serious draw-back in that someone had to be employed to change the target and either keep the score in a score book, or else after a given number of rounds to return the target to the marksman. These desideratums have been well taken care of and circumnavigated by a very ingenious electrical scheme which has proven an unqualified success at the rifle range of the Lynn Rifle and Revolver Club, maintained by the employees of the General Electric Co., at Lynn, Mass.

The Lynn Rifle and Revolver Club has about 160 members and the membership is open to all employees who are citizens of the U. S. A. In addition to the Rifle Range, the club has also facilities for pool, billiard, chess, checkers and cards. The whole is installed in the basement of an old office building on Center Street, together with the Bowling Club Alleys.



This electric shooting gallery contains eight stations. The present view was taken from the firing station and shows the small electric motors for driving the target carriers which are type 1/15 H.P.-220 volt-60 cycle motors. These are controlled by double-pole double-throw knife switches with a fiber guard which is also shown.

The accompanying diagrams show how the carrier, which may be made of aluminum or cast iron, wrought iron bar, or even of wood, is arranged to travel along the carrier cable. This cable may be made of ¼ inch galvanized steel stock, such as is sold for wash line purposes, and it can be anchored on either end by means of large screw-eyes, thoroly secured in walls or posts, and placing a turnbuckle at one end of the cable so that it can be tightened up as required. The driving cord which pulls the target carried back and forth may be a piece of ¼ inch rope, and by utilizing special wide-grooved pulleys on the motors, the hauling rope can be given a turn or two about the pulley, so as to have a much better frictional contact with it.

Two different ways of starting, stopping and reversing electric motors suitable for controlling the target carrier are shown herewith. Any electrician can hook up these motors, and in fact anyone a little handy in electricity and mechanics can rig up the switching scheme whereby the motors are controlled. The principle of reversing small motors may be stated as follows: For small series-wound D.C. motors, the stationary or field coil terminals must be reversed to change the direction of rotation. However, either field or armature connections may be reversed for shunt-wound D.C. motors, while for the usual type of self-starting single phase A.C. motors, it is necessary in order to reverse the direction of rotation, to reverse the connections of the starting coils, or rather the terminals going to these coils and which lead out to the terminal board of the motor.

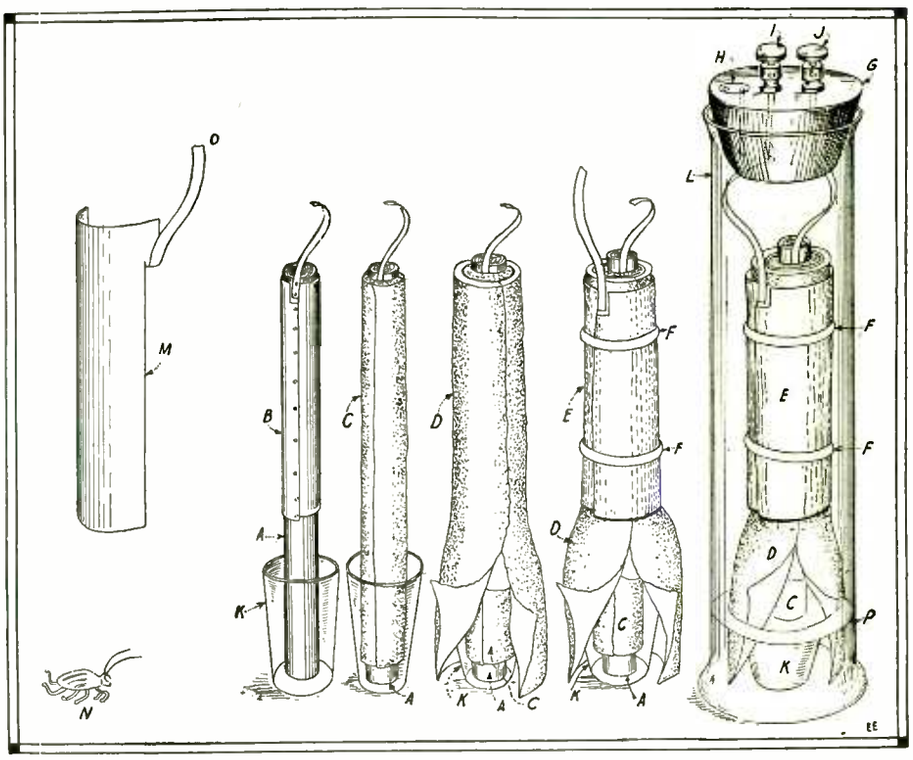
The *modus operandi* of this electric shooting gallery is carried out thusly: The marksman turns the main switch and then throws the *reversing switch* to the "in" position, if the target carrier happens to be at the rear of the range. When it approaches the forward end and the range at which it is stationed, the reversing switch is pulled out to the "neutral" position. A new target card is then inserted in the spring clip of the carrier and the old target kept for checking up the score. The reversing switch is then thrown to the "out" position, so that the motor reverses its di-

(*Continued on page 254*)

Details and General View of Electrical Target for Shooting Gallery or Home Practise Range. The Details are Simple. Its Efficacy Is Attested by the Fact that It Is in Use at a Large "Gun and Revolver Club" at Lynn, Mass.

Improved Capillary Battery

By THOMAS REED



YOU remember my *capillary battery* using two solutions, copper and zinc sulfate, which demonstrated that the solutions wouldn't mix when contained in a capillary mass like burlap, thus giving a battery of very long life on open circuit, or one of small output? The only trouble with *that* battery was its high internal resistance, and I've doped out a startling modification of it with a lower resistance, which may amount to something, provided the solutions still decline to mix under the new arrangement.

I have to postpone trying it out until I get to the "summer place" on the Cape, where my tools are; but as it's so simple perhaps some fellow "Bug" would like to make the experiment now, and beat me to it. I'll say it's worth while, for even if the cell produces but ¾ of a volt, it wouldn't take an unreasonable number of 'em to form a nice "B" battery for Audions, while they'd cost practically nothing, and if they worked at all they'd work for years.

I've drawn the thing in successive stages, to make its construction perfectly clear. You begin with a wooden dowel A, of a length proportioned to the containing bottle you're going to use. Around this you bend the very thin copper sheet B, and tack it on with copper tacks. M shows the manner of preparing this sheet, with a strip O slit nearly to the top and turned up to form a connector. K is a small whiskey-glass (anybody'll give you a whiskey-glass after July 1st) which will contain the sulfate of copper solution.

Next, you wrap the dowel—with its partial copper-coating—in the thick burlap C. I should think one layer would be enough. This goes nearly the full length of the dowel, as it is to extend down into the copper solution and draw it up by *capillarity*. At this point soak C with copper solution, so you won't have to wait for it to soak up later, also to prevent its exhausting the contents of K.

Now for another layer of burlap, D, a little longer this time, as it goes down outside of K, and dips into the sulfate of zinc (or acidulated water) solution. Nothing between these two layers of burlap; each will be saturated with its own solution and they're supposed not to mix on account of the capillary action. I have folded D back to show the interior, but the flaps will be let fall in practise. Soak D in acidulated water before putting on.

Successive Stages in Building Tom Reed's Improved Capillary Battery. It Gives Approximately Three-quarters of a Volt and Should Prove Useful in Making up "B" Batteries for Audion Circuits.

Finally comes E, a sheet of zinc, also prepared with a connecting strip. No soldering necessary, just bent around and held by the two rubber bands F F. 'Tis well to amalgamate the zinc.

Now for the bottle, L, an olive or pickle bottle with a well-fitting cork G. The zinc and copper strips are connected to the binding posts I, J. You'll also want a vent-hole H, covered with a piece of soft rubber, to release the gases without evaporating the liquids. P shows the common level of the liquids both inside and outside the cup K—saturated copper sulfate, with a few crystals added inside, and acidulated water outside.

N represents an industrious "Bug" beating me to it. Hope he doesn't return with news it's no good. We thank you for your kind attention. Refreshments, second door on the left.

That Wonderful Electric Action-Delayer

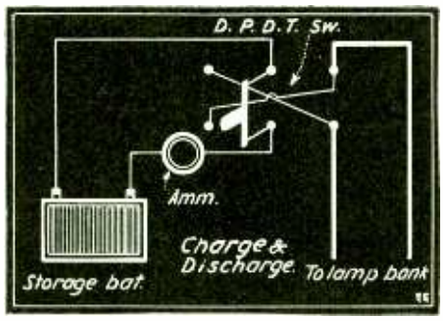
By THOMAS REED

Applying Mr. Beiler's "Thermostatic Time-Switch" or Action-Delayer to the Shopping Bag. It Opens the Purse Two Minutes After You Decide to Buy Some Worthless Junk—Giving You Time to Change Your Mind!

DID you read that article in the November number by Mr. Albert H. Beiler, describing a "thermostatic time-switch" he'd invented? Lighting a lamp, not just when you push the button, but two minutes afterward? And did you mind what he said—"If you ask me what real use it has. I can't tell you?" S-ay . . . !

If ever there was a Regular inventor—"Regular" with a Capital "R" at the beginning and a Scotch growl at the other end—it's A. H. Beiler. Invents an invention—and such an invention as THAT—and doesn't know what it's good for! Why, Al, for the love of Pete wake up and put your collar on before the cheering crowd gathers at your door! It's an epoch-maker.

There may not be any great object in delaying the action of a light, because you generally want it about the same time that you get around to pushing the button; but if you substitute for the lamp a motive apparatus, think, Man, what you've got—the greatest little second-thoughter in the world! You can have all the effect of a final decision in pushing the button, and yet have two whole minutes in which to change your mind.



I see where it's going to be applied to every door-lock right away. The Missis hears a ring, and pushes the door-button. Almost immediately she thinks, "What if it's a tramp?" She goes to the window, and sure enough there's a coat-tail sticking out from under the porch. It looks untidy, possibly ragged. Visions of robbery and murder, but—the lock has not yet operated, thanks to the beneficent Beiler. There's time to run back, press another button and cancel the order. As a matter of fact it's not a "burgular" but her brother with a nice

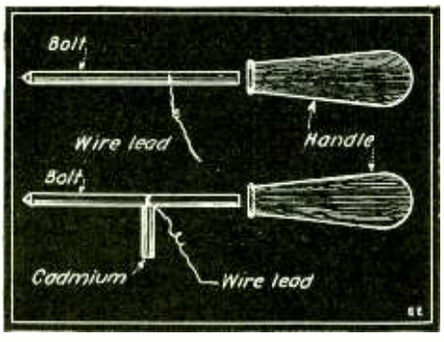
Storage Battery Testing

By Harold R. Adams
STORAGE BATTERY ENGINEER

AN outline of the methods used in commercial storage battery work, adapted to the requirements of the layman and amateur electrician is given in the following paragraphs, which may prove of assistance. The first

Handy Circuit for Charge and Discharge of Storage Battery in Testing Work. An Ammeter Should Always Be in Series With the Battery.



step is to determine the capacity of the battery under test. The capacity in ampere-hours, the charging rate at start and finish, etc., will usually be found on the name-plate of the battery.

When these have been determined the battery should be connected to a source of *direct current* and charged at the finishing rate until the cells gas freely and the E.M.F. (voltage) reads in the neighborhood of 2.5 to 2.6 volts, connected to charging current.

If the battery is of the starting or lighting type the specific gravity should read 1.285 at 70 deg. F. The *gravity* of truck batteries sometimes is a little lower than the above; however, it should be given on the name-plate or in the instruction pamphlet that is sent with the battery.

Before going any farther we will sum up the instruments needed to properly conduct the tests.

1 Hydrometer reading from 1.150 to 1.300
1 Thermometer (floating type)
1 Ammeter
1 Voltmeter (3 volt scale)
1 Lamp bank (where 110 volt direct current is used) or
1 Rheostat (where low voltage generator is available)
2 Iron bolts, 4 inches long, ¼ inch dia.
1 Cadmium rod 3 inches by ¼ inch
12 Feet stranded rubber covered cable, 14 B. & S. gage.

How the Battery Testing Prod and Cadmium Electrode Is Constructed. Brad Awls Make Good Test Prods and Cost About 10 Cents Each.

The heads should be cut from the bolts and the threaded ends inserted in wooden handles shown in figure. The cadmium rod should be soldered to one of the bolts as shown in the same drawing.

The stranded wire should be cut in half and one piece soldered to each *prod*, as shown in the illustration, the other end being connected to the voltmeter. The prod with the cadmium electrode should be connected to the positive terminal of the meter.

A very convenient hook-up is here given for charging and discharging the battery or cells. An ammeter should be in series with the battery all of the time.

When everything is ready the battery should be put on charge at the finishing rate, until the cells gas freely and the voltage reads 2.5 to 2.6 volts per cell, and the gravity of the electrolyte is correct. If the gravity of the electrolyte does not increase to the proper point after a couple of hours charging it will be necessary to add a little strong acid, great care being exercised in doing so and also in making temperature corrections in case the temperature is other than 70 deg.

The following rules governing the cadmium test should be carefully studied before going any farther if the tests are to be a success.

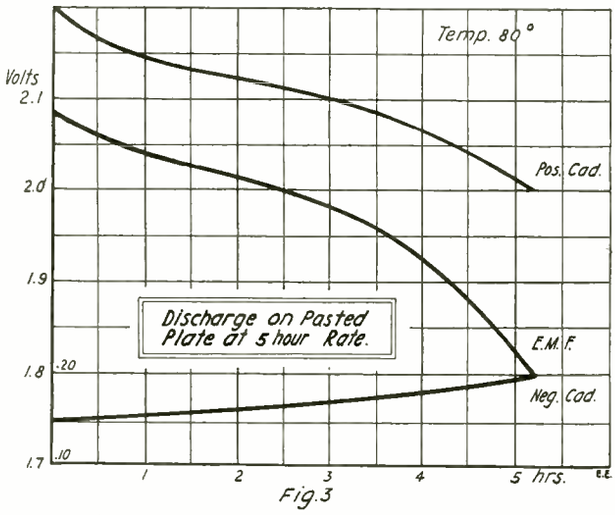


Fig. 3

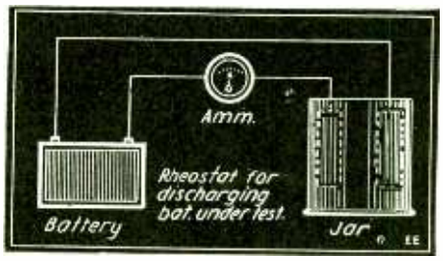
Curves Showing Cadmium Readings on Test of Pasted Plate Battery at Five-Hour Rate.

The sum of the positive and negative cadmium readings should nearly equal the voltage across the cell when the cell is charging.

The difference between the pos. and neg. cadmium readings should equal the voltage of the cell when on discharge.



The positive cadmium always reads plus.

When the cell is charging neg., cadmium reads minus.

When the cell is discharging the neg., cadmium reads plus.

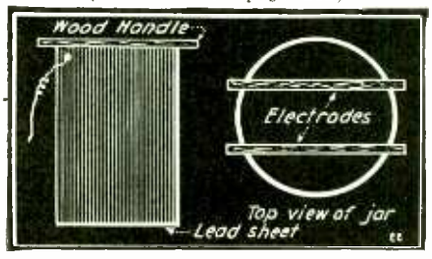
To take a cadmium reading immerse the cadmium electrode in the electrolyte and bring the other prod in contact with either the pos. or the neg. pole of the cell according to which cadmium you wish to read. When the cadmium is not in use it should be kept immersed in dilute acid (electrolyte), otherwise the readings will be incorrect.

When the cell is fully charged the E.M.F. across the cell should read from 2.5 to 2.6 volts and the pos. cad. from 2.38 to 2.44 plus. The neg.— cad. should read from —.16 to —.20 when the cell is in good condition. It has once been noticed by the author that a neg. cad. read *plus* on charge. This was found to be due to the fact that the battery had been heavily overcharged.

A Water Rheostat Proves Useful for Absorbing the Energy from Storage Battery on Discharge Test.

The plates were removed and prest, and gave very good service afterwards. The heavy overcharge had filled the pores of the plates with hydrogen which is positive to cadmium.

A slight overcharge of a couple of hours at the finishing rate about every five cycles is good for the battery, but a heavy prolonged overcharge, especially at a high temperature, will result in the ruin of the battery if allowed to occur too often.



When the battery has been fully charged and the readings recorded it should be arranged for discharge.

To discharge a battery at the standard *eight-hour rate* requires quite a little time. However, it has been noticed that when a battery is discharged at a higher rate that the *ampere-hour output is lessened a certain per cent.*, depending on the ratio of the rate of the discharge. Advantage may be taken of this fact and the following table of percentages and the time needed for the test considerably reduced. The figures in this table are taken from experiments made by the author and may be used for any make of lead plate battery, except the Edison, which is an iron-nickel element.

Table 2

Hour Rate	Pasted Plate	Plante Plate	Hour Rate	Pasted Plate	Plante Plate
8.00	100 %	100 %	1.50	53.5%	63%
7.00	96 %	99 %	1.00	46 %	55%
6.00	92 %	96.5%			
5.00	86.5%	93 %			
4.00	80 %	88 %			
3.00	72 %	80 %			
2.00	61 %	70 %

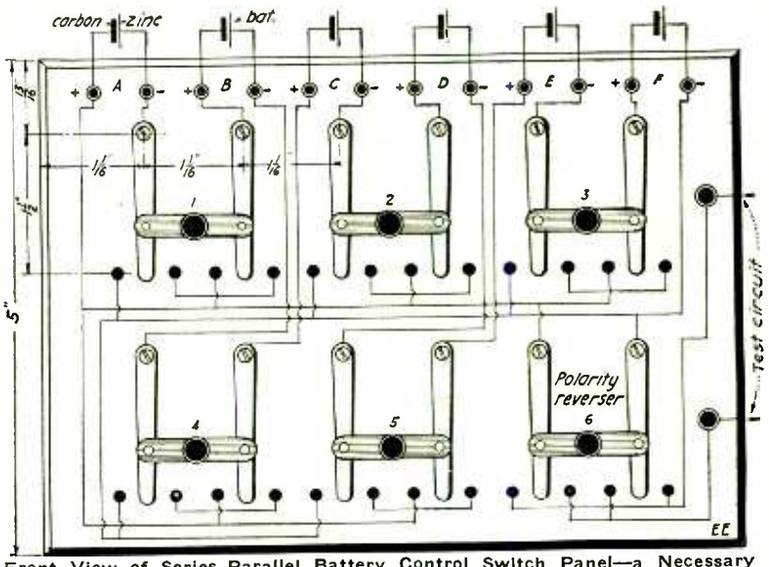
HOW TO BUILD AN ASTATIC GALVANOMETER.

By C. G. Yungblut.

THE great trouble with many "how-to-make-it" articles is that they call for tools or material which the experimenter does not possess, and generally time or pocket-book prevents him from obtaining them. But luckily in electrical construction, if one thing is lacking, another can generally be supplied that will perform the service quite as well, and the experimenter can turn out a creditable piece of work whatever his resources may be. Especially is this true in the constructing of galvanometers.

Suppose, for instance, you want a good sensitive galvanometer, and you want to make it yourself. The *D'Arsonval* type is out of the question, let us say, because you haven't the required magnets. Make an *astatic,* then. The first thing that causes trouble is a covering to protect the delicate suspension from currents of air. A clear glass cover the proper size and shape would cost a good deal. But here's an easy way out of that dilemma. Get one of those glass chimneys used on gas burners, one of the cylindrical kind, that narrows down at both ends. Procure one of good clear glass, free from bubbles and ridges, and you have an excellent cover. The next difficulty is the suspension. To be delicate, it should be high, higher than the cover itself.

Let us make a top for our cover. If you have a lathe turn one from wood or fiber that will just fit into the top of the cover,



An "Astatic Galvanometer" Is an Instrument Which Every Student Does Not Care to Purchase. Yet He Often Needs It Urgently. The Present Article Tells How to Build a Very Sensitive One of the Reflecting Mirror Type.

with a flange to keep it from slipping thru. If you have no lathe, cut out two disks of thin wood with your pen knife, or a scroll saw, one just large enough to slip into the top of the chimney and the other about three-sixteenths of an inch larger all around. Fasten the two disks together, and you have a cover as good as one turned on a lathe. Next get a large test tube, and cut off the closed end, so that a cylinder of glass with a flange at one end is left. Bore a hole in the center of the cover you have just made, slightly smaller than the internal diameter of the test tube, and fasten the tube in place over this hole. If you have made the cover of two disks, the flange of the test tube can conveniently be placed between the two before you fasten them together, as the diagram suggests. Now assemble the cover and its top with the tube in place. You can at once see that if the astatic element, M, is hung from the top of the tube, the suspension will be high enough, and will be completely protected.

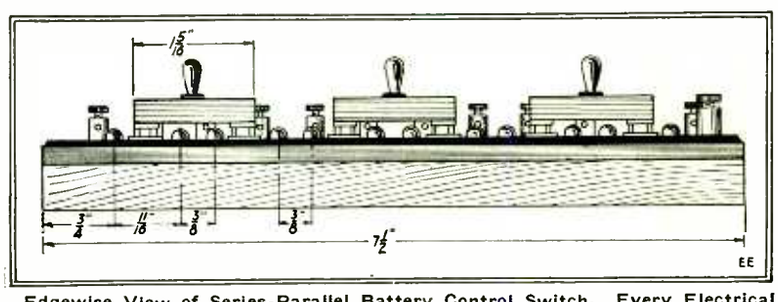
(*Continued on page 278*)

A Series-Parallel Battery Switch

A very convenient switch for quickly and easily connecting battery cells in a variety of combinations is herewith described. No machine work or intricate designing is necessary. Carefully lay out the location of the holes on the fiber base according to the diagrams. The holes on the under side of the base, which are not shown in the present illustrations, are drilled with a No. 40 drill to a depth of 3/16" with a 4/36 tap; tap one turn enough to get a screw started. Be careful not to go thru the base with the drill or tap. The continuation of these holes in the fiber strips forming the sub-base are drilled with a No. 32 drill, to allow the 4/36 screw to slip thru easily, and slightly countersunk. The size of the holes for the binding posts will depend on the size of the binding post shank. All other holes in the base are drilled with a No. 18 drill. Fasten the sub-base strips to the under side of the base with the No. 4/36 by ⅞" screws; be careful not to strip the threads. File and sandpaper the whole base to give as near as possible the appearance of a solid piece.

Front View of Series-Parallel Battery Control Switch Panel—a Necessary Adjunct to the Experimenter's Laboratory. Any Desired Grouping of the Cells—Series, Parallel or Series-Parallel—Is Possible by Its Use.

The following materials will be needed:



One fiber base, 7½" x 5" x ¼".
Two fiber strips, 7½ x ¾" x ¼".
Two fiber strips, 4½" x ¾" x ¼".
Twelve fiber strips, 1 1/16" x ¼" square.
Twelve copper strips, 1¾" x ¼" x 3/32".
Fourteen small binding posts.
Twenty-four round-head machine screws, 8-32 x ½".
Twelve round-head machine screws, 8-32 x ¾".
Twelve flat-head machine screws, 4-36 x 3/16".
Eight flat-head machine screws, 4-36 x ⅞".
Forty-eight hexagonal 8-32 nuts.
Eighty-four ⅜" dia. washers.

Next, drill a No. 18 hole ⅜" from one end of each of the copper strips; also drill a No. 32 hole 1⅜" from the same end, and countersink. The corresponding holes in the ¼" square by 1 5/16" fiber strips are drilled to a depth of 3/16" with a No. 40 drill; make these holes ⅛" from each end, and tap the turn with 4/36 tap; the screw will then go in very tightly without binding on the copper strip. Fasten these handles on the switch blades first; then put an 8/32x¾" screw thru from the top of each blade and run up a nut on the other side. Then put on a washer and insert in the proper holes in the base, and put on two washers; then fasten with one nut. For the contact-points, put an 8/32x½" screw thru each of the proper holes on the base, put on two washers underneath and then proceed to fasten with one nut.

The connections are made according to the diagram in Fig. 3. Unless all connections are soldered, the wires must be run from one contact to the other, instead of being tapt off as shown. Do not use smaller wire than No. 18 D. C. C. for this purpose. Place all ends of wires between washers, and screw nut up tightly, being careful the switches do not bind. Then coat the wires with heavy shellac or glue to hold them in place.

The cells to be operated are permanently connected to the binding posts marked by the letters "A, B, C, D, E, F" in Fig. 3; connect one cell to each pair of posts; the positive and negative polarities must alternate as indicated. The possible combinations are tabulated in Fig. 4, which should be used for reference. Switch No. 6 is first thrown to the left or right, according to the polarity desired at the test current terminals. When using the switch-board this switch must be thrown either in one position or the other. Under "CELLS" look for combination desired; under "SWITCH POSITION" find position of switches to give the combination. For example: to obtain current from 3 cells in series and 2 in parallel, look in column marked "CELLS" and in "Series" column find 3 and in "Parallel" column find 2. Under "SWITCH POSITION" in columns marked "LEFT" and "RIGHT" find "2" and "1, 3, 4, 5," respectively. Place switch No. 2 on its left-hand contacts and switches Nos. 1, 3, 4 and 5 on their right-hand contacts; the current is taken from the pair of binding posts near the right-hand edge of the base. If the polarity is to be changed, move switch No. 6 to the opposite position. The switches that are not specified in the table for any particular

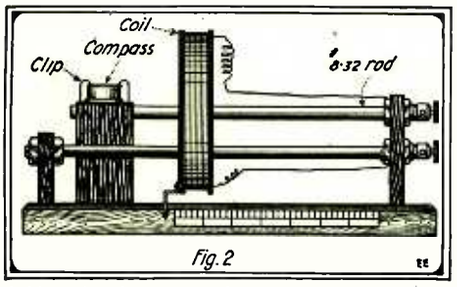
HOW-TO-MAKE-IT

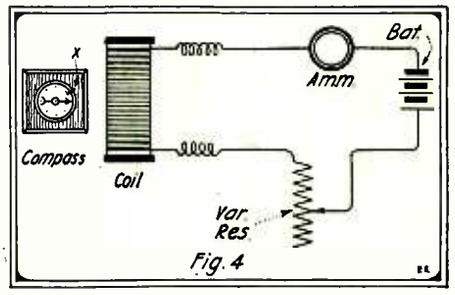
This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

A Laboratory Measuring Instrument

FIRST PRIZE, $3.00



The Magnetic Coil Used to Actuate the Calibrated Compass Is Here Shown Mounted in a Pivoted Pedestal.

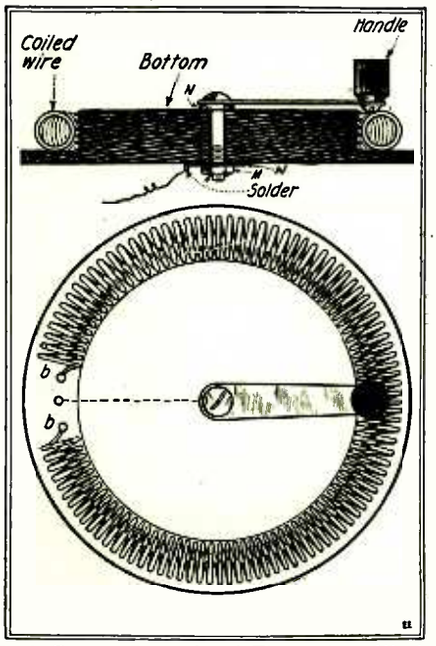


If we take a coil of wire as shown in Fig. 1 and set a compass in the center as shown, with the compass needle pointing in the plane of the coil, then when current is past thru the coil the needle will swing at right angles to the plane of the same. One objection to this type of apparatus is that it is very critical and no direct readings can be taken to scale—for this reason the following instruments if properly constructed will be of advantage to any experimenter in his laboratory. It not only being cheap in construction but it is likewise efficient when calibrated by a method given below.

In Fig. 2 one type of instrument is shown. A compass is clamped on a wooden stand by two brass clips as shown and the coil (current coil) is supported by the 8/32 rods and slides back and forth on them. A pointer is affixt to the coil and moves over the scale.

In Fig. 3 the compass is supported on a wooden stand in the same manner described above, but here the coil rotates away from the compass on a 90 degree angle (or quarter circle) decreasing its distance from the compass in that manner. Here, of course, the scale has to be affixt to the support which also holds the coil, its arm and handle.

A Very Useful Form of Home-Made Measuring Instrument. The Compass Is Affected in Proportion as the Coil Is Moved Toward or Away from It.



Hook-Up of Apparatus for Calibrating. The Current in the Coil Is Varied by a Rheostat.

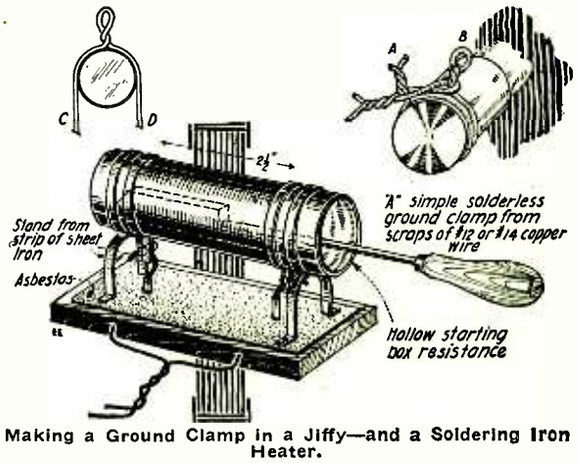
Calibration of the Instrument: As shown in Fig. 4 a standard ammeter for battery use is connected in series with the coil and the batteries, the current from the batteries is regulated by a variable resistance. A mark is made with black paint on the compass as shown at X in the drawing. This mark is employed in the following manner: The coil is moved one degree on the scale and the resistance varied until the compass deflects to the mark—this is noted on the scale—and the coil is then moved back another notch on the scale and the same procedure complied with, until finally the entire scale is plotted. This makes a very neat and efficient measuring instrument.

Contributed by E. T. JONES.

A Rheostat Push-Button

SECOND PRIZE, $2.00

Push Button Bases Lend Themselves Nicely to the Construction of Home-Made Spiral Wire Rheostats.



Remove all contacts and other trimmings from the bottom of a common wooden push-button. Then make a coil of resistance (iron, German silver, etc.) wire, put it in position shown, and fasten the ends in place by two binding posts, b and b. The contact arm is sheet brass, 1/16 inch thick. The handle is a piece of one-half inch dowel, fastened by a small round-head wood screw, which makes contact with the wire. The arm is fastened securely to the bolt by a nut, N. A washer, W, is slipt over the bolt on the back at the bottom, and then another nut, M, which is soldered to the bolt. A wire is soldered to the washer for connections. This rheostat should be used for light work only.

A "TWO SECOND" GROUND CLAMP AND SOLDERING IRON HEATER.

My "two-second" ground clamp is made from scraps of No. 12 or 14 B. & S. gage copper wire. I have used a clamp like this and find it gives entire satisfaction. The

REPAIRING TEST-TUBES.

Being short of test-tubes and unable to obtain more at the time, I chanced upon the idea of mending some of the broken ones. My first trials were unsuccessful because of the bottom being too thick. I

Don't Throw Away Your Broken Test-Tubes. You Can Repair Them Easily. Just Try!

managed to get a good, thin bottom by the following method:

The broken test-tube was lowered into the Bunsen flame and the jagged edges, when soft enough, (still held in the flame) were pulled out with the aid of an ordinary pair of pliers. When the walls seemed thin enough, the jagged ends were drawn together thereby closing the end of the tube as in Fig. 3. The heat was concentrated on "b," Fig. 3, and when soft enough the tip "a" was drawn out (*while held in the flame*). The result appears at Fig. 4. Still holding the tube in the flame, the bottom was heated until soft when it was quickly removed, the open end placed to the mouth, and the breath forced into it. This was done several times until the bottom assumed the shape of that at Fig. 2. Then it was annealed well in the luminous flame and set aside to cool. The result is a test-tube that may be used for all ordinary purposes not requiring heat. The tube may also be used in the flame if the tip of thick glass "d," Fig. 2, is removed with the aid of a grinding wheel or an oil-stone and the tube re-heated and annealed again.

The jaws of the pliers must be hot when it comes in contact with the hot glass and preferably one with narrow jaws and insulated handles. Before introducing the broken test-tube in the flame it must be well heated in the air above the flame to prevent further cracking.

SOLUBILITY OF GAS PRODUCES FASCINATING EFFECTS.

A very interesting chemical experiment can be performed with the apparatus shown in the illustration. A perfectly dry Florence flask is used for the upper vessel. It is filled with hydrogen chlorid gas, which is prepared by heating a mixture of moistened common salt (sodium chlorid) and sulfuric acid. The gas is collected by downward displacement as it is heavier than air.

This flask is connected by means of a glass tube to a similar vessel, which is nearly filled with a blue litmus solution. This solution is made by dissolving a very small quantity of the blue litmus dye in water. The end of the tube, opening into the upper flask is drawn out, so as to make a rather fine jet. All the stoppers are fitted tightly.

By blowing into the open tube of the lower vessel, a few drops of the liquid are forced into the upper flask. The hydrogen chlorid at once dissolves, thus diminishing the pressure inside the vessel. The blue solution then forms a fountain at the jet and continues to do so, until almost all the chlorid is used up. This gas has also the property of changing blue litmus to red, hence as soon as the solution comes in contact with it, the color is changed immediately, thus presenting a very mysterious appearance to a novice.

DROPPER FROM OLD LAMP BULBS.

I have found a very good use to which old worn out electric bulbs can be put. First, the solder is melted from end of the base and the small disc is removed. Now, by using a little pressure, the entire base may be removed. Then, with a piece of heavy wire or a nail, the glass post on which the tungsten filament is attached, can be broken. The glass pieces and tungsten wire must then be removed. Care should be taken to keep the opening at the bottom as small as possible. If the bulb is now filled with water and quickly inverted, the water will not flow out but by slightly tilting it, the water will come out drop by drop. This makes a very good dropper for use in chemical experiments. If a rubber tube is attached as in Fig. 2 the dropper may be used on any receptacle.

Electrical Oscillators

By NIKOLA TESLA

MR. TESLA makes a very important contribution to the electrical arts with this article.

The pioneer of all high frequency apparatus divulges much that is new and startling in these pages. Few people realize the enormous value of Mr. Tesla's machines and the many different important uses to which they can be applied in our everyday lives. New and startling uses are being found every year for these machines.

It is characteristic of Mr. Tesla that he has developed and actually built an astounding variation of these machines, and we regret that we can publish only a very few of the more important models.

Most of the Tesla coils shown have never been publisht before. —EDITOR.

FEW fields have been opened up the exploration of which has proved as fruitful as that of high frequency currents. Their singular properties and the spectacular character of the phenomena they presented immediately commanded universal attention. Scientific

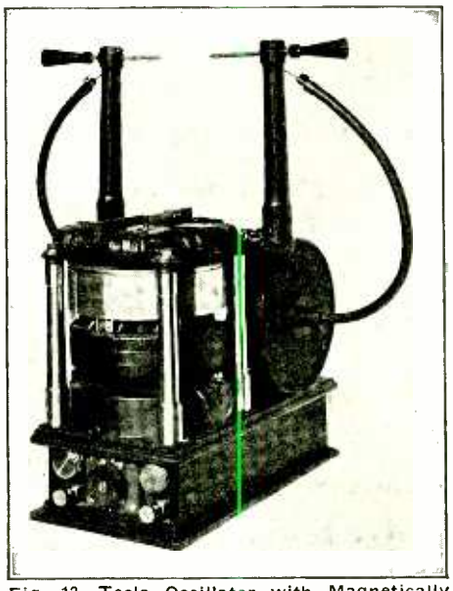

Fig. 13—Tesla Oscillator with Magnetically Controlled, Sealed Mercury Interrupter.

men became interested in their investigation, engineers were attracted by their commercial possibilities, and physicians recognized in them a long-sought means for effective treatment of bodily ills. Since the publication of my first researches in 1891, hundreds of volumes have been written on the subject and many invaluable results obtained thru the medium of this new agency. Yet, the art is only in its infancy and the future has incomparably bigger things in store.

From the very beginning I felt the necessity of producing efficient apparatus to meet a rapidly growing demand and during the eight years succeeding my original announcements I developed not less than fifty types of these transformers or electrical oscillators, each complete in every detail and refined to such a degree that I could not materially improve any one of them today. Had I been guided by practical considerations I might have built up an immense and profitable business, incidentally rendering important services to the world. But the force of circumstances and the ever enlarging vista of greater achievements turned my efforts in other directions. And so it comes that instruments will shortly be placed on the market which, oddly enough, were perfected twenty years ago!

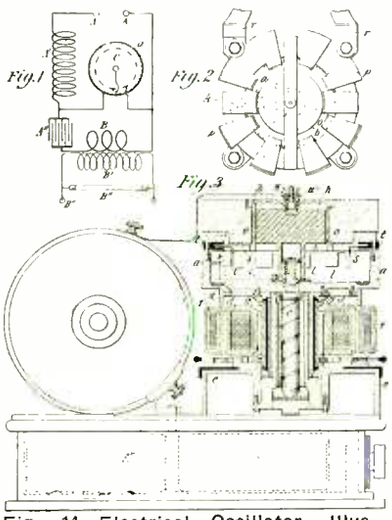

Fig. 14—Electrical Oscillator, Illustrated in Fig. 13, Showing Details and Circuit Connections.

These oscillators are expressly intended to operate on direct and alternating lighting circuits and to generate damped and undamped oscillations or currents of any frequency, volume and tension within the widest limits. They are compact, self-contained, require no care for long periods of time and will be found very convenient and useful for various purposes as, wireless telegraphy and telephony; conversion of electrical energy; formation of chemical compounds thru fusion and combination; synthesis of gases; manufacture of ozone; lighting; welding; municipal, hospital, and domestic sanitation and sterilization, and numerous other applications in scientific laboratories and industrial institutions. While these transformers have never been described before, the general principles underlying them were fully set forth in my publisht articles and patents, more particularly those of September 22, 1896, and it is thought, therefore, that the appended photographs of a few types, together with a short explanation, will convey all the information that may be desired.

The essential parts of such an oscillator are: a condenser, a self-induction coil for

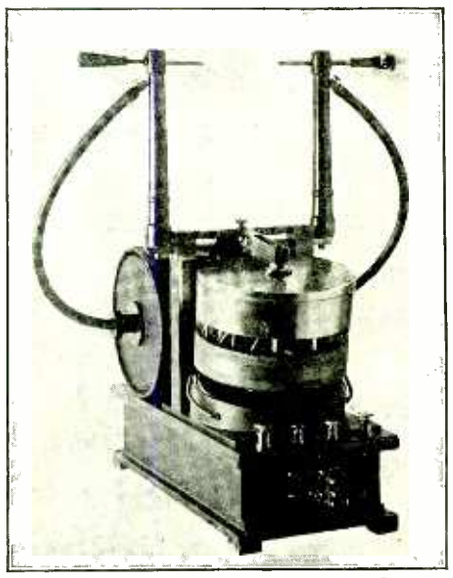

Fig. 15—Tesla Transformer with Gravity Controlled, Sealed Mercury Interrupter.

charging the same to a high potential, a circuit controller, and a transformer which is energized by the oscillatory discharges of the condenser. There are at least three, but usually four, five or six, circuits in tune and the regulation is effected in several ways, most frequently merely by means of an adjusting screw. Under favorable conditions an efficiency as high as 85% is attainable, that is to say, that percentage of the energy supplied can be recovered in the secondary of the transformer. While the chief virtue of this kind of apparatus is obviously due to the wonderful powers of the condenser, special qualities result from concatenation of circuits under observance of accurate harmonic relations, and minimization of frictional and other losses which has been one of the principal objects of the design.

(*Continued on page 259*)

SPECIAL NOTICE

Last month we announced another special feature article by Mr. Tesla, which altho made in good faith by us was not authorized by him. Due to very important duties of Mr. Tesla, it was impossible for him to furnish his historical article this month, so the special feature article publisht on this page takes its place. An important historical article will appear in the August issue.—Editor.

RADIO DEPARTMENT

New 1 K.W. Panel Radio Transmitter

By LESTER F. RYAN

THE great war has wrought tremendous changes in the design of radio apparatus. Among these designs is the 1 K.W. panel transmitting set used by the U. S. Navy on a great many of their vessels during the war, and in use at the present time on a great many of the U. S. Shipping Board vessels.

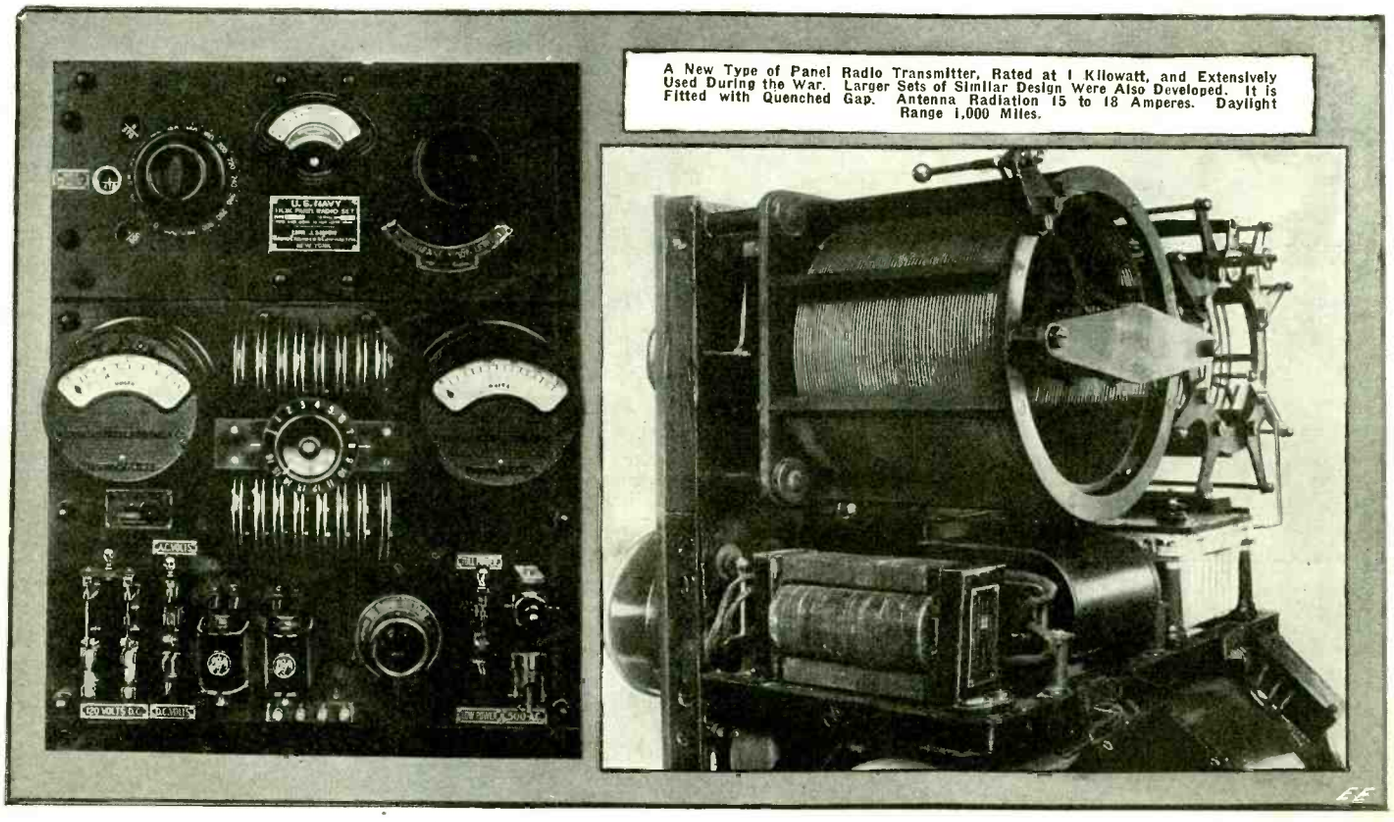
The 1 K.W. set is one of the most efficient sets in use, being constructed for both efficiency and durability. The panel consists of two bakelite-dilecto pieces mounted vertically, the top panel carrying the hot-wire ammeter as well as the unique-wave changing devices.

The lower panel consists of the A.C.-D.C. voltmeter, wattmeter, the latest design of quenched gap, also the control switches. The panel is 0.5 inch thick. Back of this is the framework upon which the panels are securely fastened. At the bottom is a tray constructed of rigid iron cross-pieces upon which the motor-generator is securely bolted. The motor-generator is driven counter-clockwise from the motor end by D.C., at 120 volts, and is rated 2.1 H.P. at the motor. The generator is rated at 1.25 KVA, or 1000 watts at 80 per cent. power factor. It is of the inductor type, and has 15 poles, and is a 500 cycle machine.

The motor-field strength is controlled by an 18-point rheostat, which varies the frequency between wide limits. The D.C. service switch is rated at 20 amperes, 250 volts.

The automatic starter consists of five distinct parts, two solenoids and two contact discs which are carried by plungers working in the solenoids, also a common resistance box. The right-hand solenoid has two separate windings, the first being a *current* winding in series with the motor-generator and starting resistance. The left-hand solenoid has this type of winding solely. The extra winding on the right-hand solenoid is connected across the service line as shown in diagram. This is termed the *potential* winding. The generator field rheostat is a single plate of the iron-clad type, 6 inches in diameter, giving a total resistance of 300 ohms. The control of the rheostat is effected by a handle which is operated from the front of the panel.

The meters are of the Weston type, the A.C. and D.C. voltmeter being of the double-scale design. The resonance inductance which is furnished with this set is of the iron-clad type. It has two windings, one being for full power operation, the second, which is larger inductance, is for low-power operation. Actual operating tests show that the natural period of the A.C. armature, resonance, inductance and transformer primary is 425 cycles. The operating frequency ranges from 450 to 550 cycles.



One of the most unique parts of this set is the combination flame-proof Morse key and antenna switch. The key is made with large contacts for carrying audio-frequency currents at low potential. It is encased in a gas-tight housing of black Japanned sheet brass, this housing making the "live" parts of the key free from all electrical contact with the power circuit. The connection between the key and the panel is made by two lengths of flexible cable, each five feet long. By means of the antenna switch, both the generator armature circuit and also the generator field circuit are broken when the switch is in receiving position.

The transformer used in connection with this set is of the closed-core, dry type, and is rated at 1000 watts, 500 cycles and 150 volts at the primary winding terminals. The ratio of transformation is 38 to 1. The transformer is insulated for dielectric stresses of 30,000 volts. The protective gap consists of three balls in shunt with the secondary, forming an inverted triangle, the lower ball being grounded to the frame of the transformer. They are set to stand a potential of 50 per cent above the maximum secondary voltage. The losses in this transformer due to hysteresis and eddy currents are less than 50 watts at full rated load.

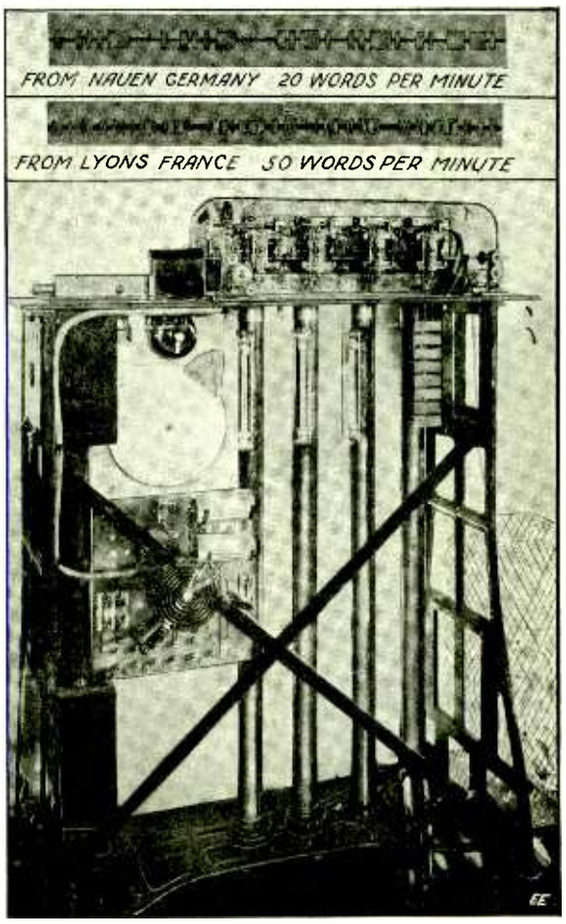
The two condensers used are of the Dubilier type of .004 M.F. capacity, and connected in parallel. These condensers are made of select mica, and were tested to show minimum dielectric resistance and hysteresis. Each condenser is mounted in an aluminum housing. This is to insure durability.

The quenched-spark-gap switch is one of the most efficient yet developed. It is in

(*Continued on page* 254)

A New Type of Panel Radio Transmitter, Rated at 1 Kilowatt, and Extensively Used During the War. Larger Sets of Similar Design Were Also Developed. It is Fitted with Quenched Gap. Antenna Radiation 15 to 18 Amperes. Daylight Range 1,000 Miles.

How European Radio "Sigs" are Photographed Here



Messages Can Be Taken at 600 Words Per Minute. Deaf Persons Can Receive Them

PHOTOGRAPHIC receiving and recording of wireless messages as a matter of regular daily routine is now being carried on by naval engineers at the Otter Cliffs receiving station near Bar Harbor, Maine. They use an instrument invented by C. A. Hoxie.

The use of this invention permits the eye to either supplement or replace the ear in reading wireless messages. In fact, a totally deaf man could be a wireless receiving operator in a station so equipt.

It is stated that messages have been deciphered with its assistance, when operators were unable to get a single word of it by ear alone. From now on receivers do not hear by their ears alone.

Thus the outstanding obstacles to accuracy in wireless receiving have been eliminated, except for severe static interference.

Visual Radio Receiving Device. Tape Starts at Extreme Right and After Being Exposed to Flashes Corresponding to the Wireless Dots and Dashes, is Developed and Dried in the Four Tubes in Center, and Then Runs Off End at Extreme Left Into Basket, the Same as a Broker's Ticker Tape. The Upper Tape is a Reproduction of a Message Sent from Nauen, Germany, to Bar Harbor, Maine, at the Rate of 20 Words a Minute. The Lower Tape is that of a Message Sent from Lyons, France, to Bar Harbor at the Rate of 50 Words a Minute.

Receiving 600 Words a Minute.

As to speed in receiving, this machine has frequently recorded at the rate of 400 words per minute, as fast as a machine gun shoots, and recently in a test made by Mr. Hoxie, the machine recorded a low power message at 600 *words a minute!* Up to this time the most rapid method of recording radio signals has been by the phonograph, but this must still be transcribed by the ear and not the eye. Moreover, no permanent visual record is made. The phonographic method has never yet approached the rate of 600 words per minute, so the new instrument has hung up a new speed record. An interesting sidelight on this feature of the invention is that high speed messages are *secret messages* to all who are not equipt with this device.

A commercial phase of the speed question is peculiarly linked up with the atmospheric-electric phenomena of the northern temperature zone. For years it has been found that the best time for transmitting all wireless messages between here and Europe was from 4 A. M. to 10 A. M. Speedy sending and receiving can condense the traffic into this most favorable period, or a greater volume can be sent with a minimum number of stations. When it is remembered that a pair of stations—one in Europe and one here—can easily cost $2,000,000—the item of keeping down overhead charges by rapid sending will be easily appreciated.

Expert operators have been known to receive 35 words per minute for a short time under perfect conditions, but average reception up to this time has been 15 to 20 words per minute—or 1,000 words per hour.

It has been a race between sending and receiving speeds. Prior to this invention it has been possible to send the message faster than it could be received, but now the situation has been reversed.

The photographic recorder has been in daily operation at Bar Harbor, Maine. It has repeatedly recorded regular traffic schedules ranging from 1,000 to 7,000 words without interruption; and at a speed of 40 to 55 words per minute every word is perfect and easily and quickly read. It is used supplementary to the ordinary type of receiving set.

Not only is the message permanently recorded on a tape of special photographic paper, but a fleeting visual image of the signals can be seen on the ground glass of the machine at the same instant that the electric impulses arrive from the antenna.

And even more than this—an audible reception can also be made simultaneously by the regular telephone method.

How the Recorder Works.

The mechanism is based on a comparatively simple electrical engineering principle. A light-weight mirror "flutters" in electromagnetic tune with the minute electric impulses coming from the receiving antenna. The duration and extent of the mirror's oscillations vary according to the dot, dash or silence of the sending station. This mirror reflects a beam of light on the moving sensitized tape. This tape, propelled by an electric motor, progresses up and down thru the vertical pipes which contain the developing and fixing chemicals.

Automatically the tape enters the developing fluid and then the hypo fixing bath; then it is washed in running water, and is dried by electric heat assisted by forced draft—all invisibly effected inside this single machine. Like the tape from a stock-ticker, the message pours out of the wonderful device and into a basket. In rapid receiving there is an average of *one word for every inch of tape.* The receiving operators can read the record at a speed of 50 to 100 words per minute.

The time to record, develop, fix, wash and dry the tape is from *two to four minutes.* The rolls of tape are 1,000 feet long and a continuous message of 10,000 words can be recorded without reloading the machine.

A remarkable performance of this machine only recently promises great things. As told by Mr. Hoxie:

All On One Aërial.

"Two simultaneous messages from different sources were coming in to one receiving circuit connected to the new photographic recorder. One of these messages was sent at a train frequency of 1,000 cycles per second, and the other at 975 cycles per second. Ordinarily two frequencies so close to each other would have interfered with reception, and I was pleased that I could receive one of the messages. But by a slight adjustment of the machine I was able to receive the other message; then back to the first; then switched off to the second—receiving either message without interference from the other.

"I hope to perfect the instrument so that in the not far distant future several photographic recorders can be attached to a single antenna and simultaneously receive messages from Rome, Lyons, Carnarvon, Wales, Nauen, Germany, and San Francisco! This may be called simultaneous multiplex receiving from one antenna.

"When this is accomplished, an international receiving station would have but a single antenna; and in a room inside the station there would be a row of machines with tapes pouring into baskets. One could pause at the first basket and read of the new president of Germany; stepping to the next basket he would read of a volcanic eruption in the Philippines, and only a few feet further on will be the baskets marked 'London,' 'Paris,' 'Rome,' 'San Francisco,' 'Sydney' and 'Shanghai.'!"

It has long been the dream of radio engineers to realize a perfected device for recording accurately wireless signals.

The Pliotron Oscillator

By WILLIAM C. WHITE

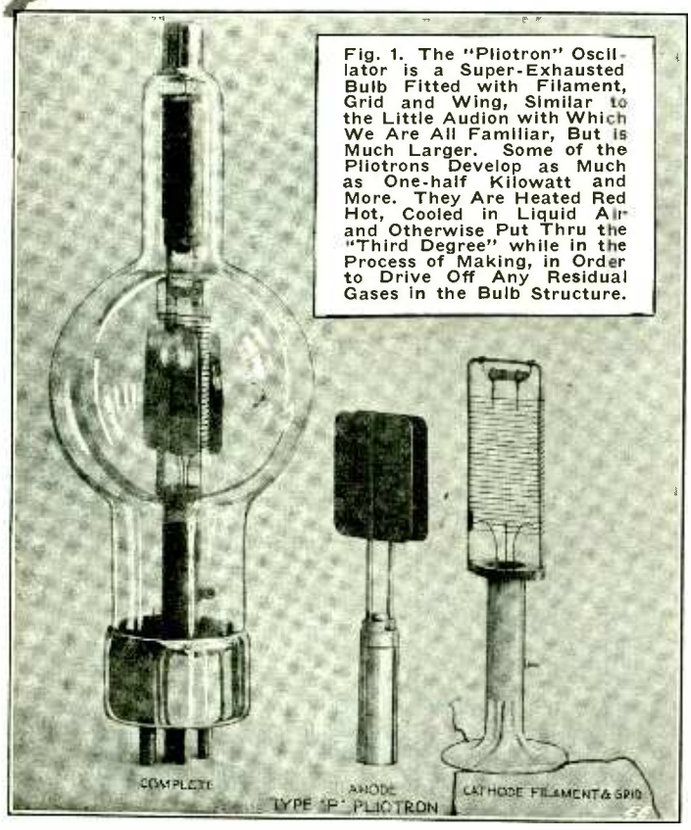

Fig. 1. The "Pliotron" Oscillator is a Super-Exhausted Bulb Fitted with Filament, Grid and Wing, Similar to the Little Audion with Which We Are All Familiar, But is Much Larger. Some of the Pliotrons Develop as Much as One-half Kilowatt and More. They Are Heated Red Hot, Cooled in Liquid Air and Otherwise Put Thru the "Third Degree" while in the Process of Making, in Order to Drive Off Any Residual Gases in the Bulb Structure.

THE *pliotron* vacuum tube when used as an oscillator for the production of alternating current from a direct-current source of energy, has the characteristics of an amplifying relay. That is, the wave shape of any variable electromotive force applied between the electron emitting cathode and the grid (or controlling member) will be faithfully reproduced by the currents in the main anode to cathode circuit.

Therefore, the input of a small amount of alternating-current energy will set up a relatively larger amount, identical in frequency and wave shape. Now by utilizing a small proportion of the alternating-current energy thus produced to feed back to the input circuit, the system can be made self-exciting. Alternating-current energy can thus be obtained from a direct-current source, the pliotron and its auxiliary apparatus forming a type of converter.

The type of pliotron utilized in the arrangements to be described is shown in Fig. 1, and is of the same design as used for the circuits referred to in previous articles.

In this article, two pliotron oscillator arrangements for high-frequency will be described, the first for the production of relatively large current and the second for the production of relatively high voltage. In each case the amount of energy involved is comparatively small, of the order of 150 watts or less.

In a resonance circuit the current will rise until the losses become equal to the input energy. With practical circuits the lower limit of power-factor obtainable is about one-half of 1 per cent., unless unusual precautions are taken. This means that the maximum resonance current produced is about two hundred times the value of the true energy current fed into the resonance circuit.

Therefore, where large currents are desired from a small quantity of energy, the total volt-amperes of the circuit must be kept small; and this condition requires that for such a resonance circuit a large capacity and small inductance must be used.

There is another principle which must be kept in mind. If the amount of electrical energy which can be furnished by a certain source is limited by the definite amount of primary power available, or by the losses in transmission, it is important to so adjust the resistance of the load to the voltage of the supply that the energy is most economically utilized. In the present case this means that the resistance of the heavy current circuit must be given the apparent value most suitable for insertion in the pliotron circuit. This adjustment of apparent resistance is accomplished by electro-magnetic coupling or transformer action.

The diagram of an arrangement to produce currents of from 10 to 25 amperes from one pliotron tube at frequencies between 100,000 cycles and 1,000,000 cycles is shown in Fig. 2.

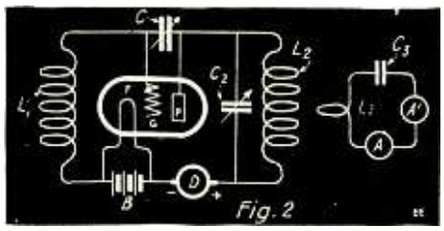

Diagram Showing Arrangement of Circuits to Produce Currents of from 10 to 25 Amperes from One Pliotron Tube at Frequencies Between 100,000 Cycles and 1,000,000 Cycles. Energy Amounts to About 150 Watts.

Suppose it is desired to calibrate a hot-wire ammeter by means of direct comparison with a standard. These two ammeters are represented by A and A_1 and are connected in series as part of a resonant circuit, the inductance and capacity of which are shown at L_3 and C_3 respectively. The product of the values of L_3 and C_3 to be used for any particular case is found by the usual resonance formula:

$$f = \frac{1}{2\pi\sqrt{LC}}$$

As mentioned in a previous paragraph, a low power-factor and volt-ampere product is desirable; and therefore the inductance value of L_3 is made the minimum possible, consisting usually of only one or two turns of heavy conductor. With the range of frequencies specified, this gives values for C_3 of the order of about 0.1 microfarad. In this heavy-current circuit it is of course very necessary to use condensers of low energy loss and to reduce the ohmic resistance of the conductors to a minimum.

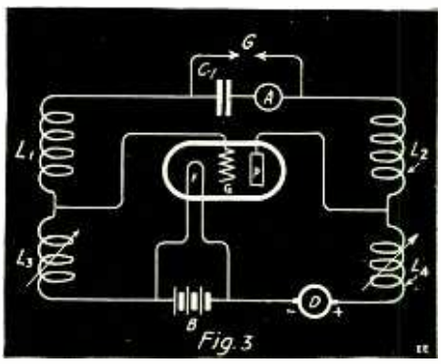
The inductance L_3 obtains energy by electromagnetic coupling from the coil L_2 which is located in the plate circuit of the pliotron.

By means of an adjustment of the values of L_1, L_2, and C_1, the pliotron system can be made to set up a high-frequency current corresponding in period to the tuned heavy-current circuit.

Owing to the relative values of L_2 and L_3, the apparent resistance in the plate circuit of the heavy-current load circuit is greatly multiplied, but still is not of a sufficiently high value to absorb all the available energy. To further increase this apparent resistance, a variable capacity C_2 is shunted about the inductance L_2. Then, by simultaneous variation of these two factors, the apparent resistance of the load can be adjusted to give the largest energy output available.

The heavy-current output is dependent upon the voltage of the direct-current source D, a useful range being between 200 and 750 volts.

Pliotrons may be operated in parallel to produce a load current larger than that obtainable from one tube.



For the production of *high-voltage* in a resonance circuit, the conditions are almost a reverse of those in a heavy-current circuit; that is, with a fixt value of inductance and capacity to give the desired frequency, the capacity must be small and the inductance large, relatively speaking. There is a practical limit, however, to this increasing of inductance and lowering of capacity; and it is reached when the distributed capacity effect in the inductance becomes comparable to the capacity of the condenser used for resonance.

A pliotron oscillator arrangement for the production of high voltages is shown in Fig. 3. The high voltage is obtained across the condenser C_1, and may be tested by the gap G. A condenser in the form of two metal plates suspended in air* is the most convenient, and it may have a capacity value between 20 and 200 microfarads for a frequency of 100,000 cycles. By means of a hot-wire ammeter A in circuit with the condenser and by knowing the frequency, the voltage produced across C_1 may be simply calculated.

The inductances L_1 and L_2 are similar and each has a value of about 8 millihenries. The inductances L_3 and L_4 are also similar to one another and each has a

* Two metal plates, each 10 in. by 10 in. and spaced ½ inch apart, give a condenser having a capacity of approximately 40 micro-microfarads.

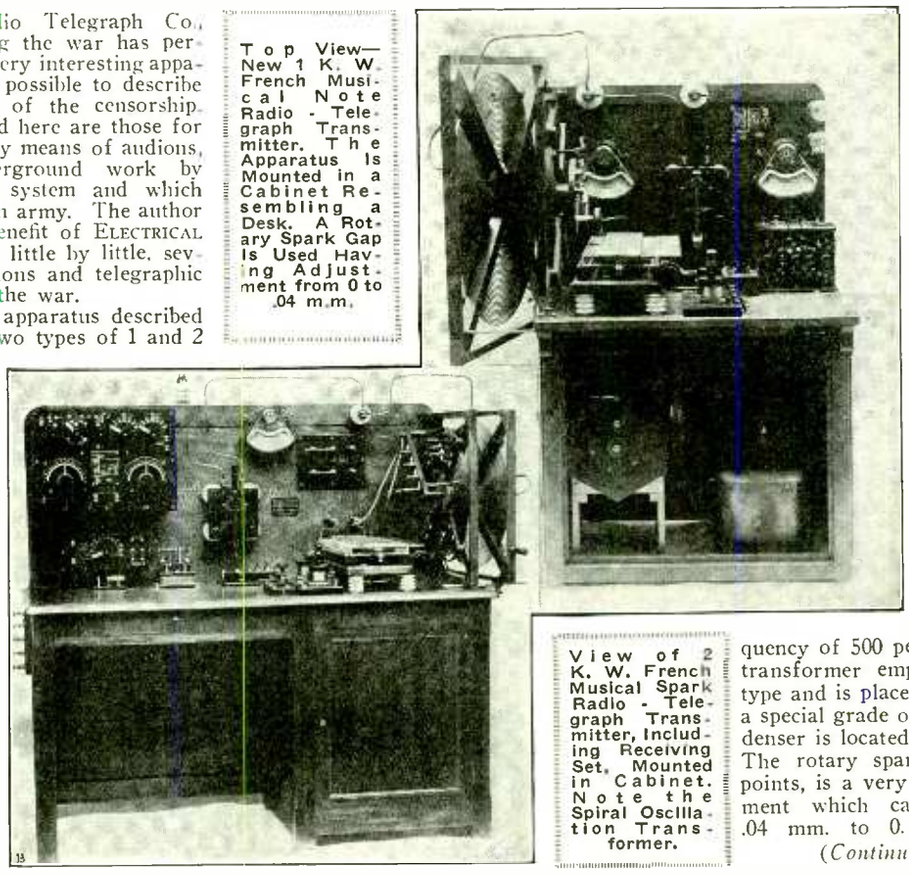
Pliotron Oscillator Arrangement for the Production of High Voltages. The High Potential is Obtained Across the Condenser C1, and May be Tested by the Spark Gap G.



Musical Radio-Telegraphic Sets

By Jacques Boyer

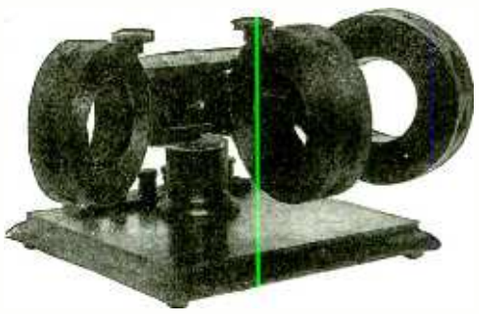
Paris Correspondent, ELECTRICAL EXPERIMENTER

THE French Radio Telegraph Co., "C. G. R.," during the war has perfected a series of very interesting apparatus which it was not possible to describe heretofore on account of the censorship. The apparatus described here are those for sending and receiving by means of audions, particularly for underground work by means of the Rogers system and which were used by the French army. The author will describe for the benefit of ELECTRICAL EXPERIMENTER readers, little by little, several remarkable inventions and telegraphic apparatus used during the war.

The musical sending apparatus described this month comprises two types of 1 and 2 K. W. capacity. The 1 K. W. set here described was used a good deal by the French submarine chasers, and proved highly efficacious. The antenna is energized by shock excitation. The principal property of this excitation is that the antenna gives out a unique wave, its length and amortization (dying out period) being independent of the excited circuits. The musical emission which gives rise to a very high tone is obtained by charging the condenser from a "shock circuit," using alternating current of a frequency of 500 periods per second. This spark frequency of 1000 periods per second produces a very high musical tone at the receiving end.

Top View—New 1 K. W. French Musical Note Radio - Telegraph Transmitter. The Apparatus Is Mounted in a Cabinet Resembling a Desk. A Rotary Spark Gap Is Used Having Adjustment from 0 to .04 m.m.

View of 2 K. W. French Musical Spark Radio - Telegraph Transmitter, Including Receiving Set, Mounted in Cabinet. Note the Spiral Oscillation Transformer.



The sending machinery comprises a monophase alternator of 1,820 volt-amperes under an intensity of 7½ amperes, coupled directly with the direct current machine. The inductor of the alternator is fed by a little excitation dynamo which is built right into the alternator. The usual switchboard arrangement is shown in our illustration.

The normal speed of the group is 3,000 revolutions per minute, which gives to the alternator a frequency of 500 periods per second. The transformer employed is of the usual type and is placed in a vessel containing a special grade of oil. The sending condenser is located in a bath of petroleum. The rotary spark gap, which has ten points, is a very accurately built instrument which can be regulated from .04 mm. to 0. Regulation is made

New Honeycomb Inductance

Now that amateur wireless is fast getting back onto a pre-war basis, some very interesting new apparatus is being brought out. Of particular interest to the amateur is a new type of inductance coil developed by Mr. R. F. Gowan, of New York City. It has been well named the "Honeycomb Coil," as can be seen by the illustration.

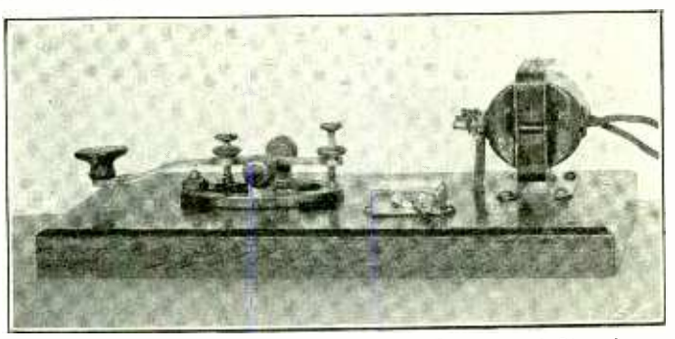
The Latest Thing in Radio Coils—the "Honeycomb" Inductance. Maximum Inductance, Banked Winding, and Nil Distributed Capacity.

This new coil winding was designed to reduce *distributed capacity* to a minimum and at the same time to concentrate a winding with a large value of inductance, in as small a space as is practicable.

A great amount of research work was done on these coils to determine the most efficient size and spacing of the wire, capacity of the windings, etc. The distributed capacity has been reduced to a minimum and to as low a value as practicable.

By actual measurements it was determined that the high frequency resistance of these coils was only 20 to 28 per cent greater than the D. C. resistance against the usual 100 per cent of the average inductance coil. The coils are remarkably small compared to their inductance values. For instance, a coil one inch wide and about four inches in diameter has a wave length of over 15,000 meters when shunted by a capacity of less than .001 mfd.

Various mountings are furnished for these coils. When properly mounted as a coupler, they make an instrument which cannot be surpast in efficiency and selectivity. Dead end or open winding absorption losses are entirely done away with.



The three coil mounting is shown in the photograph. Here the three coils are used as primary, secondary and tickler. The writer had the pleasure of listening in on a set using this combination with a variable condenser of .001 mfd. maximum capacity in the primary and secondary circuits. The antenna used was a single wire with a natural period of 185 meters. All types of signals from the lowest wave spark set to the extremely long wave undamped stations were received. The sharpness of tuning and amount of regeneration possible on all wave lengths was remarkable. This form of coil is being adopted for many commercial radio outfits, owing to its great space economy.—*Photo Courtesy De Forest R. T. & T. Co.*

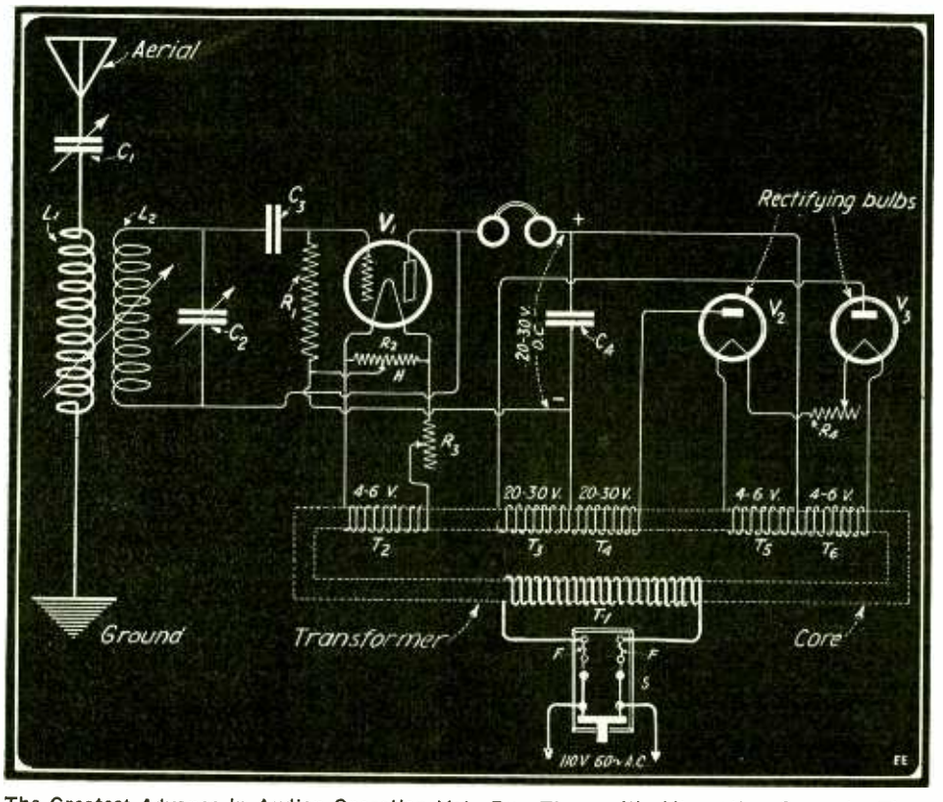
New Buzzer Set

An inexpensive outfit for buzzer practise may be easily constructed by any amateur from material obtainable from any electrical supply dealer.

The outfit illustrated is very neat and compact and consists of a bell-ringing transformer, a standard telegraph key and high-pitch buzzer, all wired and mounted on suitable base.

The use of a small transformer eliminates dry cell troubles and produces a note more nearly like that of the large stations. This form of buzzer code practise set, operated as it is from an alternating current step-down transformer, should commend it particularly to schools and colleges where the radio code is taught. For one thing, the tone of the signals given off by the buzzer is more even and regular, and thus resembles more accurately, actual commercial radio signals than is the case where batterics are employed. The operating cost is infinitesimal.—*Photo G. E. Co.*

New Code Practise Set Comprising Key, Buzzer and Step-down Alternating Current Transformer. No Batteries to Bother with and No Operating Expense.



Operate Your Audions on A. C.

By ELLIOTT A. WHITE

FORMERLY INSTRUCTOR IN RADIO, AIR SERVICE SCHOOL FOR RADIO MECHANICS, CARNEGIE INSTITUTE OF TECHNOLOGY

I OPENED my Radio Receiving Station with a sensitive regenerative receiving set using vacuum tubes, but with **no storage battery for the filaments or dry cells for the plates,** running my tubes entirely on ordinary 60-cycle **Alternating Current** tapt off the electric light fixture. The accompanying figure shows how it is done.

Altho any regenerative hook-up will serve, the one I am using with good results for receiving both damped and undamped waves has the antenna circuit C1 L1, and the secondary circuit L2 C2. The secondary circuit is connected on one side to the plate, and on the other side to the detector grid, thru a stopping condenser C3 of .00015 microfarad capacity. This is a familiar hook-up thus far. The new wrinkle is in substituting A. C. (alternating current) for the storage battery to light the filament, and *rectified* A. C. for the high voltage dry cells to operate the plate circuit.

The Greatest Advance In Audion Operation Yet—Run Them with Alternating Current. The Accompanying Text Tells How to Build the Step-down A. C. Transformer which Supplies the Proper Potential Current for the Filament and Plate. Tungar Rectifier Bulbs or Even Old Audions Serve to Rectify the A. C. for the Plate Circuit.

A transformer is necessary to furnish the low voltage for lighting the filaments of the receiving tubes, detector V1 and amplifiers (not shown), and also the filaments of the rectifier tubes V2 V3; and to furnish high voltages for the plates. The windings of the complete transformer are as follows: the primary T1 connected to the 110 v. or 220 v. A. C. lighting circuit; a secondary T2 to step this down to 4—6 volts for the detector (and amplifier) filaments; a secondary T3 T4, to give 20—30 volts from each half (or 40—60 between end terminals) for the plate; and another secondary T5 T6, to give 2—4 volts or more from each half (or 4—8 or more between end terminals) for the filaments of the rectifiers, the voltage required depending on whether they are connected in series or in parallel, as either connection is satisfactory. It is seen that windings T3 T4 and T5 T6 have taps taken off the middle, and that T3 T4 must have a total voltage *twice* that necessary for the plate.

Altho the transformer may be purchased in the form of two toy or bell-ringing transformers for the filaments and one 110—55 volt transformer for the plate (with tap in middle of 55 volt winding), all the primaries being connected in parallel, it is easy and convenient to wind a single transformer to run the whole set, as the low voltages and small currents permit the use of small wire and few turns. In a closed-core transformer the windings may easily be computed from the familiar equation $E = 4.44\ \phi\ f\ N\ 10^{-8}$ or $N = \frac{E}{4.44\ \phi\ f\ 10^{-8}}$ where E is the voltage for that particular winding, ϕ the flux per sq.in. of core which may here be put at 60,000, f the frequency, here 60, N the number of turns required per sq.in. cross section of core, and 10^{-8} is 1/100,000,000, giving $N = \frac{.625 \times E}{A}$ where A is cross sectional area of core in sq. in. In other words, to find the number of turns needed in any winding, divide the voltage of the winding by the area of cross section of the core and then multiply by .625; that is, the number of turns needed for 60-cycle current and a flux density of 60,000 lines per sq.in. is six and a quarter times the required voltage divided by the area of the core. For example, if the core is say 1 in. by 3 in. (the one I used), the area is 3 sq.in. and the number of turns is therefore approximately twice the voltage, or *half a volt to a turn.* For the winding T1, which is connected to the supply, this gives 220 turns for a 110 volt supply (or 440 turns for 220 volts); for T2, 12 turns for 6 volts, and so on. In such a transformer, small and of low power and intermittent service, it is not necessary to be exact, so long as *the ratio between turns on primary and secondaries is always the same as the ratio of their required voltages.* Any core area can easily be substituted in the formula mentioned above—$N = \frac{.625 \times E}{A}$

The size of wire depends only on the current carried. As each filament draws a little over an ampere, any size which will carry this will do for T2, unless the winding supplies amplifiers as well, in which case they must be allowed for; V2 V3 will draw about 2 amperes if in parallel or about 0.5 ampere if in series. It is therefore convenient to use ordinary No. 18 bell wire for the windings T2 T5 T6, if no larger wire is on hand. Wire as small as No. 30 cotton or enamel covered is good enough for windings T3 T4, as the amount of current is negligible, tho No. 24 cotton or enameled wire or larger is better as it is not so likely to break. As the whole transformer will draw 3—5 amperes at 4—6 volts on the low side, depending on the number of amplifiers used on the set, we can allow 35 watts as the maximum power consumption (running over 3 hours for a cent), or say 0.5 ampere on the supply side, allowing for the magnetizing current. In spite of the small current, however, it is best to use wire as large as No. 18 or No. 14 for winding T1 as well as for T2 T5 T6. My transformer, for example, is wound as follows: T1, 220 turns No. 18; T2, 12 turns No. 18; T3, 45 turns No. 24; T4, 45 turns No. 24; T5, 8 turns No. 18; T6, 8 turns No. 18 (rectifier filaments in series). Of course these details depend on the materials on hand, such as core and wire. The taps and terminals can be brought out to ten binding posts on a small board or piece of fiber clamped to the core, and the whole put inside an iron transformer case or tin cracker box to avoid "cross talk" with the set, as will be mentioned later.

The detector V1 is an ordinary 3-electrode audion receiver tube, but preferably of the new *high vacuum* type manufactured during the war, which requires no close adjustment of filament current or plate voltage but operates on 1—1.1 amperes for the filament and, for the plate, approximately 20—25 volts as *detector,* and approximately 40—45 volts as *amplifier.* If the high vacuum type is used, a grid leak R1 is required, of about 1 megohm (1,000,000 ohms) when oscillating or 2 megohms when not, if the grid circuit insulation is good. The leak may be a pencil line drawn on card or fiber and may vary considerably in resistance.

For the rectifiers V2 V3 ordinary receiving tubes may be used, again preferably *high vacuum,* with grids connected to plates; or, if obtainable, two-electrode tubes may be used, such as the Kenotron or Tungar *rectifier tubes* now available on the market. There is no reason why the experimenter may not construct them by inserting a disk in a tungsten filament light bulb and re-exhaust with a vacuum pump.

Besides the transformer and rectifier

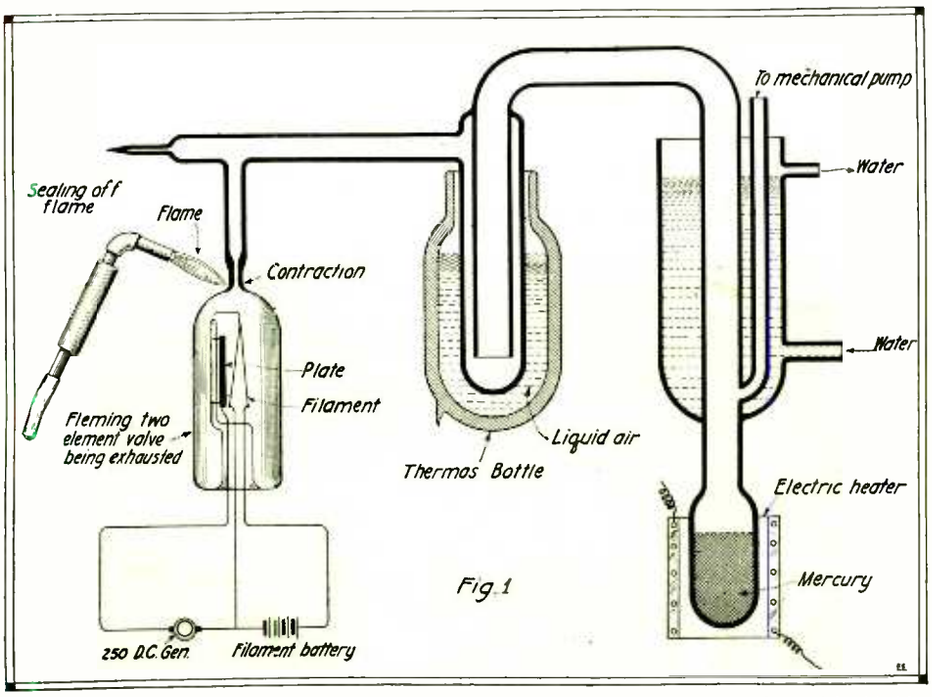
The Design, Pumping and Testing of Audion Tubes

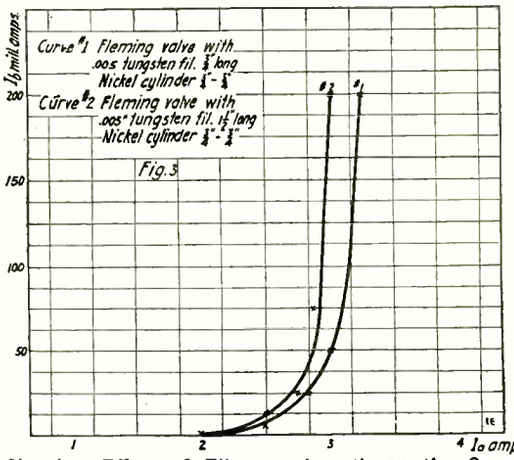
By C. MURRAY

THE purpose of this article is to bring out some of the salient points which might be of interest to the amateur radio experimenter on the design, pumping and testing of the vacuum tube detector and amplifier, or so-called *Audion*. All of these tests I have conducted in my laboratory and I have plotted curves to show the exact relations one element has to another.



The *Fleming valve* is the true rectifying detector, but Dr. de Forest, by inserting the *third element* in a vacuum tube, created a genuine relay, or energy control detector, which gives it a great many advantages over the two-electrode Fleming valve. The three-element Audion can be used as an oscillator, amplifier, and a detector of both damped and undamped waves; also it can be used as an undamped wave generator for use in either radio-telegraph or telephone transmission, whereas a two-element tube can only be used as a detector of damped waves or the ordinary spark signals.

The characteristics of a given three-element tube depend almost entirely on the grid, its surface area and its distance from the plate and filament.



The dimensions of the three elements vary according to the uses of the tube, altho all designs are interchangeable to a certain extent and will work with a fair degree of efficiency in any rôle.

There are several abbreviations that are used in the testing of vacuum tube detectors and amplifiers, and I have used some of them in plotting the present curves:—

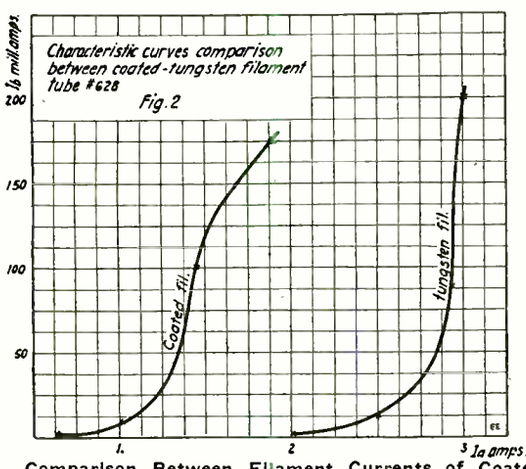
Ea = voltage across the filament.
Ia = current consumed by the filament.

Apparatus Used to Produce Super-Exhaustion in Audion Bulbs by Means of the Liquid Air Trap. This High Degree Vacuum Pump Is Backed Up by a Regular Mechanical Pump as the Diagram Shows. This Is the Regular System Used Commercially During the War in Turning Out Thousands of Audions Daily.

Showing Effect of Filament Length on the Space Current Passing Between the Plate and Filament. The Longer Filament Can Be Run at a Lower Temperature to Give the Same Results with a Longer Life.

with various chemical compounds, such as calcium oxid, barium, strontium nitrat, sulfur and lime. Many other mixtures have been experimented with, yielding good results.

The coated filament gives the best results and has one advantage over tungsten; it consumes less filament current to produce the same results, as can be seen by referring to the curves plotted for two Fleming valves, Fig. 2. Both filaments are the same length and Eb is kept at 200 volts during the test.



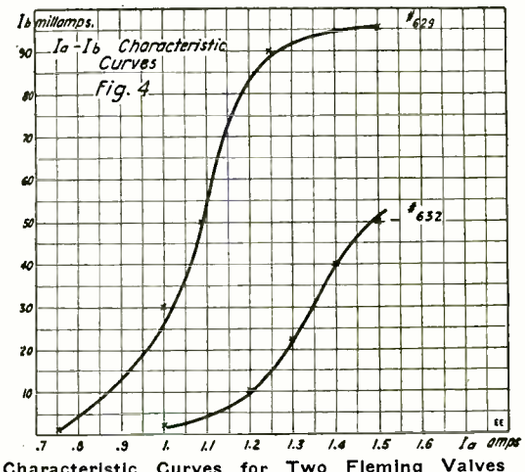
Tungsten emits very few electrons at a low temperature. The value Ib increases very rapidly as the filament temperature is raised.

The length of the filament also has some effect on Ib, as can be seen in Fig. 3. One tube has a tungsten filament ¾ inch long and the other 1½ inches long. It is seen that the longer filament can be run at a lower temperature and it will give the same results, besides giving it a longer life.

The proper length of filament to be used is determined by the voltage of the filament battery; also we must take under consideration the size of the plate, the amount of plate current to be past and its voltage.

By using too small a plate or too short a filament we will be limited in the amount of plate current we can pass, as by referring to Fig. 6 we will find a point of saturation; that is, if we raise the filament temperature still higher the valve Ib will remain at a certain point. Likewise it is true of the plate; suppose we design a tube to work at 150 volts Eb and a space current of 30 milliamperes; we can raise the Eb even to 200 and the Ib will remain the same.

(*Continued on page 264*)



Comparison Between Filament Currents of Coated and Plain Tungsten Filaments for Audions, Showing the Smaller Current Taken by the Treated Filament.

Eb = voltage imprest on the plate.
Ib = current passing between plate and filament.
Ec = voltage imprest on the grid.
Ic = current passing from the grid to the plate.
Io = current in the oscillating circuit.

The filament plays a very important rôle in vacuum tube work. It must be of such material that when heated to incandescence it will give off electrons, which form a conducting path; or, in other words, a current of electricity will pass thru the space (in one direction only) from the hot to the cold electrode.

The filaments used most extensively to-day are tungsten wire and platinum ribbon coated

Characteristic Curves for Two Fleming Valves with Different Size Cylinders. During the Tests Eb Was Kept at 200 Volts and Ia Was Varied Until a Saturation Point Was Reached.

How Don Flashed the "S. O. S."

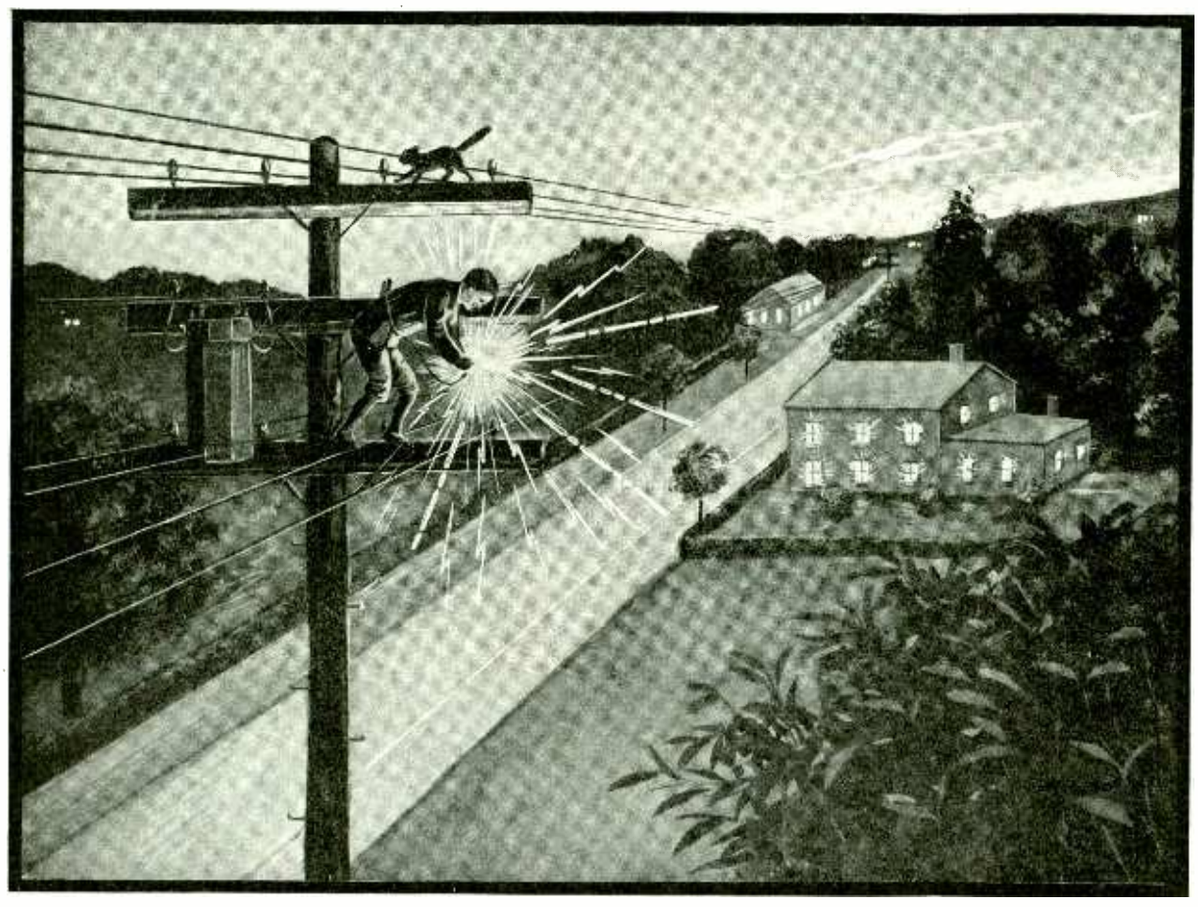
By MABEL M. DAVIS

DONALD JOHNSON'S mother says she feels sure the careless nursemaid they had when "Don" was a baby must have mixed an *electro-lytic solution* with the milk he was fed. She cannot believe that otherwise any boy could be so permeated with electricity. He could not have caught it from his family as he was an only child, and his mother could not tell a fuse-plug from a dry battery, and his father's abilities in electrical matters were all confined to paying the electric light bill on time each month.

It was different with Don's chum Will Merton. He was the youngest of a large family, all of whom were wound up and went by electricity, and that was their sole motive power.

The story of all the weird and wonderful inventions and imitations of inventions that were produced by these two boys in Don's "Lab." would fill a book. One worth while and early accomplishment was the mastery by both boys of the International Morse code and they often flashed or tapt out signals to each other from various points in the neighborhood.

One evening near dusk "Don" was hurrying home from their favorite resort, the dumping grounds of the Ajax Electrical Company's factory. He heard a faint mewing that seemed to come from overhead and looking up he finally located a cat at the very top of a nearby electric light pole. The nine-lived feline was crying pitifully and Don's sympathies were touched. Being a senior in high school, Donald was rather ashamed of showing any fondness for cats. But he glanced this way and that and not a soul was in sight. So he made a jump and a scramble, hoping to shinny up to the first spikes on the pole. He did not make it and realized for the first time how heavily he was loaded. In the pockets of his mackinaw he only had a piece of zinc rod, a large magnet for a telephone magneto, some brass rod, copper tubing, a pocketful of assorted screws, bolts, nuts, washers, another pocketful of lengths of iron core wire, and nearly a pound of miscellaneous binding posts. So he cast his treasures from him—coat and all and went to the rescue.



After a hard scramble he gained the spikes and climbed quickly up. Standing on the lowest cross-arm he tried to persuade "Pussy" to come down within reach, but she was suspicious of the proffered help and remained fast at her post. He gained the next arm and his persuasiveness brought her down a little way. He reached for her but she backed out to the end of the arm, over his head. Donald followed along to the end of his cross-arm when horrors, his foot slipt and he started to fall. Donald never could tell just how it all happened, but he suddenly found himself with his two feet on the cross-arm below and the peg of the arm above hooked thru the belt of his Norfolk coat. In falling his foot had struck the glass, broken it, released the wire, and, as his body slid by the peg it had hooked him. Luckily, his belt had held until his feet found the arm below and relieved the strain a little. He was in a very awkward and uncomfortable position. He tried cautiously to squirm about and get the belt off the hook, tho he was very much afraid that if he succeeded he might not be able to hold on to the cross-arm without the support of the stout peg under his belt.

Fortunately his belt was securely buckled in front, not buttoned. He twisted and tried to turn, finally fingering his belt to see if he could unbuckle it in case he got up his courage to try it. But that question was not to be put up to him to decide as the buckle had slipt around to the back and with all his squirmings he could not get it within reach of his fingers.

He rested with one arm over the cross-arm, his feet very insecurely placed on the cross-arm below, and the pole too far away to reach. He tried a few yells for help but they cracked in delivery, so he gave that up.

He had come across lots from the factory and struck into his own street near the end of it, where there were no houses for a long distance and rarely a passerby.

Another factory recently built on a side street had caused the electric lighting company to put up a transformer for that neighborhood. "Don" and "Will" had watched and assisted at the installation of that transformer. The cat had chosen to ascend the very pole that held the transformer. As it began to get dark "Don" noticed the humming of the transformer increasing. He could see Will Merton's house away down the street. Their lights appeared and "Don" could imagine the family all gathered about the supper-table.

The Cat Had Chosen to Ascend the Very Pole that Held the Transformer. As it began to Get Dark "Don" Noticed the Humming of the Transformer and He Could See Will Merton's House Lighted Up Down the Street. Try as He Might, He Could Not Extricate Himself from the Cross-Arm. Suddenly a Bright Idea Flashed Across His Mind—Why Not Cut the "Secondary" Low Voltage Wire and by Interrupting the Light Current, Signal His Dilemma by Dots and Dashes, to His Friend Will Merton.

The transformer was humming louder now. An idea suddenly came to Donald. After a terrific squirm he succeeded in getting the fingers of his free hand on the chain of his wire-cutters which, out of school hours, he always carried attached to his person. With the wire-cutters clasped firmly in his right hand he reached for the secondary lead of the transformer which hung in a loop over his head. He knew that it was safe enough to tackle that wire without gloves, as it carried only 110 volts. It was hard work and took a long time, but the trusty wire-cutters did the trick. There was a blinding flash and the loop was cut. Donald could see that the Merton's house and others nearby were dark. He grasped one wire in his right hand, then by touching this to the other, which hung loose, he caused a short flash of light in all the houses, then followed this by two long flashes, which was his chum's private wireless call. He repeated this carefully, then

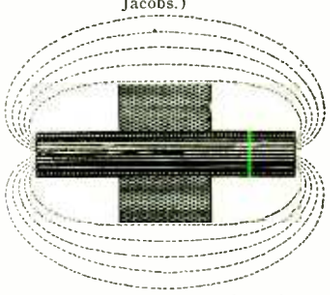
LATEST PATENTS

Process of Galvanoplasty.

(No. 1,296,453, issued to Blasius Bart.)

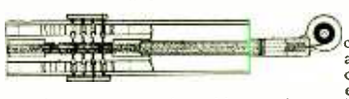


By means of this new development it is possible to obtain by

means of electrochemical steps, copies in all sizes, reproducing every feature and detail of the model. The copies can be made entirely in one piece having uniform thickness. A matrix is placed upon the model and so fixt that it will reproduce each detail. This matrix is composed entirely of a metallic substance of high electrical conductivity to receive the electrolytical deposits. A means is also provided whereby a non-conductive covering can be applied on the matrix where no electrical deposits are required. One wire is then connected with the matrix and the other to a sprayer or atomizer, whereby a metallic composition is used to cover the surface of the metal.

Spark Coil.

(No. 1,296,963, issued to George A. Jacobs.)

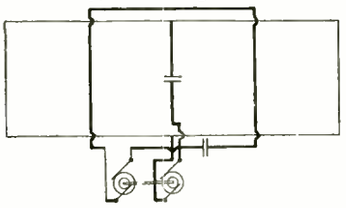


Most spark coils are dependent on the air for return magnetic circuit between both ends of the core. To overcome this difficulty of the high magnetic resistance of the air, the inventor employs soft iron wires for the secondary winding, thereby helping to partially close the external magnetic air circuit. It consists essentially of the usual core over which insulation is placed and then a primary coil of heavy copper wire; on the insulating tube over the primary is a winding of fine insulated iron wire, forming the secondary.

Apparatus for Sherardizing.

(No. 1,291,866, issued to Herbert Champion Harrison.)

This invention consists of a new and simple method of sherardizing articles which are of narrow width and great length, such as wire or ribbon material or small cross-section bars, etc. It consists essentially of an elongated chamber containing the sherardizing powder. A second

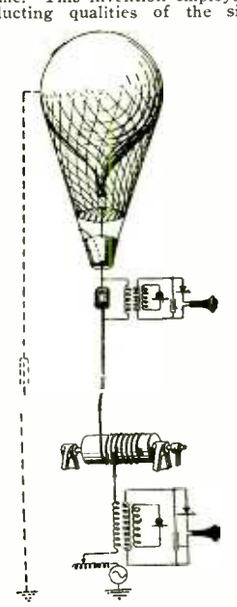


chamber also contains this powder. The third chamber contains an air seal and substantially cold sherardizing powder adapted to gradually reduce the temperature of the article after the sherardizing re-action. The second chamber containing the sherardizing powder also has a hopper above it, so that the sherardizing powder can float freely into the chamber. A movable system of taking up the long ribbon or wire for carrying it thru the various chambers is provided and an electric pyrometer is used.

Aërial for Radio Signaling.

(No. 1,296,177, issued to Charles Franklin.)

Makes use of two equal rectangular or frame aërial circuits erected in the same vertical plane so that they have one vertical edge common to both (or parallel). The two circuits will have no mutual inductance or coupling effect on one another if they are properly proportioned; that is to say, alternating currents ex-



isting in one will not affect alternating currents existing in the other. Under these conditions each circuit tends to produce its own radiation independently of the other circuit. The radiation will then have a maximum value in one direction only, gradually diminishing in value to zero at 90 degrees on either side of this maximum direction, and being practically zero thruout the other 180 degrees.

Signaling from Balloons.

(No. 1,296,687, issued to Harold W. Nichols.)

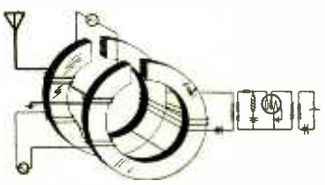
A unique method for signaling to and from captive balloons over the single steel cable by which the balloon is anchored to earth. No additional wires are necessary in this scheme. This invention employs the conducting qualities of the single

cable connecting the balloon to earth as one side of the circuit, and the circuit is completed by virtue of the electrostatic capacity between the balloon and the ground. To enhance this effect, the balloon may be covered with tin-foil for a portion of its area, or the rubber covering otherwise metallized.

Submarine Destroyer.

(No. 1,296,646, issued to George H. Georgelis.)

The craft illustrated has an exterior hull so that it is continuous and adapted to rotate about the car or body of the craft and which

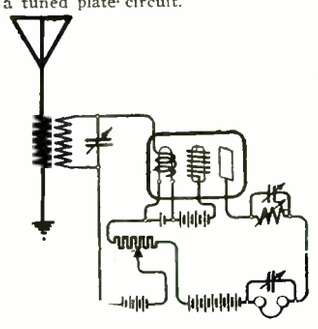


is driven for propelling the craft thru the water at a high rate of speed due to exterior spiral fins mounted on the hull. A sharp steel prow or ramming point is provided at the forward end of the submarine destroyer, as well as periscopes for locating enemy craft, subsea and wireless telegraph apparatus, anti-submarine guns, etc. The hull may rotate about the shaft and periscope plug without disturbing the position of the periscope. The hull is mounted upon a plurality of rollers which constitute bearings between the hull and the shaft. A suitable motor or engine is employed for propelling the craft.

Modulating System.

(No. 1,287,982, issued to Ralph V. L. Hartley.)

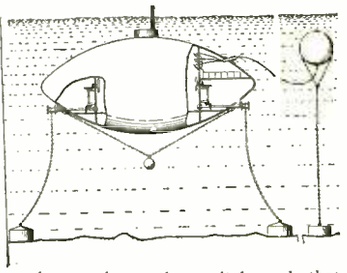
The quality of the speech transmitted by ordinary magnetic modulators is relatively poor, as the modulated high frequency wave form is distorted by the hysteresis of the magnetic core used in the modulator. In the present modulator this hysteresis of the magnetic core is reduced by subjecting the core to a relatively weak but rapidly alternating "cross-magnetization," which



keeps the molecules of the iron in a constant state of agitation, rendering them more susceptible to changes in the longitudinal magnetization produced by the modulating speech currents.

Radio Receiving System.

(No. 1,291,527, issued to Albert W. Hull.)

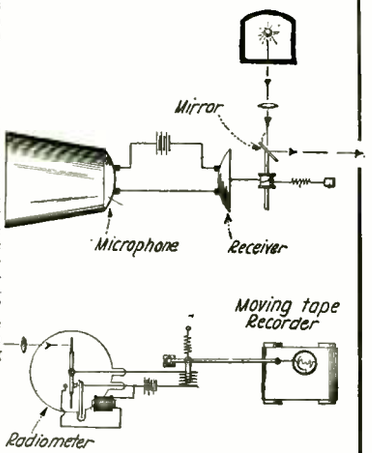


A vacuum tube device intended for amplifying variable currents, particularly received radio signals. This patent covers an improved circuit arrangement in which a four-electrode audion may be utilized for receiving radio signals, whereby the sensitiveness and selectivity of the receiving circuit may be greatly increased. By this arrangement undamped wave signals may be received by means of the "heterodyne" or beat method. A special telephone circuit is utilized in connection with an inductance and capacity, giving a tuned plate circuit.

Submersible Mine Controller.

(No. 1,296,816, issued to Jan A. and Albert Krecioch.)

The submersible feature of the outfit permits the unit to submerge and thus protect itself should the occasion demand it. The operating devices include a switchboard, to which are connected the various circuits connecting with the mines lying in different numbered sections of the adjacent water. When an enemy ship lies within the numbered square corresponding to the mine of that number, then the officer in



charge closes the switch and that mine or any group of mines instantaneously explodes. Observation may be carried on by a periscope.

Apparatus for Recording Sounds.

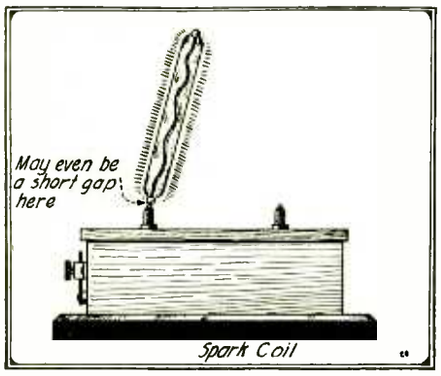
(No. 1,294,861, issued to Lindon W. Bates.)

This idea mainly consists of a means of using the oscillations produced in the receiver by the sound waves to produce oscillations of light waves, which in turn will break an electric circuit. The time of breaking of the circuit is recorded by a standard recorder and also its duration. These several operations are practically instantaneous. The time of breaking may be taken as the time for the receipt of the sound in the detector. A horn or microphone is used for collecting the sound waves and directing them to a microphone attached to the diafram of the receiver, on which a thread of silk passes around a drum, after which it is attached to a very delicate spring. With this arrange-

ment vibrations imparted to the diafram and microphone will cause the compression of the granules of carbon, the microphone thereby setting up a current in the receiver. This in turn pulls the fine silk thread on the drum, and to the spindle of the drum is attached a mirror with a light shining on it. This pulling back and forth of the drum causes the changes in the light waves which are taken up by a radiometer, and by means of relays the current so set up actuates the drum stylus and records the sound waves.

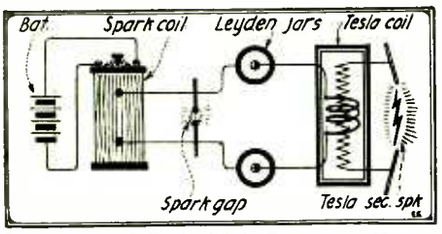
THE ORACLE

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:



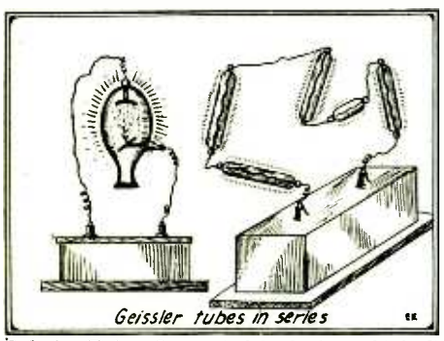
1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., **must** be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of **25 cents** is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

TESLA COIL AND GEISSLER TUBE HOOK-UPS.



(1012) A. Terkel, Reedley, Cal., asks:

Q. 1. For a diagram of connections for Tesla coil, Geissler tubes, etc.



A. 1. We are pleased to give you herewith the diagram of connections for two inch spark coil. Tesla coil, Leyden jars, Geissler tubes, etc.

Lighting Geissler Tube from One Terminal of Spark Coil.

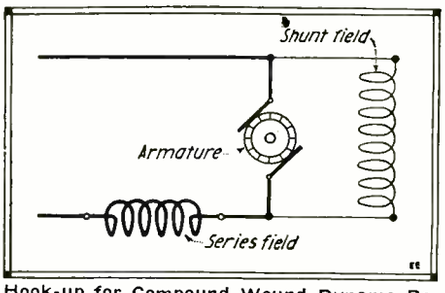
Connection of Tesla High Frequency Transformer, Leyden Jars, Spark Coil and Gap.

Geissler Tubes Connected in Series. At Left —A Fancy Vertical Pedestal Tube.

CHANGING SPEED AND VOLTAGE OF DYNAMO.

(1013) M—, Telephone System, Michigan, writes:

Q. 1. We have a 240-volt, 12.5-ampere, 4-pole, 1,250 R.P.M. dynamo. The four high resistance windings were in series with each other and the complete resistance connected to each feed; also the fields have another low resistance winding which carries all of the current going to the main line. In other words, it is *compound wound.*



We have altered it by connecting the four high resistance field windings in multiple with each other and the armature, but have left the low resistance winding of the compound field unaltered.

We are using it at 40 volts, at which we seem to require to run it at 450 R.P.M.

Kindly state what the amperage, voltage and speed in R.P.M. should be when used thus, and if the dynamo is as efficient when so used.

A. 1. Considering that the dynamo when operated at 1,250 R.P.M. produces 240 volts, and that it has four field poles fitted with four shunt field coils, then, as is the case with practically all classes of dynamos, the voltage will vary directly with the speed, and if a dynamo is to be operated to produce 40 volts, then the speed should be approximately 1/6 of 1,250 R.P.M., or 208 R.P.M. For this voltage the four field coils should be connected in parallel, which would adapt them to operation at the reduced voltage, but the speed of the machine might have to be run up to between 300 and 400 R.P.M., owing to the fact that you could not obtain a sufficiently low resistance in your shunt field for 40-volt operation by connecting the four coils on parallel.

Originally, each of the four shunt field coils took 60 volts, and thus under ordinary conditions when you connect the four shunt field coils on parallel, you adapt them to operation on that potential, viz.: 60 volts, and not 40 volts. As these field coils will require, in accordance with Ohm's law, more than 40 volts, to force the necessary current thru them in order to produce the same number of ampere-turns and magnetic flux per pole, as becomes evident, it will be seen that the dynamo will have to be operated at a greater speed than 1/6 of the original value.

Hook-up for Compound Wound Dynamo Referred to in Rewinding Query No. 1013.

With regard to the amperage of the machine, this would be less than that in the original output, as there would be higher ohmic losses in the armature and field due to the reduced voltage, in proportion to those present when the machine was originally operated at the higher potential, or 240 volts. Roughly, the amperage would be probably about one-half of the original value.

To Practical Men and Electrical Students

THE BURGESS BLUE BOOK is a pocket size note-book which was compiled especially for practical men, and those who are taking up the study of electricity. It contains drawings and diagrams of electrical machinery and connections, over two hundred formulas for calculations, and problems worked out showing how the formulas are used. This data is taken from my personal note-book, which was made while on different kinds of work, and it will be found of value to anyone engaged in the electrical business.

The drawings of connections for electrical apparatus include Motor Starters and Starting Boxes, Overload and Underload Release Boxes, Reversible Types, Elevator Controllers, Tank Controllers, Starters for Printing Press Motors, Automatic Controllers, Variable Field Type, Controllers for Mine Locomotives, Street Car Controllers, Connections for reversing Switches, Motor and Dynamo Rules and Rules for Speed Regulation. Also, Connections for Induction Motors and Starters, Delta and Star Connections and Connections for Auto Transformers, and Transformers for Lighting and Power Purposes. The drawings also show all kinds of lighting circuits, including special controls where Three and Four Way Switches are used.

The work on Calculations consists of Simple Electrical Mathematics, Electrical Units, Electrical Connections, Calculating Unknown Resistances, Calculation of Current in Branches of Parallel Circuits, How to Figure Weight of Wire, Wire Gauge Rules, Ohm's Law, Watt's Law, Information regarding Wire used for Electrical Purposes, Wire Calculations, Wiring Calculations, Illumination Calculations, Shunt Instruments and How to Calculate Resistance of Shunts, Power Calculations, Efficiency Calculations, Measuring Unknown Resistances, Dynamo and Dynamo Troubles, Motors and Motor Troubles, and Calculating Size of Pulleys.

Also Alternating Current Calculations in finding Impedance, Reactance, Inductance, Frequency, Alternations, Speed of Alternators and Motors, Number of Poles in Alternators or Motors, Conductance, Susceptance, Admittance, Angle of Lag and Power Factor, and formulas for use with Line Transformers.

The "Burgess Blue Book" is published and sold by the Burgess Engineering Company for one dollar ($1.00) per copy, postpaid. If you wish one of the books, send me your order with a dollar bill, check or money order. I know the value of the book and can guarantee its satisfaction to you by returning your money, if you decide not to keep it after having had it for five days.

THIS BOOK IS RECOMMENDED BY PRACTICAL MEN.

It is surprising how much information, drawings, etc., can be concentrated into a pocket size book. These books should sell fast as when practical men who have any ambition to go ahead, wants one as soon as he sees it. I wish you every success, and will do my best to interest my brother workers in this work.
Yours truly,
J. J. Hanhauser, L. U. No. 98, I. B. E. W.

Received your BLUE BOOK, showed it to a friend, presto, I have no BLUE BOOK now. Enclosed find check for which please send me three more copies.
Yours very truly, E. F. Leisy, Tacoma, Washington.

The concise form of the BURGESS BLUE BOOK should appeal to the men on the job. It is 100 per cent information. J. L. Sleeper, Santa Ana, California.

Received your "BLUE BOOK" and must say it is the best book I ever saw. I showed it to a friend of mine and he refused to give it back to me, but he paid me a dollar and told me to get another. Rather than be without this book I am sending Money Order for three of them so I can show them to two more of my friends and have one left for myself. Wishing you would mail them at once, I am Joseph Braith, Electrician, Madison, Wisconsin.

Your "BLUE BOOK" received and it is just the book I have been looking for. Please mail me three more by return mail for which I am enclosing Money Order.
Respectfully,
V. E. Johnson, Western Union Tel. Co., Marion, Ohio.

Have received the copy of the "BURGESS BLUE BOOK" and am very well pleased with the easily found formulas and data contained in it. I am enclosing Money Order for four additional copies.
Yours very truly, Thure C. Anderson, Ridgeway, Pa.

750 East 42nd Street Chicago, Illinois

ELECTRICITY

Taught By A Practical Man

And In Your Own Home

Put Part of Your Spare Time To A Good Purpose

A HOME STUDY COURSE FOR AMBITIOUS MEN

My Home Study course is actually an extension of a consulting engineering experience, which gives my students an opportunity of becoming familiar with electricity as applied to everyday work, and to understand how to manufacture, maintain, test, locate troubles and repair electrical apparatus and machinery.

MY PURPOSE

This course was designed and written by me with a view of reaching those who do not have a lot of time and money to devote to an electrical education. Some of my students are beginners, some have had a little experience, some have been in the game for years, but all are ambitious and trying to get ahead and realize that the SERVICE I am able to give is valuable and of such a nature that they have been unable to obtain it in any other way.

NOT A CUT AND DRIED BOOK PLAN

In addition to my practical and consulting experience, which covers a period of seventeen years, I have designed instruction courses for various educational institutions which has given me an unusual opportunity to study the teaching business from the standpoint of a practical man. I certainly would be a chump if I did not understand the situation and realize what was needed, after the opportunities I have had through which to learn what men need in order to make good in the electrical industry. For years. I made notes of small jobs, large jobs, and big installations, including maintaining, troubles, testing and repairing, and laying particular stress on the unusual things. This information is included in my regular lessons and anyone engaged in electrical work knows it is the kind of information he needs and wants.

BEGINNERS AND EXPERIENCED MEN

My course of study and SERVICE suit both beginners and experienced men, but they must have backbone and work with me as I work with them. This I insist on, as my SERVICE is my bread and butter and I will not waste it on one who will not be a credit to me. Anyone with an ordinary education and a good knowledge of the English language can successfully complete this work and make good in the electrical field, if he attends to business and follows my instructions. I do not tell you that I will fit you to qualify as an Electrical Engineer in a couple of months, because it cannot be done. Neither do I say you can earn fifty or one hundred dollars a week when you complete this work with me, as I, or any other man cannot correctly estimate the earning capacity of a student. How much you may earn depends on you as much as it does on me and my service. Many men I have taught are earning very large salaries and there are men who have doubled their earning capacity in a very short while, through my help, but how good *you* become, IS UP TO YOU. If you are in earnest, look into this proposition and send for my catalog, which tells the whole story in a plain, simple way, and in a way you cannot misunderstand and expect something you will not get.

RESULTS OF MY SERVICE

Practical Men Recommend My Course to Others.
My Students Are Invariably Promoted and Get Better Salaries.
Over 65 Percent of My Students are Engaged in the Electrical Business.
Over 11 Percent of My Present Enrollment was Obtained Through Satisfied Students.
Beginners are Able to Get Employment in Electrical Work After Taking My Course a Short While.

FIFTY-FIFTY

I work absolutely on a fifty-fifty basis with my students. You pay me the comparatively low price I ask and I give you the instruction and other help as detailed in my catalog. No student is permitted to pay for his course in full on starting, the payments being made in monthly installments. Students have the privilege of discontinuing the work if they find it is not just what they wish, and their payments stop at the same time. This is my way of doing business and a part of my fifty-fifty plan, as I do not want money from men whom I am not helping.

APPARATUS, INSTRUMENTS, MATERIAL, ETC.

Certain electrical apparatus, instruments, charts, drafting materials, etc., as described in the catalog, are included as a part of the course for which there is no extra charge as it is covered by the regular monthly payments.

Fill Out Coupon or

Write me and I shall promptly send you one of my catalogs which contains full information regarding my course and the service I offer.

Treat Yourself in Nature's Way

The Therapeutic White Rays of the Sterling Lamp are a scientific adaptation of the marvelous healing properties of the sun's rays. The warm, soothing, soft, white rays penetrate and vitalize every cell and tissue; new cell growth is stimulated; the body is refreshed and vitalized.

It brings you a clear, unblemished skin, rose-tinted cheeks, bright eyes; quickens the sluggish blood, rebuilds firm new muscle, and clear, new skin.

STERLING THERAPEUTIC LAMP

"The Light That Heals"

Relieves pain without destroying vitality. Absolutely safe; no vibration, shock or pain. Does away with use of harmful drugs. Relief from pain results the moment you snap the electric switch. Rheumatism, neuralgia, sore throat, earache, goitre, headache, nervous conditions, and innumerable other ailments, are instantly eased and relieved. Invaluable in the treatment of skin diseases. Physicians endorse and recommend Therapeutic Light to you.

Send Coupon for Free Book

Nothing vague or mystic in the Sterling Lamp. Our free book tells of its uses and many benefits—deals with the simple, fundamental laws of health and beauty. Tells you how to treat yourself at a few cents in cost, relieving you of pains and ailments and awakening your energy; how others in hospitals, sanitariums and thousands of private homes have benefited. Don't suffer headaches and other pains needlessly—let Nature and Science help you to health, beauty and greater vitality.

Brilliant Lights and BIG PROFITS in BATTERY CHARGING with this HB LIGHTING and CHARGING SET

This sturdy, dependable outfit makes electric lights at lowest cost, and besides brings the BIG PROFITS that battery charging pays. Operates from your line shaft or engine. Trouble proof, economical, no wear-out. Charges auto batteries and furnishes electric light at same time.

Small Payment Puts This Money-Maker In Your Garage

Balance on easy terms. Pays for itself as it runs. Absolute Money-Back Guarantee. Write TODAY for information and prices. Let our Service Department recommend size to use in your garage. Pin ad to your letterhead and mail now for full information

HOBART BROTHERS CO.
Box E73, Troy, Ohio.
Successful Mfrs. since 1893.

ELECTRICAL training again open to civilians. Over 3000 men trained for electrical industries in experience of more than a quarter of a century. For men of ambition and limited time. Condensed course in Electrical

ENGINEERING enables graduates to secure good positions and promotions. Theoretical and Practical Electricity, Mathematics, Steam and Gas Engines, Mechanical Drawing. Students construct dynamos, install wiring and test **IN ONE YEAR** electrical machinery. Course with diploma, complete.

Thoroughly equipped fireproof dormitories, dining hall, laboratories, shops. Write for catalog. 27th year opens October 1, 1919.

The Oracle

(*Continued from page* 240)

HOW AND WHY OF RADIO APPARATUS SERIES.

(1015) Salvador C. Bayani, Manila, Philippines, writes this Department:

Q. 1. For a list of the "How and Why of Radio Apparatus," and in which issues the various installments appeared.

A. 1. Below we give a list of these:

No. 1. *The Induction Coil, Page* 493, *November,* 1916.

No. 2. *The Transformer, Page* 656, *January,* 1917.

No. 3. *Condensers, Page* 735, *February,* 1917.

No. 4. *Spark Gaps, Page* 113, *June,* 1917.

No. 5. *Radio Transmitting Inductances, Page* 537, *December,* 1917.

No. 6. *Radio Receiving Tuners, Page* 685, *February,* 1918.

No. 7. *Radio Receiving Condensers, Page* 766, *March,* 1918.

No. 8. *Detectors, Page* 30, *May,* 1918.

No. 9. *Telephone Receivers, Page* 176, *July,* 1918.

Radio men everywhere will undoubtedly like to obtain the complete set of these specially prepared papers on the "How and Why of Radio Apparatus." Also the following three important and timely papers on the "Calculation and Measurement of Inductance," by Secor and Cohen.

Nos. 1, 2 *and* 3 *"Calculation and Measurement of Inductance," appearing in the March, April and September,* 1917, *issues.*

Those interested in these valuable papers can obtain prices of individual back numbers containing them by writing to the "Circulation Department."

SCIENCE IN SLANG.

(*Continued from page* 239)

"But your explanation of the etheric disturbance against the wall seems to me that the etheric vibrations disturbing the ether in the place where it came in contact with an object would send pulses into the air that would be equivalent to reflection or refraction. You know what I mean, don't you? I can't explain it exactly."

"Yes," replied Jazz, "I believe I do. If the stream of cathodic rays were regular that condition would be possible, but for the fact that they are not regular I don't see but why they would not myself. Then, too, the etheric vibrations would not effect like the cathodic discharges.

"However, there is a condition that was explained by J. J. and a bird with my name, but no relation of mine, of Cambridge, and Prof. Lehmann, of Karlsruhe, and seems not such bad dope. They all bounced up with the conclusion that bodies that absorb x-rays have power to create other rays likened to the x-rays to such an extent that the old static machine could not tell them apart—if there was any diff at all. They called it 'secondary radiation'—but, for that matter, the x-ray is that.

"What made them get onto that stuff was that they found indications of their 'luminiferous ether' behind objects that absorbed all the light, and if the rays were not reflected or refracted how in the —— did they get there? Stokes (no relation of mine) figured it out mathematically that such pulses, or extremely short disturbances of ether would act in that way and be acted upon in that way."

"What all do the doctors tell with the x-ray?" asked Bender.

"Well," began Jazz, with a smile, "they are able to detect the presence and the extent of tuberculosis, pneumonia. pleurisy, hydrothorax, emphysema, empyema, and other such disorders and ailments——"

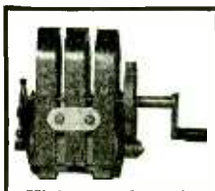
"Yes, and water on the brain, lovesickness and obesity," added Punk.

Advertising Talks

NUMBER 4

LAST month, I showed you how advertising made a firm spending many thousands of dollars a month keep up the high quality of its goods or whatever it has to sell. I gave you good proof of how every dollar advertisers spent in the ELECTRICAL EXPERIMENTER was your assurance that what you bought from them must be up to the standard so that the advertiser might hold your trade and stay in business.

Naturally the thought comes "who pays for this advertising? Can the advertiser really pay out a small fortune each month without going 'broke,' or does he add a certain percentage to the price of his product to pay for the advertising, and do I in the long run really pay his advertising bills?" **No, indeed, far from it.** True it is that the advertiser must get back in profits what he spends for every expense connected with his business. But nevertheless you really save money by dealing with advertisers as you can readily understand by studying the matter carefully for a few minutes.



It stands to reason that the more business a concern does, the cheaper it can conduct its affairs. The small firm handling only a few orders each day and trusting to luck that customers will find their way to its doors, must make a fairly big profit on each transaction. The live, up-to-date firm, doing a business all over the country (and sometimes the world, if it advertises in the "Experimenter") systematizes its operations so thoroughly and with the use of the latest and best machinery, can turn out better products at a lower cost than its slow, unprogressive competitor. The larger the production of any one article, the lower the cost of manufacture of each individual piece, as any keen business man will tell you. Furthermore, with a large volume of orders a firm can afford to make a very small profit on each order and still, in the long run, make as much profit as the non-advertiser. And then, as an attractively low price (quality considered) is necessary to get and hold your trade and so make their advertising really effective, all far-sighted advertisers are in the habit of marketing their goods at the smallest profit they can successfully do business on, relying on a big volume of orders to keep going.

So you see that not only can an advertiser make what he sells more cheaply, but he can run his business at less expense, and he can afford to cut his profit on each order to a very small figure. This means that you get what you order from an advertiser at a cheaper price than possible elsewhere, and yet the advertiser makes enough profit *by advertising* to pay his advertising bills.

Advertising Manager.

EXPERIMENTERS!

Read every word on this page. Note the wonderful goods we are offering at rock-bottom prices. Read the details of our offer of $10.00. Don't miss anything or you will lose money.

High grade telephone magnetos—guaranteed quality; strong and substantial; output 80 to 110 volts A. C. 4 bar, 8 lbs.....$2.25
3 bar, 7 lbs.... **1.75**

Telephone ringers, or bells, of same type sold to telephone companies all over world. Perfect shape. With gongs—1000 ohm (like cut), 1 lb. $1.25
1000 ohm other styles, 1 lb.. .75
80 ohm, 1 lb. .... **.50**

Fixed telephone condensers. All capacities from ½ to 2 M.F. Tin foil and rice paper. Excellent condition.
2 M.F., 2 lbs. $.60
1 M.F., 1 lb. .50
½ M.F., 1 lb..... **.40**

Telephone Switchboard, keys or switches. German silver springs. Two switches mounted on one escutcheon. A wonderful and useful addition to your laboratory. 1 lb. .. **1.50**

Watch case receivers, double pole permanent magnet 75 ohms. composition shell. Very handy for experimenting and wireless, 12 oz. $1.25
Single pole, like cut, metal shell, very sensitive. 12 oz. **1.00**

High grade telephone receivers used on all telephones. Very sensitive. With cord, New..$1.25
Other styles 1 lb. 1.00
Stromberg-Carlson fool proof metal type. 1 lb. .. **.80**

Headband receivers, with long cord attached. 75 ohms. Very good for wireless. Extremely sensitive and more handy than plain watch case. 1 lb. .. **1.75**

Sensitive transmitters and arms complete as shown with Skinderviken transmitter button. 2 lbs. $1.75
A very convenient mounting for a transmitter. Adjustable. With other make transmitters, 2 lbs. **1.50**

Local battery or magneto induction coils provide a very desirable instrument. Make fine medical coils. Steps up sound in telephone. A cheap but effective amplifier, 6 oz. ..... **.40**

When ordering any of the equipment shown here, be sure to remit enough for postage. Any excess will be refunded. All apparatus is guaranteed high grade commercial type the same as supplied to largest telephone companies all over the country.

Here is a low priced commercial telegraph key. Strong and substantial, neat in appearance. Excellent contact points and bearings. Works very easily, with just the right touch. Adjustable springs. 1 lb. **1.25**

A large neat sounder, with a sharp "click." Aluminum lever, solid brass base. 20 ohm rubber covered magnets, large adjusting nuts, mahogany base and large binding posts. 1½ lbs. A bargain at..... **2.00**

Want Ten Dollars?

SINCE we began advertising the SKINDERVIKEN TRANSMITTER BUTTON about six months ago, we have supplied thousands to experimenters not only in this country, but in Canada, Australia, Europe and South America.

It is interesting to note the various uses to which these Buttons will be applied. The question is—"What are you doing with your button?" We would like to know, as there are thousands of other experimenters who would like to use it for the same purpose.

We will make it worth your while to submit your ideas. We are going to pay $10.00 cash for the best idea. All others, accepted by us, will be paid for in proportion. Now then, get busy, you fellows.

Any idea you may have of using a SKINDERVIKEN TRANSMITTER BUTTON will be all right. However, try to make it original.

Actual size

THE SKINDERVIKEN TRANSMITTER BUTTON is an improved compact microphone. It is extremely sensitive, easily adaptable to telephones, detectiphones, deaf phones, radio telephones and electrical experimenting. We have received dozens of letters from experimenters telling us of "its wonderful work." We furnish a booklet of instructions and diagrams for experimenting, also with outlines of suggested experiments.

We know from experience that you will find the Button a very interesting piece of apparatus. It is so very sensitive and it only needs one dry cell for its operation. Lots of fun can be had from its use.

The Electrotechnician

Enters the Electrical Field as a High-Salaried, Industrial Specialist.

If you desire to qualify as a Power Plant Superintendent, Electrical Draftsman, City Technician, or Supervisor of Electrical Equipment Maintenance—

Study Electrotechnics:

The time to start is right now,—when the field is unlimited—uncrowded. Industrial organizations everywhere are demanding the services of trained Electrotechnicians.

At This School Only

can you prepare especially for the field by taking the special, condensed course in Electrotechnics. The system of combined work-shop, laboratory, drafting and recitation room instruction quickly and thoroughly equip you to assume positions of importance in the industrial world.

Open to all Grammar School graduates. High School or College work credited to give you advanced standing, enabling you to shorten course from 6 to 18 months

"Earn While You Learn" if you like.

New Term Opens July 2d.

There's no time for delay if you wish a place reserved for you. Clip the coupon NOW for catalog and full particulars. It may mean your start on a new career.

School of Engineering of Milwaukee,
95-373 Broadway, Milwaukee, Wis.

BOYS
Build and Fly Your Own Training Plane

Train yourself in Aviation. Be an Amateur Aviator with an Aeroplane of your own. Learn how Aeroplanes are built; learn the principles of construction, operation and control. We sell IDEAL Accurate Scale Drawings, and Building and Flying Instructions which show you how to build a perfect Model Aeroplane, 3 ft. size, that will rise from the ground by its own power and fly like a big one. Send now for the Drawings and Instructions for the one you want to build.

Drawings and Instructions for
Curtiss Military Tractor
Bleriot Monoplane
Nieuport Monoplane
Taube Monoplane
Curtiss Flying Boat
Wright Biplane
Cecil Peoli Racer

25c EACH
Set of Seven $1.50 postpaid

Ideal Model Aeroplane Catalog 5c—None Free

Tells about Model Aeroplanes, Racing Aeroplanes, Flying Toys, and parts and supplies to build them with. 48 pages. Sent only upon receipt of 5 cents.

IDEAL AIRPLANE & SUPPLY COMPANY
159-161 Wooster St., New York City

Be a Mining Engineer

A great profession, not overcrowded, offers the diligent and ambitious student assured and exceptional rewards. *Located in the heart of one of the greatest copper mining districts in the world,* the College offers a unique combination of theoretical instruction with practical experience in all phases of mine development and operation. Four year course can be completed in three. Vast mines, mills, smelters, electrolytic and power plants of the most modern type, are practically a part of the College equipment and constitute a factor of enormous value in the courses of instruction. Every opportunity for specialization. A state supported college not conducted for profit. Established 1886. "M. C. M. Men Make Good." For descriptive book address Administrative Officer, Houghton, Michigan.

Michigan College of Mines

A Dash to the Clouds

(*Continued from page 206*)

cars themselves are spanned with large wings, measuring eighteen feet from tip to tip. In addition to this spectacle, several other new features are being added to the great list of amusements for the public during the season. Principal among these is the "Witching Waves," a delightful ride in the imitation of an ocean trip. An added feature is a new pony track for those who like the hobby horses. Another novel innovation will be the "U-Boat Dodger," being a ride in a small submarine boat carrying passengers and chasing another submarine. The "Tub Race" is also a new novelty. In addition there will be a new gigantic "Roller Coaster" with a 3,000-foot ride with eight of the biggest dips ever constructed, which will be equal to some of the nose dives now made famous in plane flying. This new roller coaster will cost about $25,000. The "Canals of Venice" is another interesting attraction; cost of construction, $5,000. A very interesting addition to the Park will be a large scale model of a coal mine, showing a cross-section down thru the entire region, also the street above. Here small figures automatically will go thru hundreds and hundreds of different moves, people on the street hurrying back and forth from stores to their homes, trolley cars in action, automobiles, shaft elevators in the coal mine, running up and down with men, little coal cars will go back and forth with their loads and rise to the surface and every little intricate detail of coal mining operation will be faithfully reproduced in this miniature model.

The building which was devoted last year to foreign buyers' markets and interesting collections from the world over has been turned into a skating rink this season, due to the fact that the unforeseen circumstances of the war made it impossible to get sufficient exhibits from foreign countries to run the exhibition hall this season. It is to be hoped that within the next twelve months or so conditions will have so settled themselves that by next year there may be many interesting trophies from the fields of battle. As it is, this giant roller rink can accommodate hundreds of people. Fancy skaters, those who can't skate so well or not at all, with the aid of the big band and cheery music will forget their little bumps and keep smilingly on.

Perhaps the greatest feature of all amusement resorts, fairs, parks and expositions, is the tremendous amount of electrical equipment necessary to keep all these things in motion, and which is seldom realized by the visiting public. Hundreds of horsepower are consumed hourly by these amusement devices. The power is taken directly from the New York Central Railroad, which passes the grounds, and this power at 660 volts is brought into specially constructed damp-proof vaults, where four 100 K.V.A. large oil transformers shoot the juice to all parts of the grounds. In addition there are several smaller transformers, for special purposes supplying different sections. In this case a tremendous amount of money was saved by installing the 660-volt system to every part of the grounds. These cables are carried thru underground conduits and manholes to points where the power is needed, and there the power is transformed to 220 and 110 volts. The saving in cable alone amounts to thousands of dollars, as by using 660 volts a cable approximately one-third the size is required. This gigantic system of transformers, switches, underground cables, man-holes, etc., has cost $100,000.

An immense fire alarm system has been installed to cover the entire grounds. Should a fire occur at any point, simply the pulling of a hook in a box will cause a large bell centrally located in the park to strike a certain signal, which will indicate to all the employes the location of the fire.

Also, as last year, we have the wonderful bathing pool, with its artificial waves, probably the largest in the world, where hundreds may daily disport themselves in its waters, not forgetting the kiddies with their sand pails and shovels, the big band stand with its towering jewels and sympathetic music.

The Oyster's Autograph

(*Continued from page 207*)

sumption of oysters that have drunk in disease germs in the plumping process.

The trick as carried on by the oyster dealer or grower is that he takes the oysters from their natural depths where they mature, and places them in coves and harbors where fresh water streams terminate. Being less saline, the water is less dense, and hence there is an interchange of the fluids thru the walls of the bivalve. When the oyster opens his shell for feeding or for any purposes, the tissues swell. The oysters are not placed in absolutely fresh water, for this would kill them, but in water somewhat fresher than that where they are grown.

The nutritive value which is lost in this process is quite marked. The fluids which are past out from the tissues of the oyster carry with them salts and some fats, chemical experiments showing that the oyster, tho larger after plumping, has lost 13 per cent. of its original nutritious substance, proteins, fats, carbohydrates and mineral salts. This has been found to be true by experiments conducted by Dr. H. F. Moore, of the U. S. Bureau of Fisheries. He states that with the loss of these fluids passing out from the oyster, sufficient water will have been taken up, however, to increase the total weight of the oyster from 12 to 20 per cent. Therefore, it can be seen that what the oyster has really gained is simply water, which is of no food-giving value at all.

Altho scientists are at a loss to agree upon the precise food that oysters eat, whether the beautiful diatom, a vegetable organism, or other microscopic animalcules, it has been found that in experiments recently conducted oysters planted in the sewage-laden waters of Jamaica Bay, near New York, that the oysters can become marketable after a period of eighteen months. Whereas, normally it takes three years before oysters are of sufficient size for the table. Cutting the growing period in half indicates that oysters are not exclusively partial to the natural foods of the water, but, on the contrary, they have an especial fondness for the city's sewage disposal. When Dr. Nelson finishes his experiments, he will furnish the U. S. Bureau of Fisheries, with whom he is coöperating, a constructive program on the general improvement in the culture of this important food. One of the most important phases of his investigation will be that of studying carefully the relation between environment and propagation. Authorities estimate that a single oyster spawns from sixteen million to sixty million eggs in a year, but not-

withstanding this enormous fecundity of the individual oyster, the propagative power of the beds is not so vast as might be supposed. The oysters may be planted on the bottom, especially prepared by clearing it of all refuse material, and a bed so formed of good clean gravel and shells, in order that the young "spat" will have some object to cling to, as otherwise, in a muddy bottom, they would soon be covered over. Yet with many of these precautions some beds will prove greatly fruitful, whereas others prepared in the same way and in adjacent waters result with very poor crops. Certain locations in various waters are particularly abundant in diatoms, the minute organisms on which the oyster is supposed to feed. Yet it is not the generally accepted fact that the diatom is the main article of the oyster's diet, as can be evinced by the quick growth of the oysters in waters polluted with sewage. Generally speaking it is to be hoped that when Professor Nelson finishes his experiments he will have such an array of data and abundance of far-reaching discoveries that thru artificial feeding and environment a variety of oyster may be produced that will excel any heretofore sold on the market and in addition to its phenomenal size it will be healthful and free from all disease germs. It probably will be possible thru Dr. Nelson's researches on the culture of the bivalve to produce such a type as will rank with the discoveries of Burbank's wonderful achievements in producing new and better varieties of fruits and vegetables. —*Photos Courtesy Star Company.*

Flying Across the Atlantic

By H. Winfield Secor

(*Continued from page 214*)

and increase the speed of the machine about 10 miles per hour. The illustration, A, shows some of these points on Lieut. Hawker's ill-fated 'plane, and among other considerations we would mention the following: Only one engine was used, a Rolls-Royce 375 H.P. airplane engine—and very few aviators would care to start off on such a trip with a single engine where continuous flying may have to be kept up from 22 to 28 hours. If the slightest thing goes wrong with this engine and it stops, it may spell disaster, or at least the failure to make the trip in nonstop form. Lieut. Hawker counted on saving himself if obliged to land in the water by the fact that the fuselage of his 'plane was made water-tight, and he also counted on the buoyancy of the gasoline tank as well as a life-saving suit which he wore. But the ocean is known only to those who have crost it and seen the waves roll up forty feet high. The weather was very uncertain, and a storm was said to be blowing up in mid-ocean when he started from New Foundland.

Among other weak points in this type of 'plane, we find that no pontoons were used. thus giving small chance of the 'plane staying afloat, at least for any length of time beyond a few hours. Also the 'plane was very small and frail. Added to this, we have the almost incomprehensible difficulty of navigating such a long flight over an uncharted course. The aviator would have to fly thru the night and rely only on a compass and a sextant to guide him by the help of the stars, if the clouds did not obscure them. But no pilot vessels or chart marks such as buoys, not even radio compass signal directions, were provided or arranged for. It would seem nothing short of superhuman, under these conditions, for the two intrepid fliers to ever reach the far distant coast of Ireland, as they had hoped to.

Why Not Earn $35.00 to $100 A Week As A Mechanical Draftsman?

"Get into the profession of big pay and Rapid Advancement with the help of the school that has started hundreds on the Road to Success. I am ready to help you." Roy C. Claflin, President, Columbia School of Drafting.

Learn At Home In Spare Time

You don't have to stop work or leave home in order to become a trained Draftsman. Through our practical home study Training we will teach you Right in Your Own Home so that you will soon be able to qualify for a good position at Big Pay. We will continue to instruct and help you until we know you have the knowledge necessary to succeed.

No Previous Training Necessary

Right now—TODAY—there are openings for thousands of Draftsmen in the Government Departments, industrial concerns, and the big engineering offices. One department alone recently called for 1,800 draftsmen. With this tremendous demand has come a big increase in salaries.

Draftsmen Are Getting $35 to $100 a Week

with big chances for even better pay as the demand grows. By enrolling NOW for our practical Home Study Course in Drafting you can quickly qualify for a position as Draftsman and by properly applying the principles we teach.

You Have a Chance to Become a Chief Draftsman

and get to the very top in this fascinating profession. Our course will give you just the knowledge you need. to make good as chief draftsman when your chance comes.

Peace Calls For More Draftsmen

With the problems of reconstruction facing the nation the demand for draftsmen is even Greater Than During the War. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. You can help in the work of reconstruction and secure a Big Salary with excellent opportunities for advancement. Prepare now and be ready when the demand reaches its height.

We Will Help You Secure a Position

as soon as you complete our course. We have already placed hundreds of our graduates in good paying positions and are constantly in touch with vacancies for which Draftsmen are Urgently Needed. Government Departments and Private Concerns are continually calling upon us for our graduates because they know that our instruction produces draftsmen of the caliber they need.

Thousands of Men Wanted Right Now

Drawing Outfit FREE As soon as you enroll you will be sent our special drawing outfit FREE so that you will be sure to have it to work with while taking the course. This set will be yours to keep. You are not asked to return it after completing the course.

Illustrated Book of Particulars Sent Free

Fill in the coupon below—send it to us and we will send you FREE a copy of our illustrated book telling all about our practical Home Study Course and how you may secure our instruction at once on Easy Terms so as to quickly qualify for one of the Big Positions Now Open.

Mail This Coupon To-day

Superiority of the Seaplane.

Fig. B shows the second type of aircraft which has been tried and tested with great success by the U. S. naval flying men for trans-Atlantic work. Not only are these 'planes fitted with large roomy pontoons which are about the size of the usual unsinkable life-boat found at all coast guard stations along the seaboard, but the 'planes have been designed with every possible engineering consideration in mind, particularly any failure of the engine plant. It should always be possible, or let us say feasible, especially when small 'planes are to be used for such trans-Atlantic or trans-Pacific travel, to provide them with an engine plant consisting of more than one engine. But there is no doubt about it that for any form of heavier-than-air machine, such as sea- or airplanes, more than one engine should be installed. With some of the twin-engined biplanes used several years ago it was found possible to keep the 'plane airworthy, and flying on one engine when the other engine, for any reason, failed. The same logic applies to the Navy-Curtiss seaplanes, or "N C" 'planes, as they are familiarly called. Four 400 H. P. Liberty engines are fitted on each seaplane, and if one of these engines should fail, three would be left to maintain the 'plane in the air. However, at least three engines are normally required to keep these heavy ships in the air, as seaplanes are much heavier than land-type 'planes, size for size; the "N C" 'planes weighing with load about 28,500 pounds when they took the big "hop-off" for Europe.

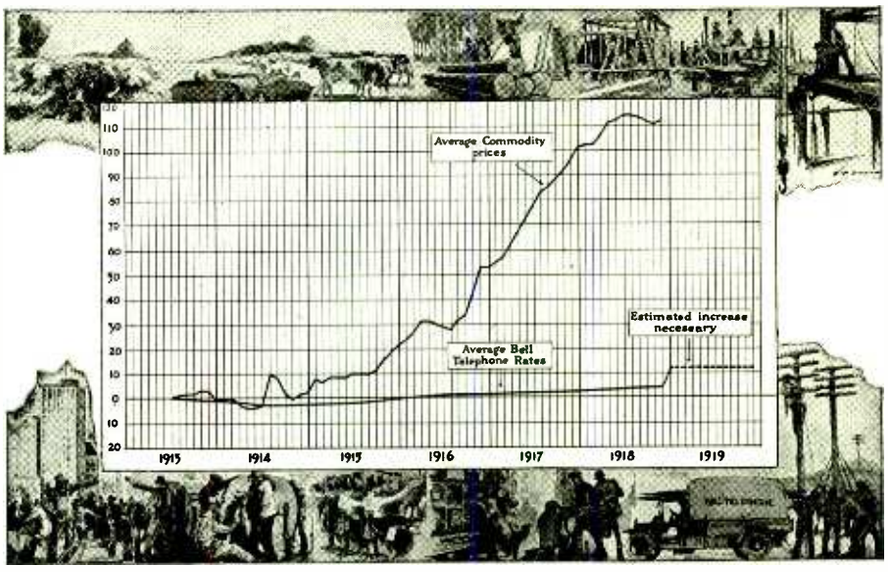
Thus far we see that the Navy's flying boats have two great advantages which should not be overlooked in designing any machine intended for trans-oceanic flight, and among other features which were made available for the flight of the three 'planes on their history-making journey across the broad Atlantic we find the following: Radio-telephone apparatus operating from 'plane to shore or ship stations, and between other 'planes, with a range of 30 to 40 miles; also radio-telegraph apparatus capable of transmitting and receiving up to 150 miles. A new record was made in airplane radio transmission during the seaward flight of the "N C" 'planes, when an unrelayed message was picked up from the NC-4 at a distance of 400 miles, at the Otter Cliffs radio station in Maine. Not only was the regular radio communication made available at every turn, but the U. S. Government exercised special precautions to render certain that the aviators, in case they should have to descend on the ocean, should not lose their lives unnecessarily. It placed warships, including cruisers and destroyers, in a complete chain from the American coast to the Azores, as well as from the Azores to Lisbon, Portugal, the official terminating point of the trans-Atlantic flight by the seaplanes. These vessels were placed about 75 miles apart and closer together in the regions where night flying occurred.

The vessels along the route could communicate by wireless with the 'planes and get their bearings, weather conditions, etc., from the ships of the air as they sped along overhead. At night the war vessels used their searchlights and were otherwise marked with electric signal lamps. On the decks appeared the ship's station number in electric lights, so that the 'planes could see at a glance as they flew ahead just what position on the route they were at. Provision was also made for receiving directive radio compass signals. These considerations and provisions would perhaps seem overdrawn or overimportant to the lay reader, but each and every one of them represents a fine piece of applied engineering and they comprise elements of technique which were not picked out at the eleventh hour and simply slapt on the 'planes, but all of these points were under constant consideration, and in the hands of competent Navy engineers and experts for over two years. By comparison it is seen that no expense of money and brains was spared to make this trip successful—at least, if not successful, "safe" so far as humanly possible. This plan was carried out, thanks to the U. S. Government, to the extent of costing $1,000,000 before the gigantic naval 'planes "hopped off" at Trepassey Bay, on Friday, May 16, in an attempt to cross the Atlantic Ocean thru the air for the first time in history.

The Dirigible.

The illustration Fig. C shows a probable development of trans-Atlantic aircraft which has been mentioned frequently in connection with trans-oceanic travel *via* the air—i. e. the *dirigible*, or gas balloon. The U. S. Naval dirigible C-5 made one of the most beautiful non-stop aërial flights in history, when it covered the distance between Rockaway Beach, near New York City, to St. Johns, New Foundland, a distance of over 1,000 miles, in 26 hours, flying continuously night and day. The naval authorities have announced that they hoped to have another dirigible airship ready shortly to attempt the trans-Atlantic flight. England is hoping to startle the inhabitants of New York City some bright and early summer morning by a visit of one of her 5,000,000 cubic foot, giant dirigibles. With fair weather conditions, it would seem that the modern dirigible, when given a fair chance, will prove a powerful competitor of the seaplane for crossing the ocean. However, the gas balloon possesses, along with some of its advantages, a number of marked disadvantages, and we shall now consider them.

Among the advantages of the gas balloon "lighter-than-air" type of airship, especially when considering long distance flights of 1,000 to 2,000 miles or more, over water, as in crossing the ocean, we are imprest by one predominant fact, and that is that, no matter if the engines all come to a stop on the dirigible, she will still retain her buoyancy in the air and the crew is safe as long as it remains afloat in the air. Under such circumstances there are two major things which may and can happen: first, the winds would blow the balloon along at a fairly high speed and usually the crew is safe in the air and not resting on the waves. The latter, when the sea is rough, often rise to heights of 30 to 40 feet or more, and if the engines or necessary apparatus cannot be repaired, then the dirigible can hail or radio a steamer, and the crew taken off. This could be accomplisht by means of a rope ladder, as has been successfully tried by the U. S. Navy off the coast of Florida, as described in the article on page 108 of the June issue. Secondly, while the dirigible had her engines stopt, the mechanics would be endeavoring to repair them and get them in working order again. The speed of the new type of dirigible such as used by the U. S. Navy, is fairly high, viz: 50 to 60 miles an hour, and these airships have great lifting power, so that they present a very logical answer to the aërial passenger ship requirements of the future. Another advantage which they possess, and due primarily to their great lifting power and buoyancy, is their long range of operations—it being possible for them to take on board sufficient engine fuel to accomplish trips of several thousand miles. Another advantage of such an airship is that, if the engines suddenly stop, the steering gear can be maneuvered and other arrangements made whereby she can be brought to earth gently and in good order; contrary to the usual tactics when the engine of the ordinary airplane stops, which has caused many accidents, owing to the sudden loss of buoyancy of the 'plane and the rapid dive earthward, which may or may not end disastrously.



The disadvantages of the dirigible are several, and among the first and foremost we are forced face to face with the fact that they are distinctly difficult to manage and maneuver in stormy weather or high winds. It will probably take some years for our aëronautical engineers to devise means, such as by sub-dividing the gas bag of the dirigible, or by other design tactics, so that the great resistance now offered to the wind will be circumnavigated. If you have ever been up in a "blimp," such as the observation balloons used extensively during the war are called, then you will be in a position to know just what these dirigibles are up against with a heavy wind blowing against them. Even if you are up in a blimp about a thousand feet above the earth, on such a trip as the writer has in mind and which took place at Rockaway Beach about a year ago, you will be surprised, and not altogether pleasantly either, when on a clear day, with the giant gas bag floating lazily in the air, you almost have your feet fly up and shake hands with your face, for all of a sudden—woof!!! Old Mr. Blimp jumps diagonally—or was it vertically?—about fifty feet! No, fellow scientists, it was not magnetic or electrostatic attraction for another blimp which you perceive about one-half mile away, but simply the *irresistible force of the wind* exercising its full wallop against the vast hulking form of the blimp "gas bag."

Therefore, not only is the dirigible a tricky machine in high winds or storms, as was experienced countless times by Count Zeppelin, the erstwhile investigator of Zeppelin tactics when his giant cigar-shaped dirigibles 600 to 800 feet in length were destroyed one after another in storms, but they also have the disadvantage of *slower speed* as compared to the seaplanes, owing primarily to the greater bulk of the gas container or bag which has to be driven thru the air with a consequent great displacement thereof. When it comes to a forced landing on the sea, most aviators would undoubtedly rather take their chances with a seaplane of the Navy type, rather than with a dirigible of any size. For they may, if the weather is quite calm, land in a detachable life-boat carried by the dirigible and by means of a rope ladder descend into it while on the surface of the ocean. This, with the chances under ordinary conditions that they would have to make an attempt at lowering the altitude of the dirigible herself. In this case they would remain in the gondola attached underneath the dirigible, with the possibility that the "elephant of the air" would attempt to set down on them and smother them. At any rate it would require extremely skillful seamanship to carry out such a maneuver successfully. The question of fire in dirigibles has been made practically obsolete, in view of the fact that the U. S. War Department in the past few years has developed the new balloon gas "helium" to the stage where it is available at small cost, and this new gas is absolutely non-inflammable. Its lifting power is 85 per cent of that of hydrogen, the gas heretofore used in blimps and dirigibles, but which possesses the disadvantage of being inflammable.

Radio Equipment of the NC Seaplanes.

Details of the radio installation of the NC seaplanes engaged in the attempt to make the transatlantic flight, as given out by Acting Secretary Roosevelt of the Navy Department, follows:

The radio on the NC seaplanes involves two transmitters. One is a ½ K. W. spark transmitter, the main element of which is a streamline generator and accessory apparatus, which is driven by an air propeller and is mounted on the deck of the boat aft. This set weighs only forty-five pounds, but is used for the regular telegraph communications between the seaplanes and stations up to a distance of 250 nautical miles. Since this set is driven by a

A Comparison of Costs

A graphic picture of the high cost of doing business is shown by the rise in a long list of commodity prices during the past five strenuous years.

By the exercise of unparalleled economies, telephone rates have been kept almost unchanged.

The fact is, the increase in the cost of commodities has resulted in what is equal to a decrease in telephone rates. In other words: The dollar which was spent for the telephone has bought more than twice as much as the dollar spent for the commodity.

The activities of reconstruction which are now upon the nation have put a great burden upon the telephone. This condition has made necessary an advance in telephone rates.

This advance does not exceed an average of eight per cent; almost negligible as compared with the advances in other lines of industry, yet enough to cover the increase in the cost of operation.

Only through adequate revenue can there be assured the maintenance of a high standard of telephone service.

Have the Vitality of a Champion!

A champion must possess an exceptional and unusual amount of strength, endurance and vitality. The man with the most highly developed vitality is the man who wins. But you need not be a fighter to have all the qualities of strength, health and progressiveness of a real leader. I can show you how to make yourself a MAN. I can make you robust, develop your strength and give you an abundance of vitality and a highly developed Body and Mind.

EARLE LIEDERMAN

I have trained some of the world's strongest men. I can train you and give you a muscular development like mine above, perfect health, abundance of vitality, and great strength, as I have and as all my pupils have.

You don't wish to go through life hampered by a weak, sickly body. The man who makes a success in business is the man with energy and vitality.

I can give you these with the proper training. Your body will develop along the lines nature intended. You will notice immediately a new feeling of confidence and ambition taking hold of you—your skin will be cleaner, your eyes brighter, and instead of a despondent outlook on life, you will be filled with the unconquerable determination to win.

MY NEW BOOK

"Muscular Development"

tells how. Send 10c for it to-day. Use the coupon below. The book contains full particulars of my splendid offer, and is profusely illustrated with pictures of many of the world's strongest men whom I have trained. **Don't pass this by. Sit right down and fill in the coupon. Do it now, this minute while it is on your mind.**

propeller, it can only be used while seaplanes are in flight. The antenna used for this set is a single trailing wire leading from the tail of the boat for a distance of 250 feet down and to the rear. A streamline lead weight holds the lower end of this wire down.

With this transmitter it is possible for the commanding officer to send messages from time to time regarding the progress of the flight, to be retransmitted by the nearest shore station to the Navy Department. Also communication can be held with destroyers or other craft and radio compass signals or other information requested.

The other transmitter is a combined telephone and telegraph transmitter, and operates on a small 12-volt storage battery. It is used on an antenna consisting of wires permanently stretched on the skid fins on the upper planes so that it may be used while the seaplane is in flight or on the water.

The Anti-Noise Microphone.

It is this set which is used for telephoning between the 'planes, arrangement being made so that either the radio operators or the commanding officers themselves may communicate directly by telephone while the 'planes are in flight. Such interplane telephoning may be carried on up to a distance of twenty miles. While on the water this set may be used for telegraphing or telephoning a distance of about thirty miles.

A special feature of the telephone sets is the *anti-noise microphone,* which is so constructed that the engine noises are not heard. This is accomplisht by having the back of the microphone open. The exterior sound waves strike the back as hard as the face of the diafram, and therefore the effect is neutral. The voice waves strike only the face of the diafram, and even tho the operator cannot hear his own voice, the radio sets receive enough effect to modulate the transmitted wave.

This single item has been the deciding factor in success or failure in long-distance transmission by telephone by airplane. It is easy enough for short distances to get communication with an ordinary microphone, but for long ranges it is impossible without the anti-noise transmitter.

Radio Compass Installed.

One of the most important of the radio installations on these seaplanes is the radio compass. This consists of a set of revolving coils mounted in the tail of the machine, on which are mounted many turns of enameled copper wire. The radio waves are picked up on these coils by revolving the coils until the radio signals obtained on two methods of connection are of the same strength.

The operator then knows the direction of the incoming waves. By then reading the position of a pointer on a scale on the coils, the bearing of the transmitting radio station is determined. This bearing is then communicated by the radio operator to the navigating officer by means of the intercommunicating telephone, which consists of telephone receivers built into the helmets, and the same type of microphone used by the operator.

Using the same inter-communicating telephone system, the navigator can telephone to the pilots, giving them the proper direction in which to steer the 'plane. He may inquire of the engine room regarding the condition of the engines, or he may hold radio telephone conversation with the navigating officer on one of the other 'planes.

In other words, the inter-communicating telephone makes possible constant communication between all members of the crews in spite of the terrific noise caused by the engine and the wind rush, and in spite of the fact that they are located in separate parts of the seaplane. In addition to this the radio telephone makes it possible for the commanding officer and navigators to talk directly with each other, altho their seaplanes may be flying at a distance of 20 miles apart.

The radio compass signals may be received from a destroyer at a distance of 75 miles, or from large land stations at a distance of 600 miles.

The regular receiving apparatus on the seaplanes will permit of reception from land stations of high power at distances of several thousand miles, thereby permitting the seaplanes to copy weather reports or orders directly from the Navy Department at Washington.

The main striking fact regarding this radio equipment is that, completely installed, it weighs only 200 pounds.

Radio Reply in Three Minutes.

As an example of the efficacy of the seaplane's radio communication the following will serve:

The Navy Department communicated with the seaplane NC-4 after she started on her flight to Halifax, received a reply from Commander Read, and had broadcasted to Europe and the west coast of the United States the plane's position in *three minutes* elapsed time.

The message filed by the Navy Department at 11:18 A. M. was as follows:

> What is your position? All keenly interested in your progress. Good luck.
>
> (Signed) ROOSEVELT.

At 11:20 A. M. this answer was received:

> Thank you for good wishes. The NC-4 is twenty miles southwest of Seal Island, making eighty-five miles per hour.
>
> (Signed) READ.

At 11:21 A. M. the substance of Read's message was sent broadcast from the Annapolis (Md.) and New Brunswick (N. J.) radio stations, reaching Europe, South America, the west coast of the United States, and Honolulu. At 11:26 A. M. the radio stations at Balboa, Canal Zone, and San Diego, Cal., had confirmed receipt of the message.

New Navigation Instruments.

Three new and novel instruments for airship navigation have been invented and employed for the first time by the NC-1, NC-3 and NC-4 in the trans-Atlantic flight. They are an *aërial sextant,* a drift and *speed indicator,* and a *course and distance indicator.*

No airplane has ever flown far enough out to sea to warrant the use of the sun, moon and stars for fixing a geographical position, stated the Navy Department in announcing the use of these instruments. An instrument has been designed that will enable the air navigator to locate his position, regardless of the state of weather and regardless of the very fast speed of the airplane. An equal feature of the aërial sextant, known as the *Byrd sextant,* invented by Lieutenant Commander H. L. Byrd, is that a bubble in a tube takes the place of the sea horizon and observations. A specially constructed lens is used in sighting the bubble, which is reflected in a mirror. The sun is reflected in another mirror. The observer brings the sun tangent to a line at the same time he brings the bubble tangent to the line. That gives the altitude of the sun. This is of especial value, as the aviator is often above the clouds, and even when flying at low altitudes the horizon is too dim to be seen clearly. With this new aërial sextant the curvature of the earth does not have to be taken into consideration in calculating position. *The bubble is lighted at night, so that night observations may be taken.*

New Chart Saves Time.

New methods of astronomical calculations also have been devised which enable the navigator to make his calculations in a fifth of the time that was formerly neces-

BATTERY CHARGING Will Be Your BIGGEST MONEY-MAKER

Start NOW to charge auto storage batteries. No electrical or mechanical knowledge needed. All cars need batteries charged often. Get the business—sure, steady BIG PROFITS on very small investment with HB Battery Charging Equipment.

With an HB 500 Watt Charger You Can Clear $100 to $200 PROFIT Each Month

Easy to install, economical to operate. Recharges 1 to 7 6-volt batteries at once. Costs 10c to 15c each to recharge, customer pays 75c to $1.50 No burnouts or expensive renewals. Runs 24 hours every day. Requires almost no floor space. No attention needed save occasional oiling. Hundreds are building big, permanent business with HB Battery Charging. Why not YOU?

Small Investment Puts This HB Money-Maker in Your Garage or Shop

Balance on easy monthly terms. Outfit pays for itself. Absolute Money Back Guarantee. Don't delay. Start ***now*** to get those profits. Tear out this ad and mail ***today*** for full information. Let us help you succeed. Write to

sary. A projection chart of the Atlantic Ocean has been specially constructed for this purpose. This chart, a new invention, does away with difficult mathematical calculations, enabling the aviator to determine his position in a few minutes.

Another great problem of the sea-air navigator is the calculation of the speed and direction of the wind, both day and night. In spite of the reliability of the compass it can only give the course upon which the craft heads, and in determining the true course proper allowance must be made for the sidewise drift caused by the wind. For example, a wind blowing thirty miles an hour towards the side of the 'plane will blow it thirty miles an hour out of its course. This fact alone makes the navigation of the air far more difficult than the navigation of the sea.

To overcome this difficulty bombs have been invented which ignite upon striking the surface of the water and give a dense smoke and bright light for ten minutes. An instrument is used in conjunction with this bomb which enables the navigator to determine the velocity and direction of the wind by sighting on the smoke in the daytime and the lights at night. This instrument, *called the speed and drift indicator, has proved successful.* This instrument is illustrated in one of the accompanying photographs.

When the navigator has found the speed and direction of the wind, he must then be able to calculate the course to steer towards the Azores to allow for this wind. To do this an instrument has been designed to solve the triangle of forces, thus doing away with intricate mathematical calculations.

In the Navigator's Cockpit.

The navigator's cockpit is in the forepart of the boat and is equipt with a chart board, a chart rack and lights. He also has a specially designed headgear for telephone communication with the pilots, so that he can direct them when to change course. The noise from the four big motors is so great that it is impossible to hold conversation except with specially designed telephonic apparatus.

The navigator also has instruments which show him the altitude of the 'plane and the time the sun keeps with the Greenwich meridian, because in going to the eastward so rapidly it is difficult to keep the correct time. In going from Newfoundland to the Azores over two hours is lost in a period of twenty hours, so that the navigator must be very expert in order to allow for this loss in time in making his astronomical calculations. In aërial navigation positions must be determined very quickly. The navigator sits down to work out his "sights," to fix his position, and will be far from his calculated position unless he works out his calculations very rapidly, which these instruments enable him to do.

Ocean Station Ships Bear Numbers.

Each ship had her number painted in large letters upon her deck so that the fliers can tell at a glance just where they are and how far they have progrest, since the positions of the destroyers and battleships were fixt in advance, and on one of the many charts which the aërial navigators had before them these positions were carefully marked.

When the word was flasht by wireless from Trepassey that the NC's had started off the nearest destroyers put out great black smoke smudges which the commanders of the flying boats were able to see for many miles.

At night the guiding surface ships were grouped much closer together.

The vessels had their searchlights directed aloft, had their identification numbers on the decks illuminated. and from time to time threw up star-shells of the sort which the combatants in the late war used to illuminate no man's land.

Prepare Yourself For a Better Job!

No matter what kind of work you are doing, there's a better job with better pay waiting for you if you will prepare yourself to fill it. You get paid for what you do, and that depends on what you know; learn more and you will earn more.

You will get everything needed to put you in the big pay class from these great pay-raising books. They are written in plain everyday English by some of the world's greatest experts in each line, and we give a year's consulting service FREE with each set. Pick out the books that suit your own work best and mail the coupon for free examination today. See the free offer below.

MAKE YOURSELF A MAN

STRONGFORT The Perfect Man

You don't want to go through life a weak, ailing, sickly creature, pitied by your associates and ridiculed by women, because you haven't any of the elements of a virile, red-blooded MAN about you. *And you don't have to do it*—no matter what your present condition or what hrought you to it. You can get rid of the ailments or weaknesses that are keeping you down; you can free yourself from constipation, dyspepsia, or any other chronic disorders; you can strengthen your vital organs, every one of them; you can develop your muscles, add to your weight or take off your fat; you can get back your MANHOOD, with all it implies and be happy and successful in life, *if you go about it the right way.*

STRONGFORTISM

will show you how to do it, just as it already has shown thousands of other pitiable apologies for men, who put themselves under my care when they found that quack medicines and fake "remedies" weren't worth the bottles and boxes they were sold in. Strongfortism made them well and strong and vigorous again; it made me the strongest man in the world, and it will improve 100 per cent in a few short months ANY man who follows its principles. There isn't any doubt of it—I GUARANTEE results. You can't afford to pass up this chance of becoming what you want to be and what your wife wants you to do. Send for my *free book* **"Promotion and Conservation of Health; Strength and Mental Energy."** It will tell you how YOU can do what my pupils in every part of the world are doing every day. Send three 2c stamps to cover postage and packing and I will mail you a copy at once.

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of **15c** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth; now in its **26th** year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send **15c** to show that you might like such a paper, and we will send the Pathfinder on probation **13** weeks. The 15c does not repay us, but we are glad to invest in new friends. **The Pathfinder, Box 576, Washington, D. C.**

The NC's carried flares, which could be dropt to light up the surface of the water in case a landing became necessary at night, and their commanders had "rocket-pistols," which threw out balls of varicolored fire for signalling purposes.

Electric Self-Starters Used.

The Bureau of Steam Engineering was able materially to improve the performance of the boat by the application of new propellers, designed in that bureau. The NC-1 was originally fitted with standard navy low compression Liberty engines, which were found to be entirely satisfactory, but during the period that the NC-1 was being tested with these engines the Bureau of Steam Engineering, at the experimental laboratory at the Washington Navy Yard, perfected carbureter adjustments on the high compression Liberty engines which materially improved its economy.

Since the high compression engine gave greater power than the low compression engine, such engines replaced the original installation on the NC-1. With the new propellers and the new engines, the boat got out of the water and flew easily, with a total weight of 24,700 pounds. The designed load was 22,000. Besides providing propellers and engines for the boat, the Bureau of Steam Engineering supplied a remarkably efficient *electric self-starter* to each engine.

This style of self-starter weighed only 35 pounds, and by means of this improvement it was possible for the pilot to start any engine without leaving his seat. It is believed that this constitutes the first application of an electric self-starter to the Liberty engine.

Wing span from tip to tip, 126 feet.

Upper wing from tip to tip, 114 feet.

Aileron projections beyond wing tips, 6 feet on either side.

Lower wing span, 94 feet.

Width of wings, 12 feet.

Distance between wings, 14 feet at center and 12 feet at outer tips of lower wing.

Over-all length from front end to the rear end, 68 feet 3½ inches.

Length of hull, 44 feet 9 inches.

Wing area, 2,380 square feet.

Weight full load flying condition, 28,500 pounds.

Weight carried per square foot of wing surface, 12 pounds.

Estimated speed at full load, 79 nautical miles per hour.

Estimated speed at light load, 84 nautical miles per hour.

Horsepower of four Liberty engines, 1,600 horsepower.

SAWING A 74,000-Lb. STEEL INGOT.

(*Continued from page 208*)

It is an interesting fact that in cutting steel beams and ingots with these cold saws that *the saw proper never touches the steel* or iron stock; the cutting is done by a film or layer of comprest air just in front of the teeth. This comprest air layer is formed due to the high velocity of the saw blade, which is often several thousand revolutions per minute.

Some most interesting tests were recently made with these inserted tooth saws under regular working conditions. A 24-inch diameter blade cutting rails, peripheral speed 51 feet, lateral feed 27/32 inch per minute showed, before sharpening, a total of 424 cuts; after sharpening, a total of 502 cuts.

In an endurance test of a 40-inch saw with the lateral feeds on .45 carbon machinery steel, 12-inch round stock was cut in 5 minutes and 9-inch round stock cut in 35 seconds. The lateral feed guaranteed in the latter case was 2 inches per minute.

—*By Frank C. Perkins.*

Practical Chemical Experiments

By Albert W. Wilsdon

(Continued from page 220)

with Turpentine, Benzine, Naptha, or Gasoline, but old paint spots must be softened with oil or grease, and may then be removed by the appropriate solvent. Pitch, tar, or varnish may be treated with oil, and then be dissolved out with turpentine.

Sugar spots are soluble in warm water. If acids have destroyed the color of the goods, this may usually be restored by ammonia, and dilute alcohol may be used in the same way for the stains from fruits.

Removing Ink Stains.

It would be a much simpler task to remove ink spots if we only knew the composition of the ink in advance. Fresh ink usually dissolves in cold water, tho sometimes sour milk is more efficient. Ink stains may also be removed with blotting paper or some other absorbent. On marble, these stains may be treated with turpentine, baking soda, or strong alkalies, or a paste may be made with the alkali and turpentine, and this may be left for some time in contact with the spot, and finally washed off with water. A dilute solution of oxalic acid may often be used successfully to remove either ink stains or iron rust spots.

If there is much iron in the water supply, this may be removed from bowls or other porcelain ware by the use of hydrochloric acid, then rinse with water, and finally with a solution of soda.

It has probably often been noticed that silver is readily tarnished by sulfur, either from eggs, or from rubber bands or elastic, or sometimes from the sulfur compounds in the illuminating gas. The sulfid of silver thus formed is in color from grayish to black. Silver thus tarnished should be rubbed with moist common salt before washing, thus forming a chorid of silver, which may then be washed in ammonia, in which it is soluble.

For cleaning and polishing brass and copper, nothing is better than oil and rotten-stone, and most of the good polishes on the market are made from these materials, with alcohol, turpentine, or soap. Kerosene is useful in keeping metals bright, as well as glass and wood. Aluminum may be cleaned by the use of whiting or any silver polish, but alkalies should not be used upon this metal. As aluminum does not tarnish readily, and does not rust, it is an ideal substance from which cooking utensils are made.

Iron-Rust Stains.

To remove an iron-rust spot from a piece of goods, stretch the cloth over a dish containing hot water, then as the steam arises and the goods become moist, drop a little hydrochloric acid upon the rust spot with a medicine dropper. See Fig. 3. After a moment or two lower it into the water. If the spot is not removed, repeat the operation, then rinse in clear water, and finally in a dilute solution of ammonia to neutralize any acid that might remain and injure the goods.

Iron-rust stains may often be completely removed from delicate fabrics by the use of lemon juice and common salt.

QUESTIONS AND ANSWERS

Detecting Saccharine.

Q. 10. Werner Kretschmer, of Demarest, N. J., wants to know:

(1) The test for Saccharine, and (2) Method of detecting Glycerine in foodstuffs. (3) If the "Fuller's Earth" method of testing butter for coal-tar dyes can be applied to foodstuffs.

A. 1. Saccharine is a very sweet substance prepared from coal-tar, and has been used largely for sweetening purposes in the place of sugar. It also possesses some preservative power, but is never used

Make a Bigger Income Learn Draftsmanship

Great demand for draftsmen now. Still greater demand in prospect. War over, building is to be resumed and manufacturing to expand to meet home and foreign needs—which means plenty of good positions for draftsmen. Take up this paying profession. The Chicago "Tech" method is the quickest, easiest way to become a draftsman in spare time while you hold your present position. That proved before you pay a penny. (See free lesson offer below.) Send coupon. Learn how to earn

$25 to $100 a Week or More

at interesting work with opportunities to rise to superintendent, manager, or other executive positions. Let the Chicago "Tech" engineers train you At least get the free lesson and information.

Drawing Outfit

(No Extra Charge)

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives this drawing outfit—set of instruments in case, drawing board, T square, triangles, scale, curve, drawing paper, pencils, etc., or a cash credit in case he already has an outfit. You use them while learning.—then take them right into your practical work.

NOTE: Enrolled with Chicago "Tech" you have the personal direction of practical engineers, builders and architects who teach you the methods they use in their own work. No useless theories, no time wasted. You are prepared to stand beside old, experienced men. Big advantage to learn from a staff like this—every man a specialist.

Come To the College or TRAIN at HOME

Wherever you are you can have this Chicago "Tech" training. Complete instruction by mail. Exercises, lessons, personal direction of our experts right in your own home if you cannot come to the college for a resident course. Send the coupon and get the facts.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now.

Learn All This in Spare Time

All about the Principles of the Automobile.
All about Gasoline Engines.
All about Power Plants and Transmissions.
All about Carburetors and Fuel Supply Systems.
All about Lubrication and Cooling.
All about Batteries.
All about Magneto Ignition.
All about Starting and Lighting Systems.

Know How To Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.

Write Send the coupon and get catalog and all information now.

Easy Payments

The fees for Chicago "Tech" courses are very moderate—and you can pay on easy terms. And also—you can obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course.

FREE TEST LESSON

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man. The coupon will bring all the facts about the course, the small fee, and the easy terms.

Mark with X the branch you are interested in--or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or the letter today.

CHICAGO TECHNICAL COLLEGE,
745 Chicago "Tech" Building, Chicago

Without obligation upon me, send your Catalog on subject indicated below. Also FREE Lesson if inquiry is on Drafting or Plan Reading. Mark X opposite work in which you are especially interested.

Mechanical Engineering

Learn at Home!

EMPLOYERS everywhere are looking for men with mechanical ability. Splendid salaries and rapid advancement are offered.

There is an easy, delightful way in which you can learn right at home in spare time. For 27 years the International Correspondence Schools have been giving men and women just the training they need for success in mechanical engineering and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6194, SCRANTON, PA.

Explain, without obligating me, how I can qualify for the position, or in the subject, before which I mark X.

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed **Norway Iron Core Wire** and are selling this wire to "Experimenter" readers

At Pre-war Prices, 20cts. lb.

This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire.

We have only one size left:
24 INCHES LONG.
Thickness about No. 21 B and S

If this size should be too long we advise cutting the wire down yourself by means of shears.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound.. Add postage or we will ship express collect. Order at once.

Electro Importing Co., 231 Fulton St., N.Y.C.

solely for this purpose, the preserving influence being only incidental. In the detection of saccharine the substance containing it, which is usually a liquid, is shaken with chloroform, which settles to the bottom and is removed by means of a medicine-dropper. The saccharine enters into solution with the chloroform while sugar if present does not. The chloroform solution is then evaporated by heating gently on the water bath, and if saccharine has been present the residue has a distinctly *sweet* taste. This method is not applicable to substances whose chloroform layer contains a flavor that would mask the sweet taste of the saccharine, for instance, ginger ale.

(2) You fail to state what foodstuffs you desire to test for the presence of glycerine. It is essential that this be given as the methods of procedure to test for this substance is too varied to give a condensed test which would be applicable to all foodstuffs.

(3) The Fuller's Earth test which you mention may be used for the detection of coal tar dyes in foodstuffs other than butter.

MUSTARD GAS

Q. 11. Clayton Doolin, of Decatur, Ill., desires information regarding "Mustard Gas" and how it is obtained.

A. Mustard Gas is obtained by volatilizing Mustard Oil (Allyl Isothiocyanate). This is prepared by distilling macerated black mustard seeds with steam. Mustard seeds contain a glucoside "potassium myronate," which is soluble in water; its solution gradually undergoes fermentation (owing to the presence of an enzyme, "myrosin"), mustard oil, glucose and potassium hydrogen sulfate being produced. Allyl Isothiocyanate may be obtained synthetically by heating Allyl Iodid with Potassium Thiocyanate; it forms a liquid slightly soluble in water, of irritating odor, inciting to tears and producing blisters upon the skin.

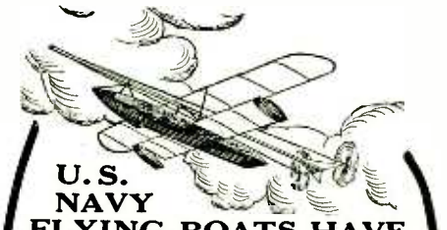
ATMOSPHERIC NITROGEN

Q. 12. James G. Peck, Elmira, N. Y., has heard that a mixture of Nitrogen and Oxygen, when subjected to a succession of electric sparks will form *Nitric Oxid*. He wants to know if the same result will be obtained by using a mixture of the two gases as they occur in the air; in other words, by subjecting ordinary air to a powerful electric discharge in an enclosed chamber.

A. The subjecting of Atmospheric Nitrogen to a succession of electric discharges is at the present time successfully operated, for the formation of Nitric acid and Nitrates. Fig. 4 depicts the Birkeland and Eyde furnace of a later type. The individual furnace may be described as a low, wide cylinder resting upon its side and placed between the arms of an enormous horseshoe magnet. The cylinder is made of heavy iron plate and consists of similar halves, which are bolted together. The interior is lined with refractory brick, so arranged that in the middle there is a narrow circular chamber, over 6.5 feet in diameter and about 3.9 inches in width. In this circumscribed space the reaction takes place. The huge terminal poles of the wrought iron electro-magnet, beveled at the extremes, are embedded in the chamotte lining, and are about 9.8 inches apart, their axes corresponding with that of the chamber. The electrodes are of copper, with internal circulation of water, and are .59 inch in diameter. They enter the chamber from opposite sides. and are separated from each other at its center by an interval of about .31496 inch. Air under pressure is admitted to passages between the external shell and the chamotte lining, and enters thru numerous small inlets in the latter, into the reaction chamber. The gaseous current issues, thru openings in the periphery of the chamber, into a conduit which leads to the absorption apparatus. A small

Adventures of the Auto-Wheel Coaster Club

"The Free Caps Arrive"



"We formed the Club last week. The caps came today and they're real class—racy looking, like the Auto-Wheel Jim's is a special one, because he's captain.

"Any kid who has an Auto-Wheel Coaster or an Auto-Wheel Convertible Roadster can join, and get one of these caps.

"We've planned several 'stunts' for this summer—things we can do with our Auto-Wheels."

BOYS—The Auto-Wheel is ***the wagon.*** Two styles: Coaster and Convertible Roadster as shown above. Color Catalog and Felt Pennant free for the names of coaster wagon dealers, telling which one handles Auto-Wheel.

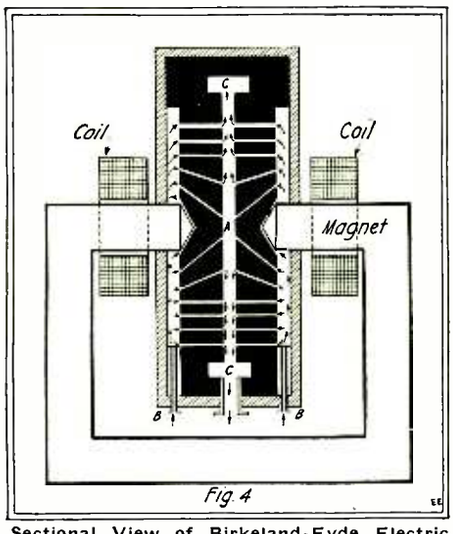
Shorthand—for busy people, including YOU. Proof Lessons, Guarantee and Brochure with Testimonials free, postpaid. Address: KING INSTITUTE, EL 300, Station F, NEW YORK CITY

window of mica in the front of the furnace allows inspection of the operation. A direct current feeds the coils of the big magnet located immediately outside the iron shell, and an alternating current is connected with the electrodes. This current is one of 5,000 volts, 50 cycles to the second. The most striking features of such a furnace are its simplicity and its durability. There are no movable parts. When in uninterrupted operation the electrodes are changed every three or four weeks, while the refractory lining is removed once or twice a year. Repairs are easy to make.



When in operation, a glance thru the window reveals the intensity of the reaction going on at a temperature of over 3,000° C. The result of the process is measured by the percentage of nitric oxid contained in the air issuing from the furnace.

Chemically, the reaction in the furnace between the oxygen and the nitrogen of the air is represented by the equation

$$N_2 + O_2 = 2NO$$

That is, one molecule of oxygen unites with one molecule of nitrogen to form two molecules of nitric oxid, a colorless gas.

The nitric oxid unites readily with free oxygen, at temperatures below 620° C., to form nitrogen peroxid, a brown gas, with the formula NO_2, at temperatures above

Sectional View of Birkeland-Eyde Electric Furnace Used in Fixation of Atmospheric Nitrogen.

140° C., and the formula N_2O_4, at low temperatures. The peroxid condenses at 22° C. to a liquid which at —30° C. congeals to a mass of colorless crystals. As the temperature falls from 140° C. the number of molecules of N_2O_4 in a given volume steadily increases, as shown by the increase in density and the change in color from a deep brown to a reddish brown, and then to a yellowish brown. At 60° C. half of the molecules in the gas are of the formula N_2O_4. At 28°C. they constitute 80 per cent.

When the peroxid comes in contact with water it is dissolved and reacts, forming nitric acid and nitrous acid, thus:

$$2NO_2 + H_2O = HNO_3 + HNO_2$$

With an excess of peroxid the nitrous acid is oxidized to nitric acid and nitric oxid is liberated:

$$NO_2 + HNO_2 = NO + HNO_3$$

The net result of these two reactions is that two-thirds of the nitrogen peroxid is transformed into nitric acid, according to the equation:

$$3NO_2 + H_2O = 2HNO_3 + NO$$

The liberated nitric oxid, in the presence of oxygen and water, repeats the cycle of changes given above, so that theoretically it is possible to change to nitric all the nitrous oxid in the current of gas issuing from the nitrate furnace.

This Is the School
Where Practical, Applied
ELECTRICITY

Is taught in all its phases, quickly and thoroughly. The faculty of Electrical Engineers and Practical Experts will enable you to

Become an Electrician Here in One Year
Or Learn an Electrical Trade in 6 Months

Laws and principles of electricity,—together with practical lectures and problems, actual training in laboratory work and electrical machine departments embracing design, assembling and operating of motors and testing apparatus of all kinds,—all these broad facilities and thorough methods of instruction prepare you to become an expert Electrician in one year, or, in six months to master one of the Electrical Trades.

Success and rapid advancement in the great electrical field will result from your training at this school. Determination and ambition are the chief requisites for entrance. Clip the coupon below and mail it NOW, for complete details and illustrated catalog.

"Earn While You Learn" if you so desire. We will secure part-time employment that will give you actual shop experience and at the same time help defray your living expenses. No interference with school hours. Our catalog explains in detail. The coupon will bring it to you.

THE MIDGET SLIDE RULE will solve any problem in addition, subtraction, multiplication, division and proportion. A Log-Log Scale gives any root or power of any quantity. Gives Logarithms, Sines, Tangents, Cosines, Cotangents and the decimal equivalents of fractions to six figures. It is grease and water proof and will give years of service. This rule is not to be compared with the paper utility rules which sell for $1.00 and are put together with paper fasteners. It is accurate, simple to operate and comparison shows that it is undoubtedly the fastest and most complete rule made. Our refund guarantee protects you from loss or disappointment. An instruction book 16 pages, 12 illustrations, is sent with each rule. Diameter of rule 4 in. Made in two models: Metal (white coated steel), $1.00; White Celluloid, $1.25. Leather Case 50c extra. Send for catalogue of Slide Rules. Your money back if you are not satisfied. **Gilson Slide Rule Co., Niles, Mich.**

Send To-day for the "Electrical Worker's Friend"

(*Continued from page 230*)

principle an insulated, two-pole circular switch for controlling 16 gap units. It permits the quenched discharge to take place between any number of gaps from 1 to 16, but allows the group of gaps used to be selected at any available part of the series of gaps, and shifted by the simple rotation of two hand wheels at once, as a unit. Each gap unit is air-tight, self-contained, and may be renewed independently of the rest by hand. The circuit is automatically and instantly closed after the break made by removal. Each gap is mounted in a vertical plane, in two horizontal rows of eight gaps each. Each gap unit consists of two brass discs with highly polished silver annular rings which are soldered to the discs. They are separated by fish-paper gaskets, each gap being set to spark at 1000 volts. One of the most important pieces of apparatus on the panel is the coupler and wave changer, consisting of a fixt primary coil and movable secondary coil. They are designed to have corresponding turns as tuning points in each, making simultaneous contacts with two rotating selector arms.

The three openings at the left-hand side of the coupler in Fig. 1 show the wave lengths, the correct wave length being read only at the center or bottom opening.

The thermo ammeter is used in connection with the Weston shunt-block, one end being grounded to the panel frame. It reads from 0 to 15 amperes.

From actual operating tests at full power, this set will radiate from 15 to 18 amperes antenna curent and has a daylight transmitting range of approximately 1000 miles, under normal conditions.—*Photos courtesy Emil J. Simon.*

Hook-Up of New Simon Quenched Gap Panel Transmitter. This Set Is Extensively Used in Naval and Commercial Ship Stations as Well as Land Stations.

AN ELECTRIC SHOOTING GALLERY

(*Continued from page 222*)

rection of rotation, thus hauling the target carrier to the rear of the range. Of course, behind the target there may be arranged the usual plank in which the bullets can imbed themselves. A piece of two-inch plank is very serviceable for the purpose, and where there is the least danger of any one passing behind the partition or behind the targets, the planking should be made about five feet high and three to four feet wide, and this in turn backed up by 1/16 to ⅛ inch steel sheeting.

Where hard-shooting pistols or rifles are used, it sometimes becomes necessary to back up a plank target such as this, backed with a wall of sand about 2 to 3 feet thick. —*Photo courtesy General Electric Co.*

GENERAL SQUIER WINS FRANKLIN MEDAL.

At a meeting of the Franklin Institute held on Wednesday, May 21, Major General George Owen Squier, Ph.D., Chief Signal Officer of the U. S. Army, was presented by the Institute with the Franklin Medal for important work which he has done during the war in the Signal Corps Branch of the Army.

In addition to this a Franklin Medal was also presented to Major General James Douglas McLachlan on behalf of His Britannic Majesty's Government for Sir James Dewar, Jacksonian Professor of Experimental Philosophy, University of Cambridge; Fullerian Professor of Chemistry, Royal Institution, London, for important work which he had done for the British Government in the World War.

"I Would Not Part with it for $10,000"

SPECIAL KON-VER-TER SLIDE RULE

The Hamilton Improved circular slide rule has over 8000 graduations and over 1800 figures and letters on it, and is an engineer's hand book and slide rule combined. It is 5.4 inches in diameter.

It will subtract, divide, multiply and add fractions or decimals of an inch, can be used as a decimal equivalent table, constructed of three disks and double transparent celluloid rider. Decimal equivalents given to six places in figures, gives sines, co-sines tangents, co-tangents, secants, co-secants versed sines, co-versed sines, square, cube and fifth roots with all their powers, finds the area, circumference and diameter of circles directly.

The Log scale has 1000 graduations. The DE LUXE rule may be bent double without injury, try this with rigid material such as metal. Has no clumsy operating attachments and will work proportions.

The KON-VER-TER is artistic as well as useful. In use all over the U.S., Canada, Mexico, Cuba, Porto Rico, Panama, Bermuda, Hawaii, Philippines, Australia and New Zealand. Instructions with rule.

Beautiful gold embossed black leatherette case, 50c extra. PLAIN UTILITY RULES $1.00. SPECIAL DE LUXE RULES white ivory celluloid $2.50 P.P.

A 100 Horse-Power Voice

(*Continued from page 212*)

speaker. Each afternoon the Navy Department at Washington sends by wireless the correct time to ships at sea. This message was picked up on several occasions and transmitted to the crowd at the "Way."

The loud speaker equipment employed at the "Way" was the same as that used aboard ships of the U. S. Navy during the war to make orders heard in every part of the ship.

The speakers' stand at "Victory Way" was in the center of the "Way." On this stand there was a small and extremely sensitive transmitter—so sensitive that it was not necessary for the orator to talk into it. It comprised a battery of three microphones. He merely talked in front of it, and the sensitive transmitter carried the electric current, whose variations represented his enunciations to the control room at the rear of the speakers' stand. There the amplification apparatus boosted the sound waves 7,500,000,000 times and shot it out to the *loud speaker* receivers, *one hundred and twelve* of which were strung above the heads of the audience, twenty feet apart, up and down the whole length of the "Way." The amplifiers comprised a large number of Audions or so-called *talking bottles.* These receivers were very sensitive telephone receivers of special design, with large megaphones or horns, to make the speech audible to those standing below. The area covered by the loud talkers was about 60,000 square feet.

The transmission of the speech from Washington, however, involved much more. The speakers at the National Capitol used a special telephone set and, of course, they also had a *loud speaker* receiver, so that they might hear the applause from New York.

In the case of the message from the Dirigible C-4, the transmitter on the speakers' platform was connected, not only with the loud speaker receiver, but with wireless as well, which transmitted waves to the radiophone aboard the dirigible.

The antennae for the radiophone communication were stretched between the Hotel Avignon and the Railroad Y. M. C. A. Building, which are on opposite sides of "Victory Way," with a wireless apparatus in the latter building, from which the messages were wired to the control room and the loud speaker circuits.

The control room was elaborate and contained a mass of wires and switches and special electrical devices, developed by engineers of the Bell Telephone System. This room contained the amplification apparatus, means for generating the electric current use, and switching devices used for connecting with the long distance wires to Washington and the wireless.

Electric locomotives past beneath the street in the tunnel of the New York Central Railroad. To avoid electrical disturbances from these, the control room was completely covered with sheet iron, which was grounded, so that the control room was isolated electrically. Also the amplifier bulb cabinets were suspended from the ceiling on rubber cords.

No loud speaker receivers were placed within eighty feet of the speaker on the platform, because in that case the speaker's voice, as it came from his throat, and as it poured down thru the loud speaker receivers, would play a race in which the sounds from the receivers would reach the auditor first, because of the fact that electrical waves travel at a far greater rate of speed than mere sound waves. If loud speaker receivers were near the orator, the result would be a bedlam of sound, as the words overlapt one another.

BOYS

Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you.* Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6193, SCRANTON, PA.

Explain, without obligating me, how I can qualify for the position, or in the subject, *before* which I mark X.

158 Genuine Foreign Stamps—Mexican War Issues, Venezuela, Salvador and India Service, Guatemala, China, etc., only **10c.** 100 all diff., fine, 15c; 200 all diff., 25c. FINEST APPROVAL SHEETS 60% to 80%. AGENTS WANTED. Big 72-page Lists FREE! We Buy Stamps. Est. 25 years. C. E. HUSSMAN STAMP CO. Dept. 67 ST. LOUIS, MO.

FOR EXPERIMENTERS ONLY!!

WE have in the past held many extraordinary sales, but we believe that the present one eclipses all by the wonderful values we are offering. The goods which we offer on this page are all standard telephone apparatus. Every piece we are offering is equipment that for one reason or another was discontinued by the telephone companies. If you wanted to buy any of the pieces which we offer herewith, from the manufacturers, the price would at least be ten times what we are asking for it. You can readily ascertain this for yourself by looking over our wonderful prices.

RUSH

Cut out and attach to your order. It will leave us within 24 Hours.

We have bought a large block of these goods and have a large quantity of every item on hand. Immediate shipment can be made on all of the goods in practically any quantity within reason. *Shipment within twenty-four hours* will be made if you use the adjoining coupon. This coupon saves you several days and your order will then be considered a rush order. We guarantee every piece to be as represented, and we will refund the money if goods are not exactly as claimed by us.

No. 1 TELEPHONE RELAY. 1500 ohms—has two silver-contact springs and is very sensitive. Can be used wherever a sensitive relay is needed. It is adjustable and can be used for a variety of purposes.
No. 1 Relay—shipping weight, 2 lbs. Price..... **$1.50**

NO. 2 STANDARD TELEPHONE Induction Coil, primary 1 ohm, secondary 55 ohms. Used wherever you need a good induction coil. Has primary and secondary and iron wire core; fibre heads.
No. 2 Induction Coil as described—shipping weight, 2 lbs. Price..... **$0.50**

NO. 3 STANDARD RESISTANCE wound with German silver wire—4,500 ohms, can be used as a choke or plain resistance, and has many other uses that readily suggest themselves to the experimenter.
No. 3 Standard Resistance as described—shipping weight, 4 oz. Price..... **$0.40**

NO. 4 HORSESHOE MAGNET, size 3¼ inches wide x 5 inches high. Will lift about 1 lb. Quality such as used on magnetos, which means the best.
No. 4 Horseshoe Magnet — shipping weight, 2 lbs. Price..... **$0.30**

NO. 5 REPEATING COIL (Transformer). This is a standard small repeating coil and is used by all telephone companies. It has 4 different windings and eight contacts. Entirely enclosed in iron. The resistance being respectively 72 and 120 ohms, and 90 and 100 ohms. Diagram is furnished. Can be used for wireless, for boosting signals, etc.
No. 5 Repeating Coil—shipping weight, 2 lbs. Price..... **$0.50**

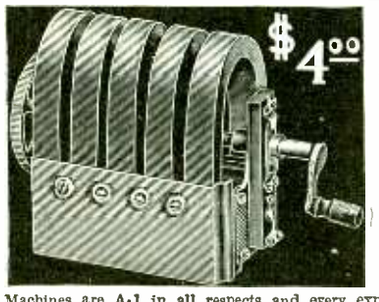
NO. 6 ½ M.F. CONDENSER. This is a standard telephone condenser and has ½ microfarads. Condenser comes in neat metal casing. This condenser is used in connection with spark coils to absorb the vibrator spark. Invaluable for test buzzers to absorb spark and make the sound of buzzer more steady. Is also used by every experimenter in connection with wireless where a fixed capacity is needed. Several of these condensers should be in every experimenter's laboratory.
No. 6 Condenser, ½ M.F.—shipping weight, 1 lb. Price..... **$0.50**

NO. 7 DOUBLE POLE BELL TELEPHONE RECEIVER—hard rubber casing with 4 ft. cord and tips. Standard 75 ohms—very powerful magnets. This receiver can be used in connection with any ordinary telephone work, and you will even find it sensitive enough for short distance wireless work.
No. 7 Bell Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.80**

NO. 8 STANDARD TELEPHONE RECEIVER with Metal Head. This receiver is made by Stromberg Carlson Co., with genuine hard rubber handle and ear cap. A very good fool-proof as well as sensitive receiver that cannot be put out of order if you try. Used for the same purpose as No. 7 Telephone Receiver.
No. 8 Standard Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.75**

No. 9 IMPEDANCE COIL (Close Core Transformer). This is a very fine little transformer and is used extensively in connection with telephone work. It is in reality an A.C. transformer for which you would pay $5.00 if you had it made to order. The primary has 0.15 ohms, secondary 2000 ohms. It can be used for a variety of purposes that will suggest themselves to every experimenter. Can be used successfully to boost wireless signals. Also in connection with audions, etc. An A-1 instrument. Size 3 x 3 inches.
No. 9 Impedance Coil—shipping weight, 2 lbs. Price..... **$0.65**

NO. 10 MICROPHONE AND BRACKET. An A-1 sensitive microphone of the carbon grain type. Has hard rubber mouthpiece and enamel steel bracket, the instrument being 10 inches long. This microphone, in connection with our No. 7 or 8 Receiver, will constitute a complete telephone outfit, good to speak 50 miles or more, at a remarkably low price.
No. 10 Microphone and Bracket—shipping weight, 5 lbs. Price..... **$1.00**



NO. 11 REPEATING COIL (Transformer). A standard repeating coil used for telephonic work. The coil windings are encased in an iron tube 2¼ inches in diameter. There are eight terminals for the four windings to connect to and the instrument is invaluable in connection with radio work to boost up signals, audion work, etc. Many interesting uses will be found for this coil. Resistances are: 100, 120, 145, 175 ohms.
No. 11 Repeating Coil—shipping weight, 8 lbs. Price..... **$2.00**

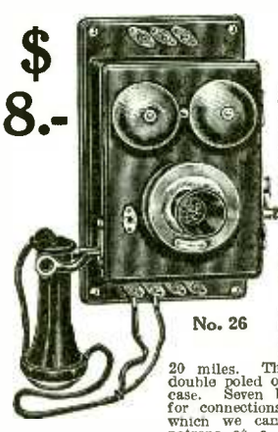
NO. 12 POLARIZED RINGER with Bells. The resistance of the two coils is 1250 ohms each. The armature is perfectly adjustable. Bell will work on any magneto. We also furnish blue print with ringer showing how *a first class polarized relay* can be made by anyone using only a few pieces of metal and screws.
No. 12 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.50**

NO. 13 POLARIZED RINGER with Bells. This is the same kind of ringer as the No. 12, except that it is not adjustable and that the resistance is less. First class in all respects. Blue print furnished with this to *make polarized relay* same as with No. 12. Solenoids on this ringer are worth more than the price we ask for the entire ringer, and do not forget a powerful magnet that goes with it.
No. 13 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.00**

NO. 14 HARMONIC RINGER. This ringer is also polarized and has a powerful magnet. It works on 66.6 cycles and any magneto will operate it if run at a certain speed. A very finely built instrument. Resistance of each coil being 200 ohms. Can be converted into a polarized relay by substituting a very fine leaf spring instead of the heavy one furnished. A most interesting instrument with which to experiment.
No. 14 Harmonic Ringer — shipping weight, 4 lbs. Price..... **$1.60**

NO. 15 RINGER without Bells—630 ohms. This also is a polarized ringer and has an adjustable armature. The adjustment is done by means of the top screw. A beautiful little instrument. With this instrument, too, we furnish a blue print showing how a *polarized relay can be built.* You should have several of these beautiful little instruments. They are worth their weight in gold; the powerful magnet alone being worth more than the price we ask for the entire instrument.
No. 15 Ringer—shipping weight, 2 lbs. Price..... **$0.80**

No. 55 5-bar magneto, 110 Volt A. C. Generator



This is one of the most powerful magnetos ever built, when manufacturers could afford to put good stuff into them; equipt with transmission, make and break, etc. Transmission wheels are all brass, crank handle furnished. This magneto, as well as the other ones listed below, will light a 110-volt lamp merely by turning the crank handle slowly. While this magneto gives alternating current only, it can be rewound so it will light up a number of four, six and 10-volt lamps, all depending upon the thickness of the wire you wind on the armature. As we furnish these magnetos, they will give a powerful alternating current and you will not be able to stand the current when grasping hold of the terminals. This makes an ideal shocking machine. All our generators can be transformed into a direct current machine by equipping it with a home-made commutator. Machines are A-1 in all respects and every experimenter should have one of them in his shop. Many other experiments which can be performed with this machine will readily suggest themselves to any experimenter. The magnets furnished with these generators are very powerful, each one being able to lift one pound easily.

NO. 55 5-BAR MAGNETO GENERATOR as described—shipping weight, 25 lbs. Price..... **$4.00**

NO. 33 3-BAR GENERATOR, same as described above except that it has only 3 bars, and is somewhat smaller.
No. 33 3-bar Generator—shipping weight, 10 lbs. Price..... **$2.00**

NO. 44 4-BAR GENERATOR, same as No. 55 except that it has 4 bars, and is somewhat smaller.
No. 44 4-bar Generator—shipping weight, 15 lbs. Price..... **$3.00**

NO. 66 6-BAR GENERATOR, same as No. 55 except that it has one more magnet and the armature is somewhat larger and more powerful. This is the biggest type made and is extremely powerful.
No. 66 6-bar Generator—shipping weight, 30 lbs. Price..... **$4.50**

Complete Wall Set

This is a complete commercial telephone station. The cabinet is of polished oak, piano finish, within which is contained the powerful magneto, the 300 Ohm polarized ringer, and induction coil. The magneto is exceptionally efficient, being of the two bar type with brass gear transmission. The extra sensitive microphone, mouthpiece and two gongs are mounted on the front of the cabinet, giving the entire instrument that desirable appearance of compactness and efficiency. Guaranteed to work over 20 miles. The telephone receiver is a double poled one, and has a hard rubber case. Seven binding posts are provided for connections. The instrument is one which we can offer with pride to our patrons at a ridiculously low price. It is unobtainable anywhere else at less than $15.00 and is an instrument unequaled in value for the price we ask. Size over all 11" x 10" x 8". Shipping weight, 15 lbs.
No. 26 Long Distance Telephone Set..... $8.00

ELECTRO IMPORTING COMPANY

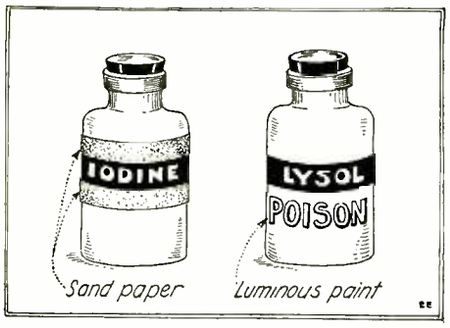
Our big, new electrical cyclopedia No. 20 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 176 Big Pages, 400 illustrations, 300 instruments and apparatus, etc. Big "Treatise on Wireless Telegraphy." 20 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. FREE Cyclopedia No. 20 measure 7x5¼". Weight ½ lb. Beautiful stiff covers.

ELECTRO IMPORTING CO., 231 Fulton Street NEW YORK

CARBON GRAIN TRANSMITTER



A special design of transmitter for long distance work. Is used on wireless telephone sets where a steady current of ¾ to 1 ampere is constantly required. Sizes over all 3¼ x 2½ inches. Shipping weight, 3 lbs. **No. 6080 Carbon Grain Transmitter as described..... $1.00**

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries addrest to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Safeguard Against Taking Poison In the Dark Unknowingly, Comprising Luminous Letters and Sandpaper Ring Around the Bottle.

Safeguard for Poison Bottles.

(327) Floyd Hoskins, Pine Bluff, Ark., writes: "Many people have killed themselves with poisons taken in a dark room by mistaking them for medicine bottles. I have an idea to safeguard the bottles by putting sand paper around them as per illustration. I also think that by having the word 'Poison' placed upon the bottle by means of illuminated paint, this would be an additional safeguard. Are these ideas patentable?"

A. The sand paper idea is quite an old one which has been described in the technical press many times. Sand paper has also been placed on stoppers as a safeguard. The idea of using illuminated paint, however, is new as far as we are aware, but we doubt very much if a patent can be obtained upon it. Applying luminous paint to various articles does not make a patentable combination so far as we know. It would be a good idea to get in touch with a patent attorney.

Electric Clock.

(328) Ernest Bostwick, Louisa, Ky., says: "Please advise me whether or not you think I could obtain a patent on a clock driven by electricity register hours, days, months and years."

A. Without having the details it is impossible to state if a patent could be obtained. There are at the present time a good many clocks in existence which indicate seconds, minutes, hours, months as well as the year. Unless you have a fundamentally new device, we doubt very much if a patent can be obtained.

Aerial Torpedo.

(329) E. F. Prucha, Howells, Nebr., wants to know if his idea on an aërial torpedo and aërial bomber and navigator which he has submitted with many illustrations and drawings is patentable.

A. After carefully looking over the drawings, we have come to the conclusion that there is nothing new involved in this invention, nor do we think it is practical. There are several features shown which may be patentable, but we doubt the practicability of the invention.

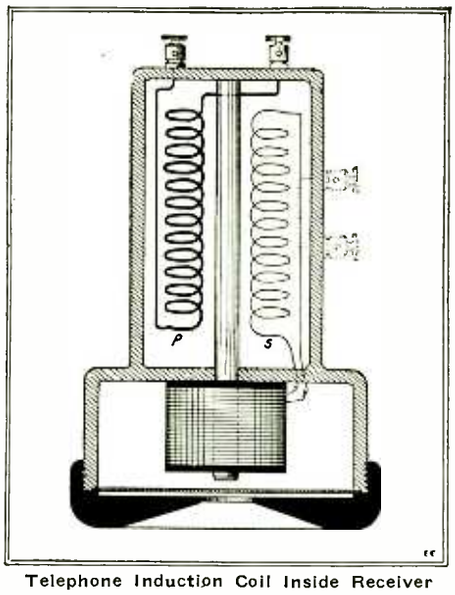
Demountable Rim Tool.

(330) S. W. Snelling, Newark, Ohio, has to say the following: "I have a little device that I think would be fine for automobilists. With this tool, you can take off and put on the demountable rim more quickly than it could be done today."

A. This seems to be a very good idea, and there also seems to be a good market for a tool of this kind. We think a patent can be obtained.

IN OUR NEXT ISSUE:

"How to Develop Your Inventive Ability" By Jay G. Hobson. Author of "How to Finance and Manufacture a Patent," publisht in our June, 1919, issue.



Nicotine Absorber.

(331) Philip Dubilier, New York, N. Y. submits sketch of a new device for cigarette holders which absorbs the nicotine of cigarettes. The idea in main is to have the holder in two parts to be screwed together. Between the two sections cotton can he placed which absorbs the nicotine.

A. We see nothing fundamentally new in this idea, as cotton or felt absorbers for nicotine have been made use of for many years. You might, however, obtain a constructional patent. Devices of this kind are not as a rule popular with smokers as they are very messy to handle, and the cotton gets clogged up too quickly.

Receiver-Induction Coil.

(332) Seth Card, Winthrop, Mass., says: "My idea is to have an induction coil in the handle

Telephone Induction Coil Inside Receiver

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

of the telephone receiver instead of having the magnet run back into the handle as it usually does. In other words, I would have a combination telephone receiver as well as induction coil. Is the idea patentable and practicable?"

A. We take pleasure in illustrating the device on account of its originality. This certainly is a clever as well as capital idea. There is no doubt that this device will work, altho we think it would be somewhat less efficient than the regular combination by having the instruments separate.

Patents and Citizenship.

(333) Samuel Guyer, New York, N. Y., writes: "I have perfected an invention, but as I am not a citizen I dislike to ask for a patent. Do you think it is safe for me to apply for a patent?"

A. You need not be a citizen of the United States to apply for a patent. Anyone can apply and take out patents, but you will have to tell your patent attorney of what country you are a subject. This must be stated in the patent application. Otherwise, you will have no trouble in obtaining a patent, providing, of course, the idea is patentable.

Astronomical Facts for All

By Isabel M. Lewis

(*Continued from page 217*)

proximate to the total number of stars in our system. They have assumed a median magnitude of twenty-two or twenty-four, far below the reach of existing telescopes, and considering that there are as many stars below as there are above this median magnitude, they find the total number of stars to be between seven hundred million and eighteen hundred million.

2. *What proof is there that no atmosphere exists on the moon?*

There are no atmospheric phenomena visible on the moon, no evidence of storms, clouds or erosions of the rocky surface, no twilight effects, no haziness of the cusps, no signs whatever of the refraction of light by an atmosphere. When a star passes behind the moon, *or is occulted,* it disappears and reappears with startling suddenness. There is no gradual fading away of the star or change in its color such as would be noticed if its light had to travel thru atmospheric strata increasing in density toward the moon's surface. All shadows on the moon are sharp and black. There is no blurring or haziness of the outlines.

At time of solar eclipse there is no distortion of the sun's limb as the edge of the moon passes over it such as would arise if the sun's light past thru a lunar atmosphere and was refracted thereby.

Also, according to the kinetic theory of gases, the ability of a body to hold an atmosphere depends on its mass and density. Molecules of the gases are continually flying off in all directions. If their velocity exceeds a certain critical amount they may escape altogether from the gravitational control of the body in question.

For the moon this "velocity of escape" as it is called, is less than two miles per second. As the molecular velocity of all the gases of the earth's atmosphere, oxygen, nitrogen, etc., exceed this amount, it is evident that the moon could not hold these gases by its gravitational attraction.

3. *What can one expect to see with a three-inch telescope?*

The rings and three or four satellites of Saturn, the belts and four satellites of Jupiter, the snow caps and most prominent markings of Mars and, according to Prof. W. H. Pickering, a number of the canals of Mars if the condition of the atmosphere, or "seeing," is particularly good; also the craters and other markings on the moon in great detail, the sun-spots, faculae and, with spectroscopic attachment, prominences on the sun, the Great Nebula in Orion and many beautiful double and multiple stars.

If the telescope is equatorially mounted and provided with graduated circles for finding and identifying stars and nebulae, a most wonderful and valuable storehouse of knowledge is opened.

Electrical Oscillators

By Nikola Tesla

(Continued from page 229)

Broadly, the instruments can be divided into two classes: one in which the circuit controller comprises solid contacts, and the other in which the make and break is effected by mercury. Figures 1 to 8, inclusive, belong to the first, and the remaining ones to the second class. The former are capable of an appreciably higher efficiency on account of the fact that the losses involved in the make and break are reduced to the minimum and the resistance component of the damping factor is very small. The latter are preferable for purposes requiring larger output and a great number of breaks per second. The operation of the motor and circuit controller of course consumes a certain amount of energy which, however, is the less significant the larger the capacity of the machine.

In Fig. 1 is shown one of the earliest forms of oscillator constructed for experimental purposes. The condenser is contained in a square box of mahogany upon which is mounted the self-induction or charging coil wound, as will be noted, in two sections connected in multiple or series according to whether the tension of the supply circuit is 110 or 220 volts. From the box protrude four brass columns carrying a plate with the spring contacts and adjusting screws as well as two massive terminals for the reception of the primary of the transformer. Two of the columns serve as condenser connections while the other pair is employed to join the binding posts of the switch in front to the self-inductance and condenser. The primary coil consists of a few turns of copper ribbon to the ends of which are soldered short rods fitting into the terminals referred to. The secondary is made in two parts, wound in a manner to reduce as much as possible the distributed capacity and at the same time enable the coil to withstand a very high pressure between its terminals at the center, which are connected to binding posts on two rubber columns projecting from the primary. The circuit connections may be slightly varied but ordinarily they are as diagrammatically illustrated in the ELECTRICAL EXPERIMENTER for May on page 89, relating to my oscillation transformer photograph of which appeared on page 16 of the same number. The operation is as follows: When the switch is thrown on, the current from the supply circuit rushes thru the self-induction coil, magnetizing the iron core within and separating the contacts of the controller. The high tension induced current then charges the condenser and upon closure of the contacts the accumulated energy is released thru the primary, giving rise to a long series of oscillations which excite the tuned secondary circuit.

This device has proved highly serviceable in carrying on laboratory experiments of all kinds. For instance, in studying phenomena of impedance, the transformer was removed and a bent copper bar inserted in the terminals. The latter was often replaced by a large circular loop to exhibit inductive effects at a distance or to excite resonant circuits used in various investigations and measurements. A transformer suitable for any desired performance could be readily improvised and attached to the terminals and in this way much time and labor was saved. Contrary to what might be naturally expected, little trouble was experienced with the contacts, altho the currents thru them were heavy, namely, proper conditions of resonance existing, the great flow occurs only when the circuit is closed and no destructive arcs can develop. Health, Strength, Vitality

Personal Appearance—All Demand

The STERLING HIGH FREQUENCY **VIOLET RAY**

Specially designed for home use—fitted to work from the ordinary lamp socket—easy to manipulate under control at all times—and contains within its covers the Services of a servant, a doctor of medicine and a nerve and beauty specialist—all in one, ready for Instant service.

The Sterling Violet Ray is invaluable in the treatment of diseases of the skin, mouth, throat and lungs, derangements of the liver, kidneys, stomach and intestines—soreness in muscles and joints—tired or "sick" brains or lack of "nerve tone." It strengthens heart action—cleanses the blood—brings the flush of youth to the skin — enlivens the hair — puts a "spring in your step" and creates a clear eye and brain.

Sterling Violet Ray Generators are based upon the original discoveries of Nikola Tesla, but have been developed to the highest state of perfection, ever reached by Mr. Anthony Longoria, whose long years of practical experience entitle him to the commanding position he holds.

VALUABLE BOOK FREE

We want to send you our book and full particulars about the Sterling Violet Ray Machines. Read how you can treat innumerable diseases and ailments, improve your personal charm, add strength and vitality and help yourself in hundreds of ways. Just mail the coupon or drop a postal. Do it now, this minute, before you forget it.

ADDRESS .....

CITY..... STATE.....

nally I employed platinum and iridium tips but later replaced them by some of meteorite and finally of tungsten. The last have given the best satisfaction, permitting working for hours and days without interruption.

Fig. 2 illustrates a small oscillator designed for certain specific uses. The underlying idea was to attain great activities during minute intervals of time each succeeded by a comparatively long period of inaction. With this object a large self-induction and a quick-acting break were employed owing to which arrangement the condenser was charged to a very high potential. Sudden secondary currents and sparks of great volume were thus obtained, eminently suitable for welding thin wires, flashing lamp filaments, igniting explosive mixtures and kindred applications. The instrument was also adapted for battery use and in this form was a very effective igniter for gas engines on which a patent bearing number 609,250 was granted to me August 16, 1898.

Fig. 3 represents a large oscillator of the first class intended for wireless experiments, production of Röntgen rays and scientific research in general. It comprises a box containing two condensers of the same capacity on which are supported the charging coil and transformer. The automatic circuit controller, hand switch and connecting posts are mounted on the front plate of the inductance spool as is also one of the contact springs. The condenser box is equipt with three terminals, the two external ones serving merely for connection while the middle one carries a contact bar with a screw for regulating the interval during which the circuit is closed. The vibrating spring itself, the sole function of which is to cause periodic interruptions, can be adjusted in its strength as well as distance from the iron core in the center of the charging coil by four screws visible on the top plate so that any desired conditions of mechanical control might be secured. The primary coil of the transformer is of copper sheet and taps are made at suitable points for the purpose of varying, at will, the number of turns. As in Fig. 1 the inductance coil is wound in two sections to adapt the instrument both to 110 and 220 volt circuits and several secondaries were provided to suit the various wave lengths of the primary. The output was approximately 500 watt with damped waves of about 50,000 cycles per second. For short periods of time undamped oscillations were produced in screwing the vibrating spring tight against the iron core and separating the contacts by the adjusting screw *which also performed the function of a key*. With this oscillator I made a number of important observations and it was one of the machines exhibited at a lecture before the New York Academy of Sciences in 1897.

Fig. 4 is a photograph of a type of transformer in every respect similar to the one illustrated in the May, 1919, issue of the ELECTRICAL EXPERIMENTER to which reference has already been made. It contains the identical essential parts, disposed in like manner, but was specially designed for use on supply circuits of higher tension, from 220 to 500 volts or more. The usual adjustments are made in setting the contact spring and shifting the iron core within the inductance coil up and down by means of two screws. In order to prevent injury thru a short-circuit, fuses are inserted in the lines. The instrument was photographed in action, generating undamped oscillations from a 220 volt lighting circuit.

Fig. 5 shows a later form of transformer principally intended to replace Rhumkorf coils. In this instance a primary is employed, having a much greater number of turns and the secondary is closely linked with the same. The currents developed in the latter, having a tension of from 10,000 to 30,000 volts, are used to charge con-

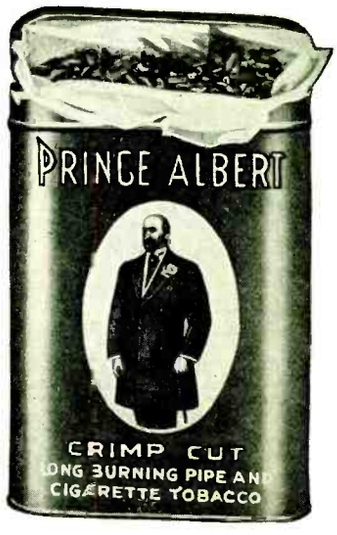
PRINCE ALBERT



the national joy smoke

SAY, you'll have a streak of smokeluck that'll put pep-in-your-smokemotor, all right, if you'll ring-in with a jimmy pipe or cigarette papers and nail some Prince Albert for packing!

Just between ourselves, you never will wise-up to high-spot-smoke-joy until you can call a pipe or a home made cigarette by its first name, then, to hit the peak-of-pleasure you land square on that two-fisted-man-tobacco, Prince Albert!

Well, sir, you'll be so all-fired happy you'll want to get a photograph of yourself breezing up the pike with your smokethrottle wide open! Quality makes Prince Albert so different, so appealing. And, P. A. can't bite or parch. Both are cut out by our exclusive patented process!

Right now while summer's young you get out your old jimmy pipe or the "papers" and land on some P. A. for what ails your particular smokeappetite!

Buy Prince Albert everywhere tobacco is sold. Toppy red bags, tidy red tins, handsome pound and half pound tin humidors—and—that classy, practical pound crystal glass humidor with sponge moistener top that keeps the tobacco in such perfect condition.

"Hello Europe" --Via Radio

By Charles M. Ripley

(*Continued from page* 210)

the "high tension" and "high frequency" juice of the 20th century! A party of visitors arrives by automobile.

As a member of the party offers the chauffeur a cigar, his hand touches the steel door of the motor car, and he receives a terrific electric shock! The experts smile. They are standing immediately underneath the station end of the antenna. These 32 slender wires, highly charged with palpitating currents of man-controlled lightning, here begin their dizzy climb to a height approaching that of the Equitable Building, and then stretch away a full mile, like semi-invisible cobwebs hung on catenary wire suspenders.

At the point where they stand the air pulsates with invisible electro-magnetic energy; and the jolting, nerve-wringing shock results from the fact that the automobile is equipt with RUBBER TIRES! The current caught from the air by the metal parts of the car can find its escape to the ground only thru the body of the uninitiated who may touch the car's metal framework.

What more fitting introduction could one have into the mysteries of real radio at work! Suppose we enter the station with this party.

The High Frequency Alternator.

After the incident of the automobile shock, we visitors are decidedly "wireshy," so the frequent "DANGER" signs are entirely superfluous; one man even hesitated to touch a water faucet!

From the mechanical and electrical standpoint—as well as from the laymen's viewpoint—the large high frequency alternator is the big outstanding feature of the station.

An alternator is a dynamo that makes alternating current electricity. A "high frequency alternator" is a dynamo generating an electric current that alternates, or reverses itself very frequently. Alternating current for light and power has a "frequency" of 25 to 60 cycles per second, but the alternating current used in this wireless station has a frequency of 22,000 cycles per second.

A high or rapid frequency is used for wireless work, because electromagnetic waves are thrown off from wires in which such electricity flows.

That was sufficient for us to take new interest in the big machine that was throbbing with such weird energy. Evidently, this was the last word in wireless power; for was not this the mightiest station on our hemisphere? Moreover, high frequency electricity is the *sine qua non* for wireless, and here working under our very noses was the first big and really successful high frequency alternator ever built in America. In this room, then, is where a new trail was blazed toward the supernatural; here Jules Verne himself would stand agape, and, perforce, confess that his fiction has been outdone.

"The present state of the Art!" With what force that expression strikes one today. What romantic stories will some day be written of the struggles of American wireless engineers to outdo the Germans. Energy from this monster alternator was a powerful factor in bringing peace to a frantic world.

And it is a wonder of mechanical simplicity as well as a new electrical departure. *The only thing that moves is a solid steel wheel without wires, and containing no copper whatsoever. This "rotor," as it is*

Experimenter Pub. Co., Inc. Book Department 233 Fulton St., N. Y.

called, weighs nearly 3 tons, with its shaft, and rotates at 2,100 revolutions per minute. This is not considered a high speed in the electrical profession, and yet if this rotating element were to roll along upon the ground at its present speed it would run from Schenectady, N. Y., where it was built, to New Brunswick, N. J., *in less than thirty minutes!*

Wonderful Regulation of 200 K.W. Alternator.

The speed of this rotating element is regulated to within 1/10 of one per cent., regardless of the amount of electrical load thrown on and off the circuit in the sending of messages.

The alternator is rated at 200 kilowatts, and weighs about 12 tons without its base. The floor space occupied by the machine, including its base, and the driving motor, is only 8 ft. wide by 20 ft. long. This 160 sq. ft. is less than 2 per cent. of the total floor area in the radio station, which is 10,800 sq. ft.

The advantages of the high frequency alternator were explained by its designer, Mr. E. F. W. Alexanderson, consulting engineer, inventor and radio specialist of the General Electric Company:—

1. As heard by the operators at receiving stations, the tone of New Brunswick's signals is a clear "whistle" of a flute-like quality.

2. The continuous wave it sends out is clear cut, *with no "harmonics."* "Harmonics" have various frequencies and different wave lengths, and interfere with other stations. Harmonics are useless wave lengths which "fringe" the message. There is no fringe or "penumbra" to the waves emanating from the new H. F. Generator.

3. It is steady in its operation, and has run for WEEKS without interruptions to service. In February it was operating 97¾ per cent. of the time.

4. It is cool, clean and quiet in operation as a motor.

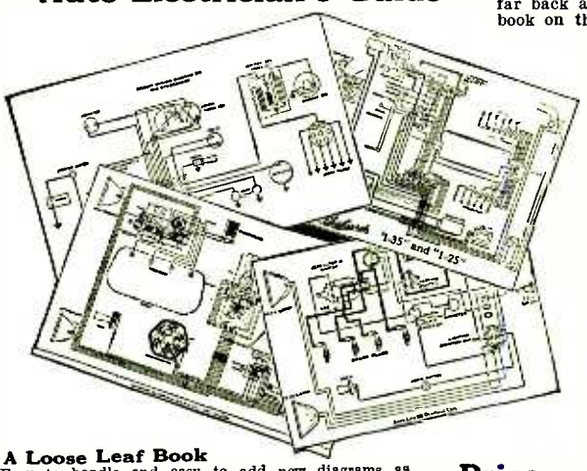
5. It is of massive construction, and resembles other electrical machines in a general way—not a freakish machine.

6. It has a low power consumption. The record of one month's work, 94 per cent. time in operation, shows a power consumption averaging less than 200 K.W. drawn from the power system, including all auxiliary power demand for station and living quarters. This renders the most continuous and reliable transatlantic radio transmission. On a "freak test" a message sent by *only ½ K.W. in the antenna, reported received at a Pacific coast station* 2,400 *miles distant.*

The Magnetic Amplifier.

When a soldier pulls the trigger of his rifle and releases the energy stored in the powder, the motion of his finger is amplified; i.e., a small cause produces large effects. In the electrical world for many years we have had telegraphic "relays." These are devices which permit a small flow of electricity from one source to set in motion a large flow of electricity from another source. Here again a small cause produces a large effect; so relays are practically amplifiers.

Now in the case of both the trigger and the relay we have mechanical motion—i.e., moving parts. These moving parts introduce mechanical and electrical difficulties when it comes to handling large currents of electricity. These moving parts thus constitute the limitations of electrical amplifiers which depend upon mechanical motions. They are "the neck in the bottle."

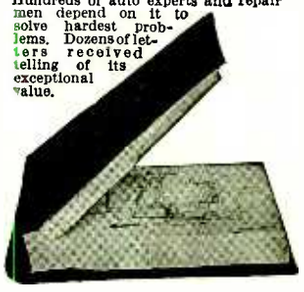


But the magnetic amplifier has no moving parts, hence it has correspondingly less limitations. Its principle depends upon the invisible and *motionless action* of magnetism within the iron.

To return to the "trigger analogy." When

(*Continued on page* 268)

850 WIRING DIAGRAMS
in the new edition of
Auto Electrician's Guide



Contains wiring diagrams for every car on the market including the new 1919 Starting and Lighting Systems for Ford cars, also diagrams for Baker R & L and Detroit Electric and pipe connections for Stanley Steamers. Covers all kinds of systems from 1912 to 1919 and many as far back as 1906. Most complete diagram book on the market.

Highly endorsed by auto manufacturers, garages, service stations and auto experts everywhere.

No problem too puzzling if you have the Auto Electrician's Guide.

Any "Old Sticker" Quickly Solved with the help of this book. Saves hours of time on both old and new jobs. Impossible for even experts to know all cars but no car will "stick" you when you have this book. A practical, easily understood "guide" that will simplify all auto-electric problems and make it possible for you to quickly overcome hundreds of starting, lighting and ignition troubles which otherwise would take hours to solve. Extensively used all over the country. Hundreds of auto experts and repair men depend on it to solve hardest problems. Dozens of letters received telling of its exceptional value.

A Loose Leaf Book
Easy to handle and easy to add new diagrams as issued. Convenient to slip into the coat or car pocket and invaluable as a constant companion for repairmen. Scores of trouble cases quickly and easily corrected with the help of this guide. Send Today. Price $7.50, Postpaid. **Money refunded if not satisfactory.**

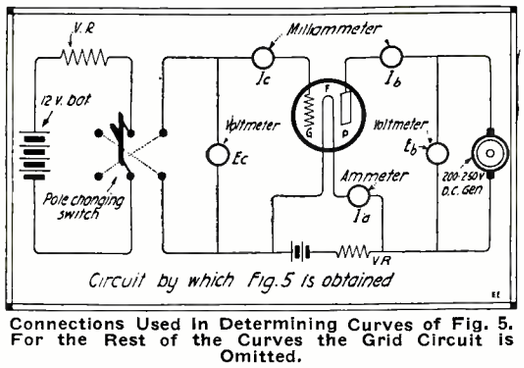
The Design, Pumping and Testing of Audion Tubes

By C. Murray

(*Continued from page 235*)

The writer plotted curves on two Fleming valves; one with a cylinder ⅜ inch in diameter and the other ½ inch diameter. The results are shown at Fig. 4. During the test Eb was kept at 200 volts and Ia was varied until a saturation point was found. The grid, as aforementioned, is the principal element, and it is upon this that the main action of the Audion tube is based. The size or surface area depends entirely on what it is to be used for.

Graphs Showing Actual Tests and Space Currents for Two Different Audions. Grid in Tube No. 629 Had Twice as Many Turns as Grid In Tube No. 632.

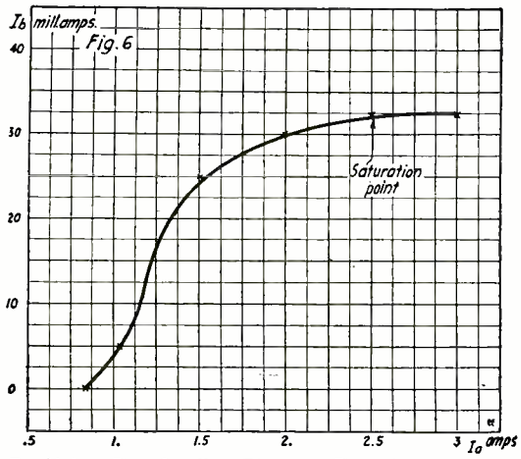


For instance, if we desire to use a tube for an *amplifier,* then we design it so that a small charge on the grid will produce a large effect on the plate current. If we wish to use it as an *oscillator* or power tube, it is not necessary or essential to have a large grid, but it must be constructed much heavier to prevent sagging during the pumping and while it is in operation as an oscillator.

The writer constructed two tubes with the grids as follows: The grid in tube No. 629 was made of .020-inch nickel wire, wound in the form of a spiral, ¼ inch in diameter, making a total of 26 turns. The grid in No. 632 tube was also the same diameter, but it only had 14 turns. The same plate spacing in both tubes was used. The results are used in graph Fig. 5. We can readily see that both tubes will give us 8 milliamperes of space current, when the grid is free, and by giving the grids a small negative charge one will drop almost to zero space current while the other only dropt to 7.5 milliamperes. We also find when we change the charge to positive that it will increase the Ib on No. 629 a great deal more than on the tube with the small grid.

By referring to the drawing of the vacuum pump, Fig. 1, the reader will see that it is constructed entirely of glass, with the exception of the mechanical pump or "backer." The *backing pump* used by the writer is of the rotary type and immersed in oil to prevent any leakage of air. With it a vacuum of from 8 to 15 mm. of mercury is readily obtained.

The *Aspirator* plays the principal part of the system and is indicated by 3, 4, 5, 6, and it is with this apparatus that we obtain the highest vacuum known to-day, which is very necessary in practically all vacuum tube work.



The mercury in the aspirator is used to absorb the gases which are generated by the bombarding or heating of the metal in the tube being pumped. The mercury must be heated to the boiling point before it starts its work of absorption. It has been estimated that a vacuum of 1 millionth of a mm. of mercury is obtained by the use of the aspirator.

Connections Used In Determining Curves of Fig. 5. For the Rest of the Curves the Grid Circuit is Omitted.

Liquid air is also used in the pumping process, to prevent or freeze any mercury vapor which has not been condensed on the walls of the aspirator from passing into the lamp while it is being pumped; for if we should allow a very small amount of the mercury vapor to get into the tube it would cause it to show a blue haze, thus greatly reducing its sensitiveness and it would heat up considerably.

We will here describe the pumping of tube No. 632 in detail: First the tube was sealed on the pump and an electric oven was placed around the tube. The mechanical pump was started, the current turned on in the oven and also the aspirator heater—the liquid air was placed in a "Thermos" bottle and the bottle was then placed outside the air trap. When the heat in the oven reached 150° C. the filament was connected up to a 15-volt transformer thru a variable resistance and glowed at 9 volts. Next the grid lead was connected to a 250-volt D. C. generator thru a variable resistance; the current was then turned on—the tube immediately filled with a bright blue haze—in a few minutes the grid began to get

By Using Too Small a Plate or Too Short a Filament in the Audion We Will be Limited in the Amount of Plate Current We Can Pass, as by Referring to Fig. 6 We Will Find a Point of Saturation; That is, if We Raise the Filament Temperature Still Higher the Value Ib Will Remain at a Certain Point.

(*Continued on page 266*)

Learn WIRELESS —NOW— Enter This New Field of Greatest Opportunity

NOW that peace is here wireless offers the greatest opportunity of the day to the young men of America. The experimental stage has passed. Wireless now equals in importance telegraphy and telephony, and if the present commercial wireless program is carried out, it may supplant them by the end of 1919. It has earned its place among the great commercial industries of the earth. So great has been the development and growth of Wireless in recent years that there is now a tremendous shortage of operators.

Peace Increases Demand For Wireless Operators

Actually thousands upon thousands of Wireless Operators, Inspectors, Mechanics, Electricians, and Radio Draftsmen will be needed for permanent "peace time" wireless positions at bigger salaries than have ever before been paid.

Peace means a bigger demand for men in every branch of wireless and is opening up new fields of Commercial Wireless activity which will fairly revolutionize present methods of communication.

No Previous Experience Necessary

You Can Learn Wireless In Ten Weeks In Your Own Home, through our practical home study wireless course. No previous experience or training is necessary in order to become a Successful Wireless Expert With our help you can quickly qualify for a good position at big pay. Many of our students have secured positions before completing the course. You will make rapid progress from the start because our course is based on actual practice and teaches you what you will need to know to make a big success of Wireless work.

Get Your Instructions From the Nation's Capital

(Our Course is endorsed by U. S. Government Officials.)

The National Radio Institute headed by authorities who have been closely allied with government training of students, was established in 1914 and is the first school in America to successfully teach Wireless by Mail. The work is under the direction of J. E. Smith, E. E., director of the Radio Department, Howard University, and E. R. Haas, formerly of the Radio Division of Yale University.

We now have students throughout the world. Our location in the Nation's Capital together with the standing of our officers and their wide acquaintance among government officials, connected with Wireless activities, place us in position to give our students the best instruction obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel and See the World

If you want to travel and see the world—go to foreign countries, and increase your knowledge of world affairs, Wireless offers you the chance of a lifetime. However, you are not obliged to travel, but may secure a permanent position at one of the big Land Stations, Railroad, Telegraph, or Steamship companies, if preferred.

Pay as You Go Along With Your Lessons

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down on our convenient payment plan, and small following payments, enables you to earn the cost of your tuition while actually learning to be a wireless operator.

Earn up to $250.00 per Month

In the short period of ten weeks we can make of you a wireless operator, a man with a profession, independent, and not subject to the rise and fall of wages in the labor market. Salaries are as high as $250.00 per month. We give you this training at home, by mail, in your spare time. It is not necessary for you to lose any time from your work to take the course. Then when you have received your diploma from us, we help you find a good position.

FREE INSTRUMENTS TO EVERY STUDENT

In addition to text books, lessons and personal instruction, we send you, while taking our course, a Home Practice Set consisting of a standard sending key and buzzer, and a Universal automatic wireless transmitting and receiving set. These instruments are free to every student. No other school can offer you what we do.

Announcement - - Opening of Norfolk School

The demand for our Course has grown to such an extent that we are now preparing to open a school in Norfolk, Va., which will be under the management of Mr. A. H. Van Nostand, Radio Inspector of the Third Radio District.

FREE Our booklet, "WIRELESS, the Opportunity of Today", gives you complete information in regard to our course, the quick and easy methods by which you can master wireless and other important facts you should know. It is free. Just mail the coupon. No obligation whatever on your part.

—MAIL THIS COUPON TODAY—

Wireless Receiving Ban Raised

MESCO WIRELESS PRACTICE SET

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No. Price

342 Telegraph Practice Set, with Battery and Cord $3.24

Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for Learning the Morse and Continental Visual and Audible Codes

This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord $4.05

Weighs 4 lbs. packed. Price does not include postage.

MESCO RADIO BUZZER

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required.

It consists of practically a closed circuit field of low reluctance, having a steel armature to which is riveted a strap supporting a movable contact. The armature tension is adjustable by means of a screw with a milled head large enough to be easily and permanently adjusted with the fingers. The stationary contact is adjusted by means of a similar screw. The magnet coils are connected in series with a total D. C. resistance of 3.9 ohms. Shunted across these coils is a resistance having a D. C. value of 3 ohms. This shunt eliminates all sparking such as occurs at the break on ordinary radio buzzers and the energy saved thereby is transferred into any oscillating circuit connected to it, the result being that this buzzer as constructed radiates five times more energy than any other existing type. All connecting wires liable to be broken are eliminated. Contacts are of genuine platinum, which is essential in order to maintain a constant note. The parts are mounted on a Condensate base to insure constancy in operation.

Diameter 2 in., height 1¼ in. The cap is attached to the base by a bayonet joint.

List No. Price

55 Mesco Radio Buzzer $2.05

We carry a Large and Complete Line of Standard Wireless Material Recognized by Experts as such with Competent Experienced Wireless Attendants in Charge

The Design, Pumping and Testing of Audion Tubes

By C. Murray

(*Continued from page* 264)

red hot, and soon the haze could only be seen close to the grid. Then I changed over on the plate lead and worked it a while the same way as the grid, until it became red hot. Then I went back to the grid and finished it up. I shifted to the plate again, which had a slight haze on it, so I left it on till it was "clear." Then I connected the plate and grid together and heated them with the 250-volt generator for five minutes.

I turned off the oven and removed it and allowed the tube to cool. After it was cold I glowed the filament at 7.5 volts and connected the D. C. generator to the plate lead—it became red hot and was clear, so I sealed it off the pump with a blow torch. This completes the pumping of the Audion or three-element detector.

The pumping of the Audion in this way is very necessary, especially one on which we are going to use a "B" battery of 100 volts or more—for instance, the power tube, which requires at least 200 volts before it will give much of an output.

Next we have the glowing or aging of the filament, which stabilizes the action of the filament. It allows the coating of the platinum filament to firmly fix itself to the platinum and also burns away any of the remaining gases which might be in the tube. I trust the readers can understand how their vacuum tubes are constructed after reading the foregoing.

Operate Your Audions on A. C.

By Elliott A. White

(*Continued from page* 234)

for alternating current operation is the rheostat or potentiometer R2, and the large capacity condenser C4. The rheostat has a resistance of 8—10 ohms, or other value so long as it is not too high, nor so low as to draw too much current; connections are made to the two ends, with a movable contact covering all points. The condenser C4 is made of 6 or 8 discarded telephone condensers (1 or 2 mfds. each, thoroly tested for short circuits and leaks) with a total capacity of 8—12 mfds., the higher the better, around that figure. R3 is the usual filament rheostat if one is necessary, altho it is best to design any set with as few and as "fool proof" adjustments as possible. A fixt condenser of .015 mfd., or less may be bridged across the 'phones, tho it is not indispensable. A rheostat R4 may be added for the rectifier filaments, and numerous other modifications and improvements will suggest themselves. It is theoretically possible to have only one rectifier tube, but it might be noisy, and I should want to try it before recommending it.

The operation is simplicity itself. The stept-down A. C. heats the filaments in the usual way and has been employed for this purpose before. Cheap bell-ringing transformers can be used here just as well as winding a special transformer. The *new stunt,* however, lies in using the *rectified A. C.* for the "plate." This method has already been used for *transmitter* oscillators where the noise was not prohibitive, and even then a high frequency of 2,000 was provided. But it works very well on receiving tubes, even on the usual 60-cycle house-lighting circuits, if proper precautions are taken. (It is only a natural step from the receiving set here described to an

undamped wave radiotelegraph or radiotelephone *transmitter,* operated from the handiest lamp receptacle.) It will be seen that the rectifier tubes will pass current in only one direction, that is from plate to filament, so that during each half-cycle the current from one-half of the winding T3 T4, charges the condenser C4; the side of the condenser towards the high voltage winding being always negative, and that towards the low voltage winding always positive, as indicated in the figure. It is on account of the polarity of the condenser, that separate windings T2 and T5 T6 must be provided for the filaments of detector and rectifiers. The charge accumulates on the condenser C4 as available D. C. (voltage equal to half that of winding T3 T4) and will make a hot snappy spark if the condenser is short-circuited. The need of the large capacity for C4 is to keep up the potential when current is drawn off for the detector circuits, and to reduce the pulsations from the 60-cycle A. C. The only adjustment necessary is to locate the lever H of rheostat R2 at a point on the resistance, placed across the filament, where the hum is balanced out, an adjustment which has to be made only once. It is obvious that the whole apparatus is extremely simple, as the opening or closing of main switch S (with fuses FF to protect the transformer) controls all circuits. In the hook-up indicated in the figure, the only adjustments in tuning are of the inductances, coupling and condensers in the antenna and secondary, that is, L1 (C1) L2 C2 and coupling between L1 L2, which is delicate. Amplifiers may be added and operated from the same windings. My set oscillates "like a bird" on any setting.

With *low vacuum* tubes it might be necessary to provide for adjustment of the plate voltage as these tubes are sensitive but critical in adjustment, and this can be done either by winding T3 T4 to a higher voltage than ordinarily needed and cutting it down to the proper point by means of a variable high resistance in series with the 'phones (a potentiometer across C4 would discharge the condenser); or by means of variable taps on the transformer. In case bell-ringing transformers are used for T2 and T5 T6, the latter having no tap in the middle, a rheostat may be bridged across the whole winding and the lever adjusted as in the case of R2 H.

My experience has been that the adjustment of the rheostat or potentiometer R2 H, will cut out almost all the hum of the phones in receiving, but in case local conditions produce "cross talk" in some other experimenter's outfit, he will find that by proper insulating or grounding or balancing of transformer core, case, and windings, or by reversing the supply leads where the house wiring is grounded on one side, he can get rid of any objectional noise.

In making my transformer out of an old burnt-out 1 KW pole transformer core, I found that putting the whole transformer core and windings back in the iron case was advantageous in keeping induction from the core away from the rest of the set. The entire rectifier and associated apparatus should be kept *several feet away from the receiving set,* and all leads kept short, straight and separate, as in any other shipshape and efficient outfit. Bell-ringing transformers, if used, should have metal containing cases. The most important thing in using alternating current in this way, however, is care in the tuning adjustments, as there are certain critical adjustments which will make the set "howl" on account of audible beats between local audio-frequency beats and the 60-cycle alternations, besides other causes. For example, I find that in my set, keeping within "regions of silence" from interference depends largely on exact coupling, and that I have to keep L2 above a minimum amount, and to keep C2 at a small capacity—under .00025 mfd.,

"MATCHED TONE"

"Superior" Set 2000 ohms

PRICE $6.00

FOUR FAMOUS BOOKS

Wireless Course in 20 Lessons

By S. Gernsback, A. Lescarboura and H. W. Secor. E. E.

A course that tells you everything you can possibly want to know about "Wireless". The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject.

Size of book is 7 x 10¼ in., 160 pages, 350 Illustrations, 30 tables.

THE EXPERIMENTER PUBL. CO. Book Dept. 233 Fulton St., New York

or in the lower half of the scale on my small standard variable condenser. But I have not found the slightest difficulty in getting any desired adjustment of tuning or selectivity without starting "cross talk." A little practise is all that is necessary to make the set seem as silent as with *direct current*. Even if a faint hum still remains, it is never noticeable when fair signals are coming in, especially inasmuch as the A. C. hum is so low pitched compared with the signals, and quickly forgotten, like the scratch of a good phonograph. If anyone is unable to duplicate these results, it is his own fault. Of course a storage battery may be used for the filament, with rectified A. C. for the plate; or dry cells for the plate and a toy transformer for the filament.

This use of A. C. avoids all the bother and expense of storage batteries that cost much and require constant care and recharging; and of innumerable "plate" cells that cost a fortune now and last but a short time. The complete outfit can be constructed for the price of one "plate" battery renewal. I believe it to be the simplest and cheapest "stunt" yet.

"Hello Europe" --Via Radio

By Charles M. Ripley

(*Continued from page* 263)

the naval radio operator in Washington presses the key of his telegraphic instruments he PULLS THE TRIGGER. An instant later the effect is noted on the instruments and apparatus at the New Brunswick station 180 miles distant.

The tiny electrical impulse from Washington is used to strengthen the magnetism inside the wonderful new magnetic amplifier; and this, within the very same instant, releases the strange energy waiting inside the throbbing breast of the H. F. Alternator; and then, out on the high spun antennae flashes the AMPLIFIED dots and dashes which express the will of the American people to a listening world. So the magnetic amplifier receives minute impulses and permits terrific electric surges to enter the ether.

No device has ever equalled it for clear enunciation. There is a sharp staccato note to its messages. One way of expressing its achievement is, "New Brunswick does not slur its words."

Multiple Tuned Antennae.

A radio station without tuned antennae would be as short range an instrument as a violin without its "box" or a piano minus its sounding board. The volume of sound in each of these instruments is considerably augmented by their resonant wooden attachments, and so they can be heard at greater distances.

Just so the tuning of wireless antennae makes them "electrically resonant" with the vibrations, and augments the stations' powers of transmission.

But tuning does more than augment—it also refines the vibrations. The best comparison perhaps is that of an organ pipe.

Analogy of the Organ Pipe.

One refinement possest by the organ over practically every other musical instrument is that EACH TONE is provided with its own individual resonating pipe—separate and distinct. Since the *length* of the pipe is just ¼ the *wave-length* of its tone, it resonates only the pure tone desired. This refines the quality of the tone, as well as

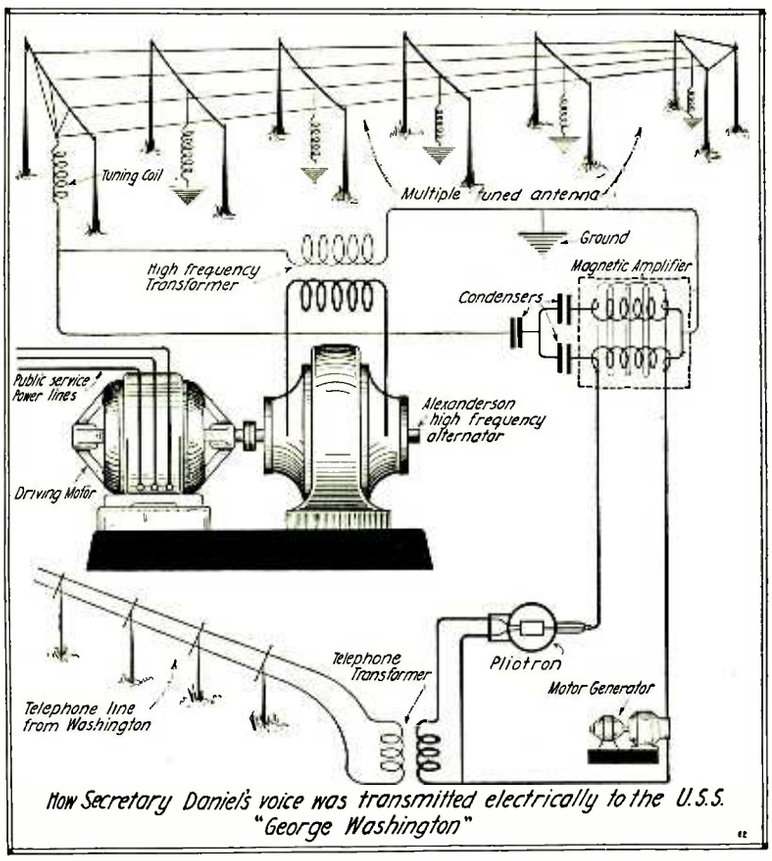

Chart-Diagram Showing the Radio Circuits at the New Brunswick Station, from Which Radio-Telegraphic and Telephonic Communication with Europe is Carried On.

amplifies its volume very markedly.

And just so the tuned antennae of a wireless station both purify as well as amplify the particular tone or vibratory frequency of the station's generator. Or putting it another way, the wires of the antennae are given electrical characteristics so that they "tingle" or "vibrate" electrically, in tune only with the particular vibrations set up by the one high frequency alternator in the station, and with no other.

Mr. E. F. W. Alexanderson explained the achievements of multiple tuned antennae as follows:

"Speaking in the simile of the organ pipe the action of the multiple-tuned antennae may be explained as follows:

"Whereas, in all previous systems the antennae may be likened to a single organ pipe, the multiple tuned antennae is six organ pipes tuned to the same pitch and sounded simultaneously in such a way that the combined sound is six times as strong as the sound emitted by each pipe. While it takes six times as much power to blow the six pipes as one pipe, the greatly increased efficiency of the new system is realized by the fact that it would require 36 times as much power to blow one pipe so strongly that it would emit a sound equally strong as the combination of the six pipes."

The six fanciful organ pipes are large "tuning coils," and as a happy by-product of their action they also serve as lightning arresters. In the accompanying illustrations these antenna tuning coils are clearly shown, as well as their relation to the antenna. One end of each tuning coil is connected to earth.

Our Heels Spark.

It was dark when we left the station, but there were two more surprises in store for me. As we walked toward the automobile under the antennae, we in the rear were astonished to *see brilliant sparks leap from the heels of those in front.* The experts explained that the electricity from the air was caught up by our bodies and discharged from our shoe nails into the ground. As an experiment one of us stooped over to touch the ground and received even a stronger shock than formerly when he stept out of the automobile that morning!

As we sped cityward, we looked back and marveled in mental perspective:

A sparkless, arcless, noiseless, wireless *of six times the earlier efficiency;* a clearer quality; complete radio silence between its radio im-

DUCK'S BIG 300 PP. Wireless & Electrical

Catalog is now as it always has been, the largest and most complete and dependable Wireless Catalog published. Mailed for 12c in stamps or coin which may be deducted on first order of one dollar. Catalog not sent otherwise. This catalog costs us twice the price of other catalogs.

Everything in wireless *worth while* is listed in this catalog. The experienced amateur will tell you to see our catalog before buying. You are thereby insured against an unwise purchase. It is the *Beacon Light* to guide you right in the selection of your wireless apparatus. No bigger or better values are obtainable elsewhere. Send for revised price list. It is yours for the asking.

THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio

pulses or immense power; yet small interference with other sending stations; sending 20 words per minute regularly and 90 words in test! Surely it is a privilege to live in the 20th century and to learn about these things while in the making—for many things are more interesting in their development than when fully grown to a lusty manhood.

That night the discussion of the day's visit opened up a great vision to us. A message cabled from New York to Queenstown goes to Queenstown only; but when the wireless flashes a message from New Brunswick it goes to every point of the globe simultaneously! And when we heard that it only costs $30,000 per year for power to send words to a *thousand* wireless receiving stations—then the possibilities of wireless in the future seemed to expand without limit. Here is the point: One word from New Brunswick to all the world costs—well—ask Uncle Sam! One word from New York to Queenstown only, costs 25 cents by cable.

As a whole, it may be said that the possibilities for extension of radio as a system of world communication have barely been touched upon, but the radio technique has now reached the point where it needs only capital and business initiative to duplicate and exceed in speed, accuracy and economy the trans-oceanic cable traffic; and for each sender to extend the service to all parts of

THE CALL OF W DOUBLE I

(Mr. Webster is a wireless operator at the U. S. Naval Radio Station, New Brunswick, N. J., the most powerful radio station in the United States.)

THE winter sun has settled,
Darkness is creeping near;
The moon slips behind a cold black cloud,
Denying the world of his cheer.
A sentry stands faithful to duty,
As out through the limitless sky
Crashes the call from Loyal America,
The call of W double I.
It speaks and the whole world listens,
And in the far-off city of Rome
A happy American sailor
Hears the call of his Home, Sweet Home.
It comes to the listening German,
As the Eagle's own warning cry,
And he shudders as he hears that warning,
The call of W double I.
The Frenchman hears and is comforted,
For he knows that it speaks with power;
He knows that aid is coming,
Though he knows not the day nor hour.
The load on his heart is lighter
As he settles back with a sigh;
It comes to his ear as music,
The call of W double I.
Out on the wind-swept ocean
The sailor hears the call;
He knows it comes from America,
The grandest land of all.
He grasps its high-pitched music
As it crashes through the sky,
'Tis to him as the song of the angels,
The call of W double I.
In distant cold Alaska
A soldier's eyes grow bright
As he murmurs, "Yep, that's him calling,
And he's coming good to-night."
And he sits and listens closely,
With that stern look in his eye,
For he knows 'tis the voice of Old Glory,
The call of W double I.
The moon comes out from his hiding,
And smiles his praising cheer,
On the land of Free America,
Whose call he, too, must hear.
The clouds roll away to the southward,
The stars peep down from the sky,
And the whole world stops to listen
To the call of W double I.

—H. R. WEBSTER, U. S. N.

the globe requires merely receiving stations.

New sending stations equalling New Brunswick in power would require about a half million dollars to construct and equip.

Receiving sets of a very high grade type can be purchased for less than $100 and can be installed on a table, indoors. Messages can be sent from 20 to 90 words per minute; and with a station operating over 90 per cent. of the time, SOMEONE is going to make a fortune. Or, not thinking along mercenary lines alone, why couldn't great news gathering syndicates have their own wireless systems; or other corporations with world-wide interests might have their own private plants. Perhaps the idea of John Wanamaker with his private wireless stations may be the forerunner of a series of "jitney" wireless systems by the thousands. Who can tell in these early days along what lines the development will take place?

President Wilson's Ship Fitted With Radiophone

When the *George Washington* cleared for Brest she had installed in her wireless room a telephone transmitter which permitted the President to hold wireless conversation with the Navy radio station at New Brunswick, N. J., and with Washington direct. This was made possible by the use of the General Electric Company's apparatus designed by Ernest F. W. Alexanderson.

Wireless telephone messages were sent by this apparatus to the President thruout his last voyage to France, but the steamship was not fitted with the same apparatus and he could not reply in kind. Recent experimental work, however, perfected the answering facilities, and thus made it possible for the President to "talk back" to his Washington governmental associates.

Talking Thru the Trees

By Major General George O. Squier

(*Continued from page* 204)

another tree-antenna, and automatically returned to the sender on a wire system, thus making the complete circuit. Illustrated at Fig. 6.

Long distance reception on any wave length from all the larger European stations and from our ships at sea was easily accomplished and traffic copied on a twenty-four hour schedule by the regular enlisted operators of the Signal Corps. A small portable house serving as a field laboratory was erected in the midst of the forest area on Grant Road, Washington, D. C., between the Bureau of Standards and Chevy Chase, Maryland (see accompanying illustration), and here was assembled a collection of the most efficient vacuum tube amplifiers developed to date by the Signal Corps of the Army, the Navy, the British and the French, and of commercial radio firms in the United States. With these unusual facilities it was a matter of a few days to test out, at least in a superficial manner, a large number of proposed arrangements *using trees as the antennae.*

Fig. 7 shows how a number of trees can be connected up to give the effect of one large antenna.

In France officers of the Signal Corps, by the simple device of driving a spike into a tree-trunk to which to connect the audion set which wireless operators use to magnify the dot and dash little sounds which make up wireless messages, found it was possible to "listen in" on communications between German airplanes and the German lines. Messages were thus intercepted in spots into which it would have been impossible to transport a field wireless apparatus. See Fig. 8.

Thousands of Electrical experts are needed now. Come to the great shops of Coyne and let us train you quickly by our sure practical way backed by 20 years of success.

Earn $125 to $300 a Month

Come to Coyne where experts train you on the actual apparatus. You work on everything from the simple bell to the mighty Generators, Electrical Locomotives and Power Plants. Everything to make you a Master Electrician. Look at the picture taken from life in our shops.

Become an Expert in 3½ Months

No need of taking 1 to 4 years to become an expert. We have proved this in thousands of cases. We are the only school teaching by the original Coyne methods, which means no books, no classes—all practical training.

Earn Your Way. Our employment department will help every ambitious man to earn a part or all his expenses—without charge.

Bennett W. Cooke, Director
COYNE TRADE AND ENGINEERING SCHOOLS
Dept. 27, 39-51 E. Illinois Street
CHICAGO, ILL.

LEARN DRAFTING

The country needs hundreds of skilled Draftsmen in all lines at big salaries.

Coyne is the only school in the country that gives you the advantages of big shops full of construction and machinery. This makes our drafting courses practical, just like the job you'll have when you graduate. You can't get this in any other school.

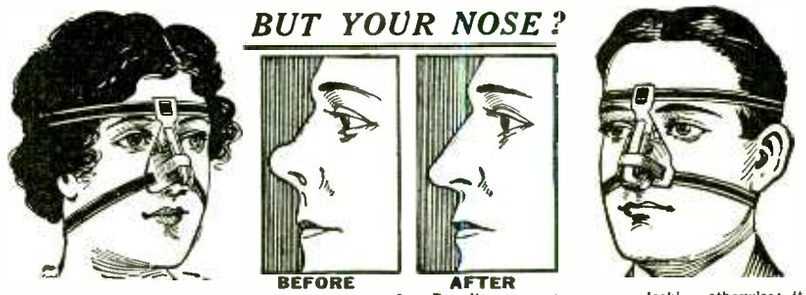
WE TEACH ELECTRICITY, DRAFTING, MOTION PICTURE OPERATING AND PLUMBING

We teach all these professions in such a thorough, practical way that when you finish you can step right into a position of responsibility and big pay.

Fill out the coupon *now* and send it for our big free book of information. It tells what others are doing and have done, what you can do.

Be sure and check the trade that interests you. Do it now.

COYNE SCHOOLS
Dept. 27, 39-51 E. Illinois St.
CHICAGO, ILL.



Please send me that big free book. I'm interested in:

YOU HAVE A BEAUTIFUL FACE
BUT YOUR NOSE?

IN THIS DAY AND AGE attention to your appearance is an absolute necessity if you expect to make the most out of life. Not only should you wish to appear as attractive as possible, for your own self-satisfaction, which is alone well worth your efforts, but you will find the world in general judging you greatly, if not wholly, by your *"looks,"* therefore it pays to "look your best" at all times.

Permit no one to see you looking otherwise: it will injure your welfare! Upon the impression you constantly make rests the failure or success of your life. Which is to be your ultimate destiny? My new *Nose-Shaper,* "TRADOS" (Model 24) corrects now ill-shaped noses without operation, quickly, safely and permanently. Is pleasant and does not interfere with one's daily occupation, being worn at night.

Write today for free booklet, which tells you how to correct ill-shaped noses without cost if not satisfactory

M. TRILETY, Face Specialist **1162 Ackerman Bldg., Binghamton, N. Y.**

INDEX to ELECTRICAL EXPERIMENTER SCIENCE & INVENTION

For Vol. 1, 2, 3, 4, 5

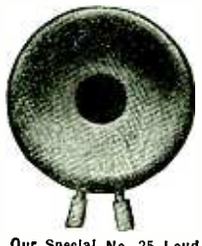
EXPERIMENTER PUBL. CO.
Book Dept. 231 Fulton St., N. Y.

AMPLIFY YOUR RADIO SIGNALS

With the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.

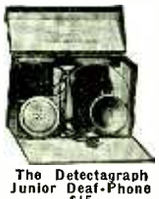


The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH-TRANSMITTER to the regular wireless receiver.

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter. It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

SUPER-SENSITIVE Detectagraph MICROPHONE DEVICES

Our Super-Sensitive Detectagraph Transmitter. Price, $7.00 Complete



Our Special No. 25 Loud Talking Receiver. Price, $4.00 Complete

Detectagraph Rheostat, especially made for amplifying circuits. Price, $2.00 Complete

Super-Sensitive No. 40 Receivers to be used in connection with Detectagraph-Transmitters, $10.00

The Detectagraph Junior Deaf-Phone $15

Equal to any $35 instrument made. Outfit consists of Super-Sensitive Transmitter with cord connector; Super-Sensitive Ear Piece with small black cord; Black Single Headband; Black Case and Two Batteries.

Model "B" Horn, with Loud Talking Receiver, Cord Plugs and Desk Stand Base. Price, $10.00 Complete

Model "C" Horn, with loud talking Receiver, Cord Plugs and Wall Base. Price, $10.00 Complete

Detectagraph $15

This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25-ft. Black Cord, Receiver, Headband, Case and Battery.

Order direct from ad.

DEPENDABLE KNAPP ELECTRIC SPECIALTIES

Motors and Electrical Specialties Are Best

Knapp Goods have stood the test for 29 years. No detail in construction has been spared to make them the best that money can buy. The complete Knapp line includes Toy and Power Motors, Generators and Dynamos. Specialties and Novelties that amuse and instruct. Fans, Rheostats, Compasses, etc. And Knapp prices are always lowest. Always insist on Knapp Goods.

KNAPP "LEARNELECTRICS"

A complete Electrical Laboratory, including a very valuable instruction book by H. P. Gorman, A.I.E.E. Covers all subjects clearly and concisely.

KNAPP DYNAMO MOTOR

Will electroplate, charge storage batteries, run lamps, motors, train of cars, induction coils,—in fact, the number of experiments it can be used for is unlimited. Runs on 4 to 6 Volts or can be connected to run on 110 Volts through a transformer.

Price, Complete, $7.00

Price, Complete, $3.50

Order to-day. Or your dealer can secure them for you. DESCRIPTIVE CIRCULAR and CATALOG of celebrated **KNAPP MOTORS** *and Electrical Specialties from 10c up mailed FREE on request.*

The Physics of "Tree Wireless."

We may regard the metallic electrode rigidly driven into the living organism of a tree, as described above, as a *potential earth-terminal* for the study of the potential distribution on the surface of the earth itself. It has been shown in these experiments that this metallic terminal intimately connected to the earth itself and a part thereof is subject to changes of potential representing the innumerable frequencies required by modern radio-telephony and telegraphy, as well as any other electrical disturbances which may occur on the surface of the earth or the atmosphere above the earth.

It has been also shown, as expected, *that we can select from this composite, one or more of the different frequencies by tuned electrical loop circuits suitably connected to this electrode and study each in turn,* at will, just as color screens can select a particular component of white light. We may, indeed, by means of a highly insulated conductor bring this terminal directly to the laboratory and connect it immediately to the modern thermionic tube and amplify almost at will the particular effects we are studying. This tube (Audion) is a powerful and new instrument of research for the modern physical laboratory. Has not the physicist therefore in this electrode a means of studying in detail atmospheric and earth electrical disturbances of absorbing interest and far-reaching importance?

In short, the radio Art as a whole has attracted some of the best equipt physicists in each country as perhaps no other practical engineering subject of recent years has done, with the result that the methods and means of the radio Art are now immediately applicable and available to the physical laboratory for the study of the fundamental problems of the earth itself as a charged sphere.

For four years, under the stimulus of the World War, the efforts of engineers have been expended in producing instrumentalities for the generation and reception of radio signals and there has been little time to coordinate and assimilate the information gained into a better understanding of the ether mechanism for the transmission of electromagnetic waves thru space, over the surface, or thru the earth itself.

However, from the moment an acorn is planted in fertile soil, it becomes a "detector" and a "receiver" of electromagnetic waves and the marvelous properties of this receiver, thru agencies at present entirely hidden from us are such as to vitalize the acorn and to produce in time the giant oak. In the power of multiplying plant cells, it may, indeed, be called an incomparable "amplifier."

From this angle of view, we may consider that trees have been pieces of electrical apparatus from their beginning and with their manifold chains of living cells are absorbers, conductors and radiators of the long electromagnetic waves as used in the radio Art.

For our present purpose we may consider, *therefore, a growing tree as a highly organized piece of living earth,* to be used in the same manner as we now use the earth as a universal conductor for telephony and telegraphy and other electrical purposes.

My Early "Tree Radio" Researches.

From the account of my early "Tree Wireless" experiments I quote the following selected paragraphs:*

*Reference. "On the Absorption of Electromagnetic Waves by Living Vegetable Organism." By George O. Squier, Ph.D., Major, Signal Corps, U. S. A. Official Report to the War Department on the Military Maneuvers in the Pacific Division, 1904.

WIRELESS MEN:

The Consolidated Radio Call Book

THE MOST NEEDED BOOK OF THE HOUR IS BEING published. A book which will be, literally, the right arm of all organizations and persons directly or indirectly connected with the ever increasing radio field

THIS BOOK HAS BEEN COMPILED AND IS PUBLISHED for the express purpose of meeting a timely and urgent necessity among radio and steamship companies, professional and amateur radio operators, and those having need of authentic and practical information on radio calls; radio, telegraph and cable rates, special signals and general radio procedure.

THE DAY HAS COME WHEN EFFICIENCY IS THE WATCHWORD in radio organizations, and this applies to the amateur as well as the professional. There is no room for guess work, either in the matter of call letters, rates or procedure.

EVERY VESSEL AND LAND STATION IN THE WORLD WILL BE represented and listed in this book alphabetically, according to names of vessels or land stations, and according to call letters; Revision of American coastal stations under U. S. Naval control, and their new calls.

THAT NEW AND GREAT AID TO NAVIGATION—THE RADIO COMPASS—will be explained and is a unique feature of this publication, and will be of special value to masters of merchant vessels.

THIS BOOK CONTAINS ALL CALLS LISTED IN THE NEW book to be published by the Department of Commerce.

PRICE IN ADVANCE OF START OF PRINTING 50c PER COPY. THIS OFFER good only when order is postmarked before July 1st, 1919. Price 75c after above date. Send checks or money orders. Act quickly as after supplying Commercial Wireless Companies with copies already ordered, individual orders will be filled in order of receipt.

CONSOLIDATED RADIO CALL BOOK COMPANY, INC.

41 Park Row, Room 1420, New York City

This book will also contain the advertisements of practically every company in the radio field.

Boys! You Can Make Your Own Electrical Apparatus with the aid of these wonderful books

Home-made Electrical Apparatus

By A. M. Powell

Three wonderful big books, chuck full of just the sort of information you have been looking for and at a price within reach of your pocket book. Each volume is printed on heavy paper, contains **75 pages and over 60 illustrations, complete working drawings for making every sort of electrical apparatus.** Written so you can understand them. **The price is only 25 cents per copy**—practically the cost of publication. See partial table of contents below and order now. The supply is limited.

Vol. I Contains *working drawings* and directions for making all sorts of Static Machines, Static Apparatus, Home-made Batteries, Storage Cells, Transformers, Rectifiers, etc.

Vol. II contains *working drawings* and directions for all sorts of Voltmeters, Ammeters, Galvanometers, Switches, Rheostats, Telegraph Keys, Sounders, Telephones, Shocking Coils, Spark Coils, Experiments, etc., etc.

Vol. III contains *working drawings* and directions for making all sorts of Dynamos, Motors, Electric Engines, Miniature Lighting Plants, Wireless Telegraph Apparatus, Tesla Coils, Wireless Telephone, Electroplating, Experiments, etc., etc.

Any of these wonderful books will be sent to you *postpaid* for **25 cents.**

Talking Thru the Trees

By Major General George O. Squier

(*Continued from page 272*)

"It would seem that living vegetation may play a more important part in electrical phenomena than has been generally supposed. We have seen that living vegetable organisms absorb and conduct electromagnetic oscillations over a wide range of the electromagnetic spectrum, beginning with sunlight, whose electrical action in the plant cell is at present little understood, and extending to waves of identical character, but of immensely greater lengths, such as Hertzian radiation, telephonic waves, and oscillations of the ordinary low frequencies used in commercial electric transmission lines. Disruptive discharges between vegetable electrodes, and electrostatic effects between vegetable surfaces are easily produced."

"In view of what has been accomplished in space telegraphy within the last seven or eight years, it is difficult to predict to what extent this means of communication may be ultimately developed. If, as indicated above in these experiments, the earth's surface is already generously provided with efficient antennae, which we have but to utilize for such communication, even over short distances, it is a fascinating thought to dwell upon in connection with the future development of the transmission of intelligence."

"Since a transmitting station is a central point for electromagnetic waves sent out in all directions over the surface of the earth, a large class of information, such as meteorological reports, crop reports, and general news items of interest to all, may in time be sent from central points, to be received at many places within the radius of influence of the signal station, and this, too, by the simplest forms of apparatus."

"It is seen that a growing tree, covered with foliage, is influenced inductively by electrical disturbances outside of itself, and in fact becomes generally responsive to induced electrical oscillations. It should offer, therefore, a promising means of studying meteorological effects of an electrical character, particularly those of lightning discharges, and electricity of the air. One of the first practical rules for the preservation of life against lightning is to avoid the vicinity of a tree."

"Our great forest areas may exercise an influence in maintaining a general equilibrium between the electrical charges of the upper atmosphere and the earth, which has not been fully realized. On this point, comparisons between observations from the interior of great desert areas devoid of any vegetation, with those from other portions of the earth's surface well covered with forests, would be instructive."

"From this viewpoint, the general surface of the earth may be considered as supplied by nature with innumerable meteorological observation towers, which possibly may be employed by means of apparatus involving principles already well known to science."

"In conclusion, it is believed that vegetation should be studied more systematically, from a distinctly physical standpoint than has been done in the past. Physics has been said to be the mother of all the sciences, and more and more the physical method of studying all science is proving to be the true one, as is evidenced by the great advance in recent years, in comparatively new branches of scientific work, such as Astrophysics and Physical Chemistry. Has not the time arrived for a more systematic study of Physical Botany, in the light of the new electric theory of matter?"

*Abstract of paper recently presented to Physical Society of America.

How Don Flashed the "S.O.S."

By Mabel M. Davis

(Continued from page 236)

flashed out: — - — - — — — - — — - — — - — - — - "Come pole."

In five minutes Will Merton was dancing excitedly about on the sidewalk below "Don," yelling to his brothers to bring the extension ladder. Other neighbors were gathering and demanding of "Don" why he was up there. "Don" glanced about and saw no sign of the cat he had come to rescue. When the wire flashed the cat had acquired a little common sense and gone down the way it came up. So that embarrassing element of the situation was, thank Heaven, eliminated. At the next call, "Donald Johnson, what are you doing up there?" Don replied, "Fixing the transformer. Bring up my supper, will you?"

Donald's father took his place at the bottom of the ladder, steadying it while Will Merton's older brother climbed up, unhooked "Don," and helped him get a place on the ladder. At the bottom he was besieged with questions but evaded them all. Will picked up Don's loaded coat and the hungry, shivering "S. O. S." man was glad to slip into it. All he said was: "Let's get out of this before the company's trouble man gets here to splice that wire."

When he got home he confest rather shamefacedly to his father and mother and Will Merton, that he went up the pole to rescue "A cat!"

"But I've learned my lesson. No more 'cat rescue' work for me. Of all the ungrateful creatures, that beast is the limit."

Donald's parents had to admit that this was an occasion where a practical knowledge of electricity was of some use. Several of the neighbors grumbled at being in the dark for an hour, but as soon as the lights flashed on again they forgave Donald for the inconvenience.

A SERIES-PARALLEL BATTERY SWITCH

(Continued from page 225)

in use, all switches should be left open.

A smaller switch for taking care of a larger number of cells may be constructed by following the general proportions outlined above; each additional switch will take care of one more cell of battery. A greater number of combinations are possible the greater the number of switches used.

Contributed by ERVIN J. TROJAN.

The Dollar Value of Draftsmanship

THERE are no "slack periods" for the trained draftsman—no limitations to his earning power—no drawbacks to his advancement to bigger things. Why? Because the manufacturer, builder, architect and engineer must have working blueprints before they can build factories, skyscrapers, railroads, machinery and homes. Drafting also has a positive dollar value to those engaged in all branches of engineering, because it qualifies them to direct those who can't make plans and read blueprints.

Be a Master Draftsman

Whether you want to be a professional draftsman, or add drafting to your knowledge of engineering, the American School course, specially prepared by noted experts for home study, will give you just the training you need. Drafting is the A B C of all engineering work. As you learn the practical working principles of Mathematics, Mechanics and Drawing, the broader field of engineering opens up to you. You are ready for a bigger job and better pay.

Read This Guarantee —Then Act!

"We guarantee at any time during the first year of your enrollment to refund the entire amount paid if, immediately upon the completion of ten examinations, you notify the School that you are not satisfied with your Course."

Electrical Oscillators

By Nikola Tesla

(*Continued from page 260*)

densers and operate an independent high frequency coil as customary. The controlling mechanism is of somewhat different construction but the core and contact spring are both adjustable as before.

Fig. 6 is a small instrument of this type, particularly intended for ozone production or sterilization. It is remarkably efficient for its size and can be connected either to a 110 or 220 volt circuit, direct or alternating, preferably the former.

In Fig. 7 is shown a photograph of a

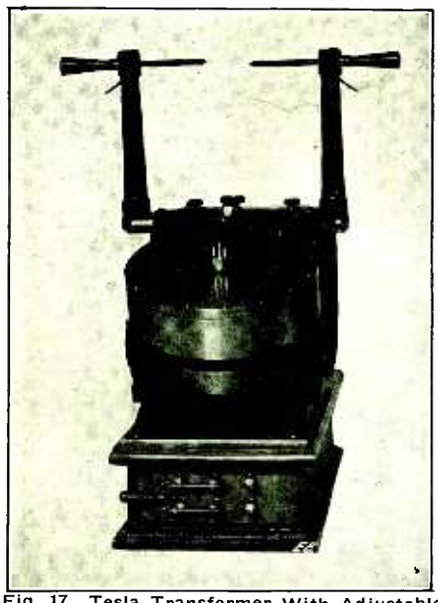

Fig. 17. Tesla Transformer With Adjustable Mercury Controller.

larger transformer of this kind. The construction and disposition of the parts is as before but there are two condensers in the box, one of which is connected in the circuit as in the previous cases, while the other is in shunt to the primary coil. In this manner currents of great volume are produced in the latter and the secondary effects are accordingly magnified. The introduction of an additional tuned circuit secures also other advantages but the adjustments are rendered more difficult and for this reason it is desirable to use such an instrument in the production of currents of a definite and unchanging frequency.

Fig. 8 illustrates a transformer with rotary break. There are two condensers of the same capacity in the box which can be connected in series or multiple. The charging inductances are in the form of two long spools upon which are supported the secondary terminals. A small direct current motor, the speed of which can be varied within wide limits, is employed to drive a specially constructed make and break. In other features the oscillator is like the one illustrated in Fig. 3 and its operation will be readily understood from the foregoing. This transformer was used in my wireless experiments and frequently also for lighting the laboratory by my vacuum tubes and was likewise exhibited at my lecture before the New York Academy of Sciences above mentioned.

Coming now to machines of the second class, Fig. 9 shows an oscillatory transformer comprising a condenser and charging inductance enclosed in a box, a transformer and a mercury circuit controller, the latter being of a construction described for the first time in my patent No. 609,251 of August 16, 1898. It consists of a motor driven hollow pulley containing a small quantity of mercury which is thrown outwardly against the walls of the vessel by centrifugal force and entrains a contact wheel which periodically closes and opens the condenser circuit. By means of adjusting screws above the pulley, the depth of immersion of the vanes and consequently, also, the duration of each contact can be varied at desire and thus the intensity of the effects and their character controlled. This form of break has given thoro satisfaction, working continuously with currents of from 20 to 25 amperes. The number of interruptions is usually from 500 to 1,000 per second but higher frequencies are practicable. The space occupied is about 10″ x 8″ x 10″ and the output approximately ½ K.W.

In the transformer just described the break is exposed to the atmosphere and a slow oxidation of the mercury takes place. This disadvantage is overcome in the instrument shown in Fig. 10, which consists of a perforated metal box containing the condenser and charging inductance and carrying on the top a motor driving the break, and a transformer. The mercury break is of a kind to be described and operates on the principle of a jet which establishes, intermittently, contact with a rotating wheel in the interior of the pulley. The stationary parts are supported in the vessel on a bar passing thru the long hollow shaft of the motor and a mercury seal is employed to effect hermetic closure of the chamber enclosing the circuit controller. The current is led into the interior of the pulley thru two sliding rings on the top which are in series with the condenser and primary. The exclusion of the oxygen is a decided improvement, the deterioration of the metal and attendant trouble being eliminated and perfect working conditions continuously maintained.

Fig. 11 is a photograph of a similar oscillator with hermetically inclosed mercury break. In this machine the stationary parts of the interrupter in the interior of the pulley were supported on a tube thru which was led an insulated wire connecting to one terminal of the break while the other was in contact with the vessel. The sliding rings were, in this manner, avoided and the construction simplified. The instrument was designed for oscillations of lower tension and frequency requiring primary currents of comparatively smaller amperage and was used to excite other resonant circuits.

Fig. 12 shows an improved form of oscillator of the kind described in Fig. 10, in which the supporting bar thru the hollow motor shaft was done away with, the device pumping the mercury being kept in position by gravity, as will be more fully explained with reference to another figure. Both the capacity of the condenser and primary turns were made variable with the view of producing oscillations of several frequencies.

Fig. 13 is a photographic view of another form of oscillatory transformer with hermetically sealed mercury interrupter, and Fig. 14 diagrams showing the circuit connections and arrangement of parts reproduced from my patent, No. 609,245, of August 16, 1898, describing this particular device. The condenser, inductance, transformer and circuit controller are disposed as before, but the latter is of different construction, which will be clear from an inspection of Fig. 14. The hollow pulley *a* is secured to a shaft *c* which is mounted in a vertical bearing passing thru the stationary field magnet *d* of the motor. In the interior of the vessel is supported, on frictionless bearings, a body *h* of magnetic material which is surrounded by a dome *b* in the center of a laminated iron ring, with pole pieces *oo* wound with energizing coils *p*. The ring is supported on four columns and, when magnetized, keeps the body *h* in position while the pulley is rotated. The latter is of steel, but the dome is preferably made of German silver burnt black by acid or nickeled. The body *h* carries a short tube *k* bent, as indicated, to catch the fluid as it is whirled around, and project it against the teeth of a wheel fastened to the pulley. This wheel is insulated and contact from it to the external circuit is established thru a mercury cup. As the pulley is rapidly rotated a jet of the fluid is thrown against the wheel, *thus making and breaking contact about* 1,000 *times per second.* The instrument works silently and, owing to the absence of all deteriorating agents, keeps continually clean and in perfect condition. The number of interruptions per second may be much greater, however, so as to make the currents suitable for wireless telephony and like purposes.

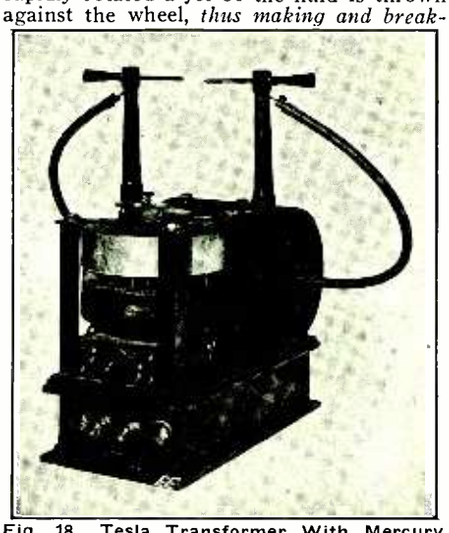

Fig. 18. Tesla Transformer With Mercury Jet Interrupter.

A modified form of oscillator is represented in Figs. 15 and 16, the former being a photographic view and the latter a diagrammatic illustration showing the arrangement of the interior parts of the controller. In this instance the shaft *b* carrying the vessel *a* is hollow and supports, in frictionless bearings, a spindle *j* to which is fastened a weight *k*. Insulated from the latter, but mechanically fixt to it, is a curved arm L upon which is supported, freely rotatable, a break-wheel with projections QQ. The wheel is in electrical connection with the external circuit thru a mercury cup and an insulated plug supported from the top of the pulley. Owing to the inclined position of the motor the weight *k* keeps the break-wheel in place by the force of gravity and as the pulley is rotated the circuit, including the condenser and primary coil of the transformer, is rapidly made and broken.

Fig. 17 shows a similar instrument in which, however, the make and break device is a jet of mercury impinging against an insulated toothed wheel carried on an insulated stud in the center of the cover of the pulley as shown. Connection to the condenser circuit is made by brushes bearing on this plug.

Fig. 18 is a photograph of another transformer with a mercury circuit controller of the wheel type, modified in some features on which it is unnecessary to dwell.

These are but a few of the oscillatory transformers I have perfected and constitute only a small part of my high frequency apparatus of which I hope to give a full description, when I shall have freed myself of pressing duties, at some future date.

The Kaiser is Canned--Can Food

By Grace T. Hadley

(*Continued from page* 219)

ples of jelly making and all the information is so clear that the work of canning and drying is no longer a mysterious problem but so simplified that school children may do it under the direction of competent teachers.

Methods of Drying.

For home drying satisfactory results are obtained by any one of three principal methods: Sun drying, drying by artificial heat and drying by air blast—using an electric fan, or other motor fan.

Sun drying has the double advantage of requiring no expense for fuel and of freedom from danger of overheating. For sun drying of vegetables and fruits, the simplest form is to spread the slices or pieces on sheets of thin paper or lengths of muslin nailed to strips of wood and expose them to the sun.

Trays should be used for large quantities. Sun drying requires bright hot days and a breeze. Once or twice a day the product should be turned or stirred and the dry pieces taken out. Care must be taken to provide protection from rain, dew and moths. During rains and just before sunset the products should be taken indoors for protection.

Drying by artificial heat is done in the oven or on top of a cookstove or range in trays suspended over the stove, or in the oven of an electric range. When drying with an artificial heat a thermometer must be used.

Air Blast—Electric Fan.

The use of an electric fan is an effective means of drying. Sliced vegetables or fruits are placed on trays and the fan placed close to one end of the box holding the trays, with the air current directed along the trays lengthwise. Insects must be kept out by the use of cheesecloth or similar material. Drying by this process may be done in 24 hours or less. As artificial heat is not used in fan drying, it is important to blanch or steam the vegetables for the full specified time. It is also necessary that all fan-dried products be heated in an oven to 180° F. for 10 or 15 minutes before storing.

Danger from Insects.

In addition to exercising great care to protect vegetables and fruits from insects during the drying process, precautions should be taken with the finished product to prevent the hatching of eggs that may have been deposited. One measure that is useful is to subject the dried material to a heat of 180° F. for from 5 to 10 minutes. By the application of this heat the eggs will be killed. Be careful not to apply heat long enough to damage the product. Store as soon as removed from oven.

Winter Use of Products.

In preparing dried vegetables and fruits for use, the first process is to restore the water which has been dried out of them. All dried foods require soaking. After soaking the dried products will have a better flavor if cooked in a *covered utensil*, at a *low temperature* for a *long time*. Dried products should be prepared and served as fresh products are prepared and served. They should be cooked in the water in which they have been soaked, as this utilizes all of the mineral salts which would otherwise be wasted.

That Wonderful Electric Action-Delayer

By Thomas Reed

(*Continued from page* 223)

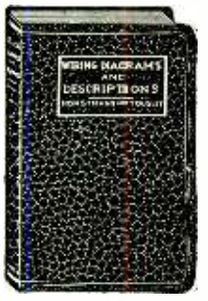
ripe cantaloupe for her, but that's neither here nor there.

How about the same kind of a lock on letter-boxes? They all ought to have 'em. Put a letter in, you can, but it won't go *way* in until two minutes after you've prest a button, so you have a chance to take it back. Why, in a few years that would save more trouble than all old Bill Hoho ever made. The time you forgot to enclose the money in the mail-order. The time you just knew you'd put 'em in the wrong envelopes—and did. The sarcastic letter you wrote your wife's mother, telling her where she got off—only the place wasn't where you said, it was on your neck. Oh say, Beiler's non-mailing letter-box. Well.

Beiler himself can elaborate his invention now, all he needs is to be told what good it is. Go to it then, Al, on the biggest thing of all. Fix your machine the opposite way, so it'll *stop* something and not *let go* for those two minutes, and apply that to an electric muzzle, lip-riveter, or throat-grabber; and when you die they'll put your monument right next to Dr. Munyon's, No. 11 Benefactors' Row.

It's easy, Al, a contact just under the chin, so whenever a fellow opened his mouth to talk, he'd be muzzled, gagged, choked—or go as far as you like, rendered unconscious—for two whole minutes. Why, a guy with that apparatus on his person wouldn't have trouble enough to keep his mind occupied. Never "getting in bad," never "starting anything," always ready with those witty retorts you think of afterward, no half-baked opinions, nothing but pure wisdom. Oh hum! And if you could get your wife to wear one, think of the deep silence as you wend your way upstairs at 2 A. M., with wifie at the top struggling to get the darned thing off. Two minutes yet before she can tell you what she thinks of the poker game, and the best "thinks" of all exploding inside of her, and lost, lost!

Well, Al, I can't go on like this, I must do a little inventing myself; but you get me, don't you, and you're under full headway with your future career, yes? I'll only suggest one little handy application more, one that should be in every home, the "Safety Bargain-Shopper".



It's a common shopping-bag, containing Beiler's device, a storage battery, and a pocketbook with an electric lock. Gwendolyn sees a bargain. Instantly her hand goes into the bag for her purse, but it's locked. She presses the button of Beiler's device. Have patience, Gwendolyn, dear, in a short two minutes that filmy thing of pink batiste (is batiste right?) marked down to 79 cents, is yours. But no, Beiler is on the job, and the 79 kaplunkos are spent for one pair of fat pork chops. Does Gwendolyn change her mind? Does or rather did she have a fit of economy, prudence, far-sighted wisdom? No! Within the two minutes she is pushed away from the bargain-counter by the seething, howling mob of five thousand other bargain snappers.

Fit Yourself for the Big Job

Don't hesitate any longer. There is a greater demand for trained men now than ever before — greater opportunities — bigger pay — more rapid advancement. It's training that counts now—accurate knowledge—a complete grasp of your trade.

RADIO FREQUENCY AMMETER

4 inch Face

0 to 3, 0 to 5 or 0 to 10 Amperes. Specify Reading Required.

$11.00 Net

The Jewell Electrical Instrument Co. is prepared to fill the instrument needs of the amateur experimenter in radio and general electrical work, as well as those who desire more precise and accurate measurements of electrical quantities.

We show above our high frequency ammeter, of the thermo couple type, especially desirable for medium sized installations.

For receiving panels, we are supplying small D. C. instruments for plate voltage and filament current, at a very reasonable price.

Write for our special radio instrument bulletin.

JEWELL ELECTRICAL INSTRUMENT CO.
1640 Walnut St. Chicago

"The Livest Catalog in America"

Our big, new electrical cyclopedia No. 20 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 180 Big Pages, 500 illustrations. 300 instruments and apparatus, etc. Big "Treatise on Wireless Telegraphy." 20 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. FREE Cyclopedia No. 20 measures 7x5¼". Weight ½ lb. Beautiful stiff covers.

WIRELESS

Send 6 cents in stamps or coin for which we will send our latest Cyclopedia Catalog No. 20 as described.

ELECTRO IMPORTING COMPANY
231 Fulton St., New York City

AMATEURS

Our type 5-A receiving set is ready for immediate shipment. Consists of double slide tuning coil, galena detector, 2 point switch, fixed condenser and binding posts for aerial, ground and receivers, mounted on quartered oak base. Price $4.50.
Unmounted coils, 10" long, 3" dia. each, 75c. (Wound with No. 24 enameled wire.) Radio message blanks, per pad, 35c. Tested galena crystals, each 15c.

McMAHON & ST. JOHN
56 West Ave., So. Norwalk, Conn.

$10.50

It's big value. Most selective, efficient tuner obtainable. Send 3-cent stamp for bulletin.

Colby's Telegraph School
Auburn N. Y.

AMPLIFICATION ON 180-2500 METERS

Do you know that we build a regenerative receiving set giving enormous amplification on from 180 to 2500 meters? If you want the best, better write for our catalogue. Enclose 2c stamp.

Universal Radio Manufacturing Corporation
Dept. W, Elmira, N. Y.

How to Build an Astatic Galvanometer

(*Continued from page 225*)

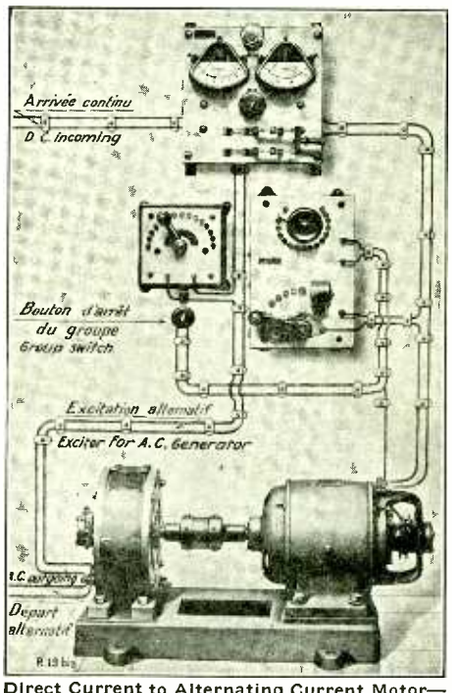
Next make a round base for your instrument. This, too may be turned on a lathe, but may as well be made of separate disks. Make one to fit inside the other end of the chimney, and make the other about half an inch larger all around. The second disk can conveniently be beveled. Fasten the two together. Make three wooden feet for your base, and fasten them on it, letting them make an angle with each other at the center of 120 degrees. In the ends of these feet, bore holes to receive the leveling screws. The screws themselves may be the binding screws from old dry cells. If now you cut a piece of fairly hard wood (hard rubber or fiber if you have it), which will fit around the base, and be attached to two of the feet, as the diagram shows, your base is complete. This piece of wood is to hold the three binding posts.

The two coils of wire (A) need cause little trouble. Form the bobbins of heavy card-board, or, better, from thin wood, held together with glue or shellac. The size of the bobbins naturally depends on the space available inside the glass cover. Wind them with wire varying in size according to the use for which the galvanometer is intended. If you wish it to detect extremely small currents, wind it with the finest wire you have (No. 40 B & S). Fasten the coils on the base in the manner shown, taking care that, when their windings are connected in series, the magnetic field of the two will be continuous. That is, let the wire be wound in the same direction in each. Connect them in series, and bring the two leads to the two end binding posts (C). Connect the middle binding post with the connection between the two coils. This allows the instrument considerable range. If you are working with very minute currents, let them flow thru both coils. If the currents are stronger, let them flow thru only one.

The astatic element is the next consideration. Cut a light piece of wood and push thru it two steel needles, of such length, and such a distance apart, that when the whole is suspended as shown, one of the needles will swing inside the coils, and the other just above them. Before pushing the needles thru the stick that is to support them, magnetize them thoroly. Assemble them so that the *north* pole of one and the *south* pole of the other will point in the same direction. The whole element should be made as light as possible, so that it may be suspended on a silk fiber or a silk thread. Now for the actual suspension. Make a cover for the top of the test tube (see the diagram) and thru this bore a hole large enough to allow a battery binding screw to slip freely thru it. Select a binding screw with a knurled thumb nut on it, and slip it thru the hole. To its end make fast the silk thread or fiber, passing it thru a small hole in the screw itself. Let the thread be approximately the right length before assembling the instrument. By holding the binding screw firm, and turning the thumb nut, the height of the astatic element may be regulated, while if the whole screw be turned, the magnets may be brought into their proper position with reference to the coils.

Now you have a good businesslike galvanometer. You can go further and elaborate it if you like. You can experiment with different size wire, different distances between coils, and with astatic elements of different weights. You can place a circular scale on the coils if you choose, and read the values off on it with the top needle as pointer. Or you can do this stunt: Mount a small mirror on the magnet support; next take a miniature bulb and cover the glass with a coat of white paint. Let this dry, then put on one or more coats of black, or some dark color. Support the bulb and its socket on a short piece of brass tubing, as shown, or on some other support of such height that if you scratch a hole in the paint on the side of the lamp, a ray of light will be reflected by the little mirror off onto a scale which you can hold at any distance. If you do include this feature in your galvanometer, you must add two more binding posts on the base to supply current to the lamp. This stunt works fine when the instrument is to be used merely for the detection of minute currents, but remember that the magnetic field of the lamp feed wires is going to complicate matters if the galvanometer is to be used for accurate measurements. It is needless to remind the reader that with the exception of the two (needle) magnets, no iron or steel should be used in the construction of this instrument.

Musical Radio Telegraphic Sets



By Jacques Boyer

(*Continued from page 233*)

by means of a regulating screw.

The sending helix offers some novel points. By means of metal sliders it is possible to vary the wave lengths instantaneously. Instead of using the usual antenna switch, a special commutator is used which might be of interest to American readers.

In the sending circuit, the tuning coil has only five contacts and an air condenser. The coupling can be changed in two directions, either in series with the antenna (for short wave lengths) or in parallel with the coupler (for long wave lengths). The secondary circuit, which is a periodic, has a coil, which is regulated by means of five

Direct Current to Alternating Current Motor—Generator Used in Radio Set of French Design.

contacts for the variation of the wave length. It has the usual connections with the head receivers, and there are two detectors used, each of which can be connected into circuit by means of a switch.

GREATEST TOY SENSATION OF THE DAY!

FIGHTING DREADNAUGHT

SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless. Can be operated indoors or out. Now boys! Here's your chance to see a battleship in action, and the best of it is you can OWN the ship and command the firing yourself! By having two or more Battleships you can arrange EXCITING NAVAL BATTLES in your own home. Price Warship and Ammunition, 15c, three for 40c, or a fleet of 1 ships for $1.50 postpaid. Extra Ammunition, 5 cents per pkg.

TOOTH-ACHE STOP

EASY TO USE

Stops the Pain; Stops the Tooth

Squeeze a little in hollow of tooth; the Ache Stops Instantly the paste hardens, forming an antiseptic Filling. Absolutely harmless. Have it ready for the next bad attack. 25c per tube, postpaid.

Mysterious Ghost

This is not a pretty object, but there is fun in it for people who like practical jokes. The Ghost, when displayed in perfectly dark place, glows with a ghastly cold bluish radiance that will cause a "creepy" sensation even when you know all about it, but a regular starter for those who come upon it unexpectedly. A great joke to play on your mother-in-law. Price only 15 cents each, or three for 40 cents.

"SAFETY 1st" PINS

A clever novelty. The National Safety First Movement has made them very popular. Wear one and show your sympathy with the movement. Also handy for wearing at amateur theatricals and the like. Two sizes, ¾ in. gold plated) and 1¼ in. (nickel-plated) 6c each, two for 10c p. pd.

INKLESS PEN

WRITES with WATER 600 words every time you dip. Makes its own ink. Writes fashionable violet color. Better and cheaper than fountain pens. Writes a long letter with one dip in plain water. No trouble—no bother—no muss. A pleasure to use. With Nickel Plated Reversible Holder 10 CENTS. 3 for 25c

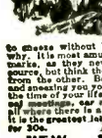
SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

Though so marvelously cheap, this machine is a thoroughly practical Typewriter. We positively guarantee it to produce writing equa in every respect to that of any $1.00 machine. It does not seem possible at the price, but—let us send you a specimen of the work and you will be convinced. With reasonable care it will last a lifetime. It is so simple that a child just able to read can operate it with it. You can learn all there is to know about it from five minutes' study, and an hour's practice will make you an expert operator. Every business man must have a typewriter. Legible pen writing is unbusinesslike and creates the impression that the firm is a no-account and slow-going concern. We assure you that the Practical Typewriter fully deserves its name and it will do for you the correspondence of any business or profession, and to do it well. You should not miss this chance of securing a bargain. The letters of the alphabet, the numerals 1 to 10, and punctuation marks are so grouped that the letters most used are before the operator most of the time, enabling him to write rapidly. The rollers hold the paper in position while writing and at the end of each line a slight turn of the rachet which makes a click and forces the paper forward, giving the proper line spacing, so that the lines are all an equal distance from each other, so desirable in letter writing. Each typewriter packed in a strong box, with full printed instructions for use. Price complete, $2.50 sent by mail postpaid.

Johnson Smith & Co., Dept. E 9, 3224 N. Halsted St., Chicago

SQUIRT RING



You may have a lot of fun with this Sparkling Gem Squirt Ring. It consists of a handsomely plated ring, attached to a rubber ball, so arranged that the latter is quite out of view when the ring is in the proper position. Such an attractive looking ring as this cannot fail to be the center of attraction. While the attention is absorbed in getting a closer view you just squeeze the rubber ball and the observer experiences a very great surprise. PRICE 10 CENTS. Three for 25 cents, postpaid. J. S. & CO

Wonderful X-Ray Tube

A wonderful little instrument producing optical illusions both surprising and startling. With it you can see what is apparently the bones of your arm, the lead in a lead pencil, the interior openings in a piece of wood, and many similar illusions. A mystery that no one has been able to satisfactorily explain. Price 10c each; 3 for 25 cents, 7 doz. 75 cents. Sent by mail, postpaid.

Sneezing Powder

Place a very small amount of this powder on the back of your hand and blow it into the air, and everyone in the room or car will begin to sneeze without knowing the reason why. It is most amusing to hear their remarks, as they never suspect the real source, but think they have caught it one from the other. Between the laughing and sneezing you yourself will be having the time of your life. For parties, social affairs, or any place at all where there is a gathering of people it is the greatest joke ever. Price 15c or 3 for 30c.

By Express Only

STAGE MONEY

With a bunch of these bills, it is easy for each person of limited means to appear prosperous. Having a roll of these bills at the proper time and peeling off a genuine bill or two from the outside of the roll, the effect created will be found to be all that can be desired. Prices, postpaid: 15 Bills 10c, 50 Bills 25c, 125 for 50c, or $3.50 thousand.

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

How Different Knots Are Made and What They Are Used For. How to Use and Knots to Avoid.

A most practical handbook giving complete and simple direction for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about wire rope attachments, lashing, blocks, tackles, etc. 37 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatmen. Price 10c p. pd.

Johnson Smith & Co., Dept. E9, CHICAGO

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night

The very latest discovery in the scientific world. Harmless, practically unobtainable except at an exorbitant price, we have at last succeeded in producing this remarkable LUMINOUS PAINT, which, applied to the surfaces of any article, emits rays of white light, rendering it perfectly visible in the dark. THE DARKER THE NIGHT, THE MORE BRILLIANT IT SHINES. Quite simple to use. Anyone—you can do it. A little applied to the dial of your watch or clock will enable you to tell the time by night. You can coat the push buttons or switch plates of your electric lights, match boxes, and innumerable other articles, and make your own Luminous Crucifixes, Lucifer Matches, etc. Bottle containing sufficient to coat several small articles. Price 25c. Larger sizes 50c and $1 postpaid. Johnson Smith & Co., Dept. E9,

MUSICAL KAZOO

With the Musical Kazoo you can, without previous practice whatsoever, play any tune right off, imitate any bird or animal, harpsichord, snare drum, Punch and Judy, etc. No holes to finger. It is simplicity itself. Produces excellent music. You do not blow into it, but sing, speak, laugh or make any desired imitation. Used with astonishing results at society meetings, home, club or church entertainments, dances, serenades, picnics, outings, excursions. Just the thing for choruses and shows, bicycle and marching clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. Price 15c. 2c. pd.

MAGIC FLUTE

Wonderfully Sweet Toned and Musical Instrument. No other instrument produces such sweet music, whether played on the lyrical notes of a quick-step or the solemn strains of a church hymn—in fact, any class of music can be played upon the Russian tone without practice, as it is almost a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

PRICE Complete ONLY $2.50 Postpaid anywhere Including Two Films

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the commonplace and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire its audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

JOHNSON SMITH & CO.

Dept. E 9 3224 N. HALSTED ST., CHICAGO

ANARCHIST BOMBS

Consists of a little glass vial, containing in liquid form a chemical which will produce most terrific odor. One dropped in a room full of people will cause more consternation than a dynamite bomb. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke; the intense discomfort of your victims is over everyone but themselves is thoroughly enjoyable. All that is necessary to produce the itching is to deposit a little of the powder on a person's hand and the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still some more. Sent only by express. (Must order at least One Dollar's worth of other merchandise.)

INVISIBLE INK

The most confidential messages can be written with this Ink. No one but the writing MAKES NO MARK. Cannot be seen unless you know the secret. Invaluable for many reasons. Keep your love affairs and other private memorandums away from prying eyes. Great fun for playing practical jokes. Only 15c Bottle

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ ONLY IN DARK ROOM; writing seems like fire. Quite invisible at daytime. Very remarkable. 15c bottle; 3 for 40c postpaid.

JOHNSON SMITH & CO.

MULTIPLYING BILLIARD BALLS

The Best Feat of its Kind

This trick is as effective as it is surprising. The performer hands around the ball for examination, and immediately it is returned to him he makes it by the tips of his thumbs and fingers and a second ball materializes, appears. The two are held in full view of the audience for a short time, and even while being placed in position, another ball unexpectedly appears. Final y the magician apparently suffers from some kind of spasm and yet another ball is the result. The feat can then be reversed, the balls disappearing one after another until none remains. It is a very interesting trick that is quite easily performed by following the directions that accompany the apparatus. PRICE, 25 CENTS. POSTPAID. JOHNSON SMITH & CO.

GOOD LUCK RING

Sealed and Never Open

A VERY striking and unusual ring, made of gunmetal. Skull and crossbones design, with two brilliant flashing gems sparkling out of the eyes. A never failing object of interest. It is said by many to bring Good Luck to the wearer, hence its name Good Luck Ring, and whether we will not positively guarantee that, it is certainly a very unique ring that you will take a pride in wearing. They were made to sell at 50 cents, but as a special bargain we will supply them to customers mentioning this paper, at HALF PRICE, viz., ONLY 25 CENTS. POSTPAID. JOHNSON SMITH & CO.

LOADED CIGARETTES

Just Like Ordinary Cigarettes, But Each Reel

A box containing ten apparently genuine Cigarettes. They contain a cap which explodes when about one-third smoked.

They appear so real, and afford so good a smoke, that they last that the victim is taken entirely by surprise. A great laugh producer and entirely harmless. Price, box of ten, 25 cents, postpaid.

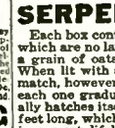
Johnson Smith & Co., Dept. E9

THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25

A per ect little typewriter for $1.25. There are many persons who would like to own a typewriter, but whose needs and business do not warrant the expense of a machine, and to such persons we confidently recommend our Little Giant. It is simple in construction, so that any one can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet most frequent y used being so grouped as to enable one to write rapidly, the numerals, 1 to 10, and the punctuation marks being together. With this machine you can send your best girl typewrit ten love letters, address envelopes, make out bills, and do almost any kind of work not requiring a large expensive machine. With each typewriter we send a tube of ink and full printed instructions for using the machine. Price complete $1.25 by express only.

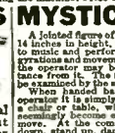
SERPENT'S EGGS



Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each one gradually hatches itself into a Snake several feet long, which curls and twists about in a most lifelike manner. Price per box 10c, postpaid. Johnson Smith & Co.

MYSTIC SKELETON

A jointed figure of a skeleton 14 inches in height, will dance to music and perform various gyrations and movements while the operator may be any distance from it. The figure may be examined by the spectators. When handed back to the operator it is simply placed on a chair or table, when it will seemingly become endowed with life, and begin to move. At the command of the master it will sit down, stand up, dance, etc. We send full direction with each Skeleton, by the aid of which anyone can readily make it perform. 10c postpaid.



CIGARETTE ROLLER

Very neat and handy. Weighs less than a quarter of an ounce. It makes better cigarettes than you can buy and makes them easily and quickly. You can use just the tobacco you prefer and thus have nicer "smokes" than ready-made, and more of them besides saving about half of your money. It will make your cigarettes just to your own liking. Price only 10c or 3 for 25c postpaid, with full instructions for use. JOHNSON SMITH & Co.

MIDGET ILLUSTRATED BIBLE

A Great Curiosity

The Smallest Bible in its World

The Midget Bible is a perfect piece of book work of art. It is about the size of a postage stamp and contains 240 PAGES AND FIFTY PAGES of the NEW TESTAMENT, profusely illustrated. This little Wonder will be said to bring good luck to the owner. Must be seen to be appreciated. Price, only 12 cents, three Bibles for 30 cents; one dozen Bibles sent for 100 for $2.00. Good money can be made selling these Midget Bibles amongst friends, church acquaintances, Sunday schools, bazaars, etc. Send for a few and try it.

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM

50c

It is great fun mystifying your friends. Get this Conjurer's Cabinet, and you will be the cleverest fellow in your district. It contains the apparatus for seven first-rate tricks, viz.: The Elusive Orange, The Disappearing Rose, that, when placed on the lapel of your coat, vanishes from sight as it will; the Magic Vase and Ball Trick, a Wooden Ball is placed inside, and upon replacing the lid has disappeared and is found in someone else's pocket. The Magic Nail with which you can apparently drive almost in two the Wonderful Card Trick (a card is placed in an envelope, and when opened an entirely different card altogether is found); The Disappearing Coin Box (a coin is placed in the little wooden barrel, and when opened again, is found to have vanished entirely; or can be made to change into a coin of another denomination); The Famous Mesmerized Penny that defies the law of gravitation; suspends from the palm of the hand, nose, cheek, wall, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). With the seven tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all the tricks to the great amusement of their friends or the public. Any boy of ordinary intelligence with this Cabinet of Tricks in his possession, can prove a great entertainer and become the equal of magicians. Besides the tricks contained in the Cabinet, there are twenty-five other feats and illusions fully explained with full printed instructions, for which you can easily make or procure the necessary apparatus. Among them are: The Mouse in a Pack of Cards, The Hat Trick, To Knock a Tumbler Through a Table, One Cent Robbed into Two, To Find the Number Thought of, Mysterious Wedding Ring etc. We also send the secrets of performing three wonderful stage tricks, as follows: The Vanishing Woman, Walking on the Ceiling of a Room, and the Disappearing Lady, together with an article on legerdemain and valuable hints to amateur conjurers. PRICE COMPLETE ONLY 50 CENTS.

JOHNSON SMITH & CO., Dept. E9, 3224 N. Halsted Street, CHICAGO

The Newest Novelty Aerial Balloon

Flies gracefully in or outdoors. This is the VERY LATEST SENSATION IN BALLOONS. A brightly colored balloon that measures sixteen inches long is blown up in the usual way and when released, the air pressure sends the balloon SOARING UPWARD, the 3½-inch propeller SPINNING AROUND AT A LIVELY RATE. The effect is startling. It is a graceful flier that makes the youngsters WILD WITH JOY. May be used repeatedly indoors or outdoors. As immensely interesting toy. Price 10c each, 3 for 25c ppd.

JOHNSON SMITH & CO., Dept. E9, 3224 N. Halsted Street, CHICAGO

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$5.50

Measures but 4¼ inches long

Takes regular .22 calibre cartridges

The new Baby Double Action Hammerless Revolver has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of Efficiency and Practicability. It is small in size, yet is just as effective and serviceable as the most expensive weapon you can buy. Every lady should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance, but it must be seen and used to be thoroughly appreciated. The ammunition used is the standard .22-calibre (short) cartridge obtainable anywhere, or you may obtain the cartridges from us (cartridges can be shipped only by express). The revolver fires six shots in one loading. The operation of the trigger and hammer is extremely rapid and absolutely reliable; six well aimed shots can be fired in as many seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of cylinder, and it weighs only 4½ ounces. The Price at the Factory Would be only $8.50, sent by mail postpaid to any address. JOHNSON SMITH & CO.

THE EXPO WATCH CAMERA

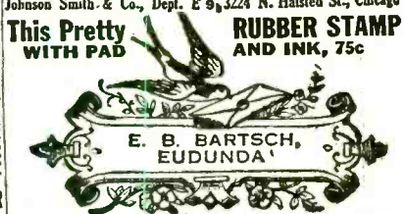
The most wonderful and ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the Expo about in your pocket and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing 25c, thus the picture taking part of a week's outing may be had for the nominal sum of 25c—One cent a picture. 10 Exposure Films also obtainable. Its simplicity itself to operate. Takes pictures through the stem, where the Rapid Fire Lens is located. The photos (0/8 x 7/8) may be enlarged to any size.

Price $2.50



QUICK AS A FLASH

Time and Instantaneous shutters; weighs but 8 ounces; nickel plated. Never changing style of this practical camera—in daily use by printing and developing of films just the same as ordinary cameras—in daily use by the police, newspaper reporters, detectives, and the general public. Improvements have been secured with the view of pleasing enterprising reporters. Produces clear, sharp negatives indoors or outdoors equal to any camera on the market, size or price notwithstanding.

Expo Watch Camera Postage 10c Anywhere $2.50 FILMS, 10 Exposures 15c, 25 Exposures, 25c Leather Pocket Carrying Case, 35c

Johnson Smith & Co., Dept. E 9, 3224 N. Halsted St., Chicago

This Pretty RUBBER STAMP WITH PAD AND INK, 75c

Here is the Prettiest rubber stamp you ever saw. At very great cost we have had this design specially engraved for our customers, and it cannot be obtained except through us. The design is ornamental, with floral decorations, with a beautiful dove in the upper part conveying its message of love, the desired name or name and address being tastefully displayed in the center. With this rubber stamp you can brand your letter paper, envelopes, postals and other stationery, and the elaborate and unique design will be admired by all. Placed upon the outside of envelopes, packages and other mail matter it ensures their return to the sender in the event of non-delivery for any reason. It looks very pretty stamped on books, music, photographs, etc. With each stamp we include a self-inking stamp pad and a bottle of ink for re-inking the pad, and the PRICE of the COMPLETE OUTFIT, in box, is ONLY 75 CENTS, POSTPAID.

Talking From 'Plane to Earth

(*Continued from page 203*)

ciated distinctly to them by Lieutenant Metcalf. They craned their necks to see the 'plane soaring far above bearing the officer, whose words came down to them so distinctly thru the ether.

A few minutes later Admiral Sims, from the platform, addressed the same audience *thru the amplifier*. He praised the work of the American Army in France, saying the navy was really an auxiliary of the army. More than 100 crippled soldiers from Walter Reed Military Hospital listened attentively to Admiral Sims' address and applauded his references to the navy, every word of which was distinctly heard, thanks to the remarkable amplifying properties of the new telephonic amplifier used on this occasion.

Billie Burke, the actress, sold bonds to the audience after the address of Admiral Sims, who bought the first bond.

All of which was made possible by the use of radiotelephony on the 'plane and at the ground station, coupled to the "Magnavox," a brand new telephone amplifier thru which the crowd in front of the Treasury heard President Wilson's Victory Loan appeal. Lieutenant Metcalf of the Military Aeronautic Service, delivered the message while flying 2,600 to 3,000 feet (about one-half mile) above their heads. Altho relayed at this great height, every word of the message could be distinctly heard.

The Magnavox (i. e. magnifying voice) is the invention of Messrs. D. S. Pridham, O. B. Moorehead and P. L. Jensen of San Francisco. It was connected with the airplane by means of the wireless telephone apparatus. One of the photos shows Mr. Pridham using the anti-noise transmitter speaking to the aviator.

The first question the layman naturally asks is: "How is it done?" The effect is wonderful, to be sure, yet it seems so simple. By the aid of the accompanying illustration the successive actions taking place in transmitting the aviator's voice from airplane to earth will be understood. The uninitiated are wont to think that, by some mysterious means or other the voice itself is actually projected thru the air, and that they are actually listening to the original speech. But such is not the case. The original vocal air waves set up in close proximity to the person speaking, in this case the aviator, are imprest on a sound-sensitive instrument, known as a *microphone*.

The microphone faithfully follows every intonation of the spoken voice and modulates or varies correspondingly a weak electric current passing thru the microphone, which modulations or variations of current are caused to affect in turn an audion or "talking bottle," as it is popularly called nowadays. The modulations of current in the microphone circuit are of low or audio frequency, about 1,000 cycles per second, and when these act upon the audion the electrical condition of the circuit connected with the antenna, which is in turn connected with the audion, causes oscillations or currents of high frequency of about 50,000 to 100,000 cycles per second, or higher, which are set up and pass into the antenna. The antennæ or aërial wires from which the radio frequency energy or waves radiate on the modern airplane provides for the use of two of these antennæ, one secured at either extreme of the wings. These wires are made of the toughest phosphor bronze strands, a large number of which are cabled together to give greater strength, and at the lower end of the antennæ, which may be 100 feet or more in length, there are placed lead weights weighing about two pounds. The airplanes arise and descend to and

Robinson Folding Bath Tub. Big seller. Costs little, no plumbing, little water. Weight 15 pounds, folds into small roll. Full length baths, far better than tin tubs. Guaranteed 10 years. $10 a day easily made. Write for free tub offer.

Robinson Cabinet Mfg. Co., 4981 Factories Bldg., Toledo, O.

STORAGE BATTERY TESTING

(*Continued from page 224*)

For example, a battery develops 100 amp. hours at the eight hour rate. At the five hour rate (see table) it will develop 86.5% or 86.5 amp. hours in a five hour discharge. Since amp. hours = amps. × hours, then 86.5 divided by five will = 17.3, the current in amperes that the battery will deliver for five hours.

The graphic curve, Fig. 3, showing the voltage of a pasted plate at the five hour rate will apply to any battery of pasted plates, discharged at the five hour rate.

When the battery is put on discharge readings should be taken at the following intervals: 0 hrs., ¼ hr., ½ hr., 1 hr., 2 hrs., 3 hrs., 3½ hrs., 4 hrs., 4½ hrs., 4¾ and 5 hrs. If the voltage should fall more than that shown in the curve between the 3 and 3½ hr. readings the voltage and cadmium readings should be taken at shorter intervals. When the cell voltage reaches 1.8 the pos. cadmium should read 2.00 volts and the negative about .20. Of course, these readings will vary somewhat, depending on the condition of the battery, but if the pos. cadmium falls below 1.9 volts or the negative rises above .25 it shows a lack of capacity in that group and the battery should be sent out for repairs.

A voltmeter reading on *open circuit* is of no value, since the voltage of a battery after standing a few hours is the same whether charged or discharged, approximately 2.1 volts.

Due to the fact that the *gravity* of the electrolyte changes with the temperature, the amateur very often spoils his battery in this way.

The following table will be of assistance in overcoming the above mentioned trouble. The standard temperature for all commercial testing is 70 deg. Fah.

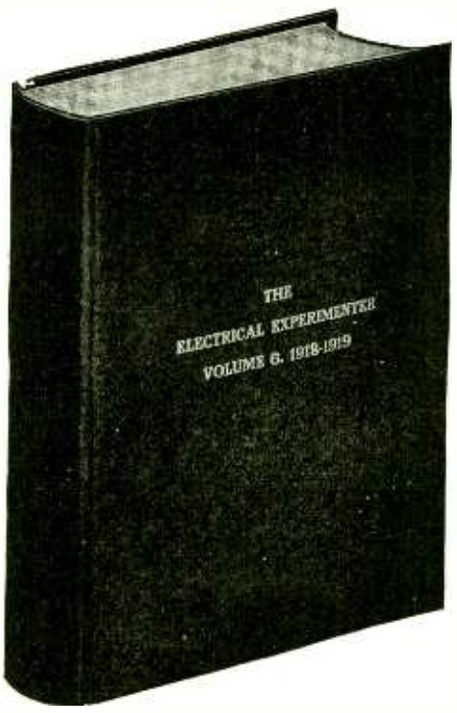

Table I

Degrees F.	Specific Gravity
100	1.275
97	1.276
94	1.277
91	1.278
88	1.279
85	1.280
82	1.281
79	1.282
76	1.283
73	1.284
70	1.285
67	1.286
64	1.287
61	1.288
58	1.289
55	1.290
52	1.291
49	1.292
46	1.293
43	1.294
40	1.295

The temperature of the battery should be kept as near 70 deg. as possible, as the capacity increases and decreases with the temperature. *A starting and lighting battery should not go above* 100 *deg. under any conditions. To do so will loosen the active material from the grids, and after a few cycles the battery will be completely ruined.* However, other batteries containing heavier plates will stand as high as 120 deg., depending on the thickness of the plates, but will be ruined if constantly operated at that temperature. It is therefore a good practise to always keep your battery below 100 deg. If it should be impossible to do this, the next best thing is to lower the specific gravity of the electrolyte.

RADIO ENGINEERS' MEETING.

The Institute of Radio Engineers held a meeting on Wednesday evening, May 7, at the Engineering Societies Building, New York City. A paper was presented on "The Detecting Efficiency of the Thermionic Detector," by Dr. H. J. van der Bijl, of the Western Electric Company. The paper presented described several different methods for measuring absolutely, or by comparison, the true detecting efficiency of vacuum tubes.

This Book Cost $34,000

1200 Authors Contributed

Our Bound Volume No. 6 contains a goldmine of electrical and scientific information. No such value has ever been offered before for so low a price. A marvelous cyclopedia of electricity. A reference book of authentic information not found in any other book in print.

Volume contains twelve numbers of the "Electrical Experimenter" magazine — May, 1918 to April, 1919, inclusive. There are 984 pages, 2,110 complete articles, 1,908 illustrations, 369 questions and answers. Sizes, 12" high; 9" wide; 2" thick.

A world of electrical information; the entire electrical Progress for one year; the greatest reference book on current "Wireless"—all at a price within reach of everybody. Mind you, the book is durably bound in attractive green linen with heavy covers. Letters stamped in gold. You will be proud to have it in your library. We have only 600 copies, therefore be sure and order to-day. Shipping weight 8 lbs. Add a sufficient amount for postage, otherwise we must ship by express.

$3.00

add postage for 8 lbs.

Positively the Greatest Electrical book bargain in the World. We ship AT ONCE. Order today to avoid delay.

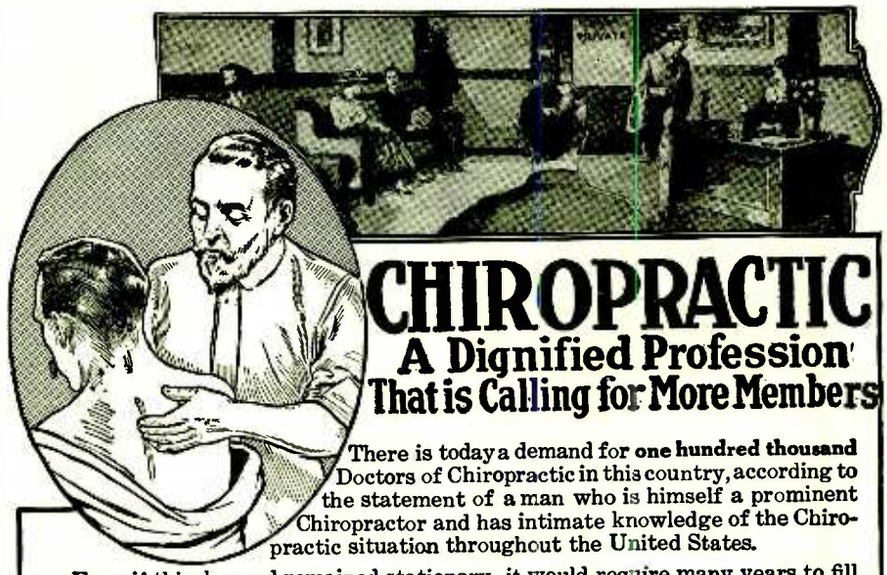
Talking From 'Plane to Earth



(*Continued from page* 281)

from the ground with these aërial wires outstretched. They need not be reeled up as was the previous practise.

Picking up the thread of transformations taking place in the voice from the airplane and by referring to the accompanying diagram-illustration, we see that the high frequency electric currents are shot off from the airplane antenna and proceed to set up electric oscillations or waves in the ether, *not in the air.* These waves radiate spherically in the same manner as the ripples on a small mill pond when you throw a stone into it—the ever-expanding ripples finally reaching the shore, and if a little float or tippet rests on the water it will be rocked by the wave when it reaches its position. The very same thing takes place when the aviator's voice, now transformed into extremely high frequency and inaudible waves, which may pass thru our very body or thru the building in which we may be; and these rapidly traveling waves, speeding onward with the velocity of light, or 186,000 miles per second, eventually reach the receiving antennæ, located in this case on the earth. These waves also move outward from the transmitting airplane station in all directions, and other stations may pick up the message or signals when desired, even at distances of 20 miles or more.

When in an extremely small fraction of a second the radio-telephone etheric waves reach the receiving antennæ, there are at once caused to be set up in the wires comprising these antennæ, minute electric currents corresponding in frequency to the etheric waves of, let us say, 100,000 cycles per second, which are, of course, *inaudible.* This receiving antenna, in the present instance located on the Treasury Building at Washington, D. C., was connected up with a sensitive wireless telephone receiving set, in which we find some more audions, or "talking bottles." In this case the audions or vacuum tubes containing the various electrodes for controlling the stream of electrons or minute electric charges passing thru the audion, are used inversely to their action in the airplane as described above—here they have imprest upon them the *inaudible* radio-frequency oscillations or currents coming to them from the receiving antenna and set up in the manner aforementioned. Of course, these oscillatory currents are carefully tuned by means of the usual tuning coils and metal plate condensers, so that the message comes in with maximum *resonance.* The audions transform these antenna currents into *audi-frequency* currents, which may be then past into an ordinary pair of wireless telephone receivers strapt to the head, or as in the present case, they may be past into a *sound amplifying apparatus.*

An amplifier of this type and suitable for powerfully intensifying wireless telephone or telegraph messages as well as the regular telephonic speech over the usual telephone circuits from Washington to New York, etc., is shown in the accompanying photographs and is known as the *Magnavox.* This instrument comprises a diafram and electromagnet very cleverly arranged and delicately balanced, so that when a medium strength telephone or radio current passes into it, the diafram or sound reproducer of the device responds with greatly intensified effect, and in this way it proves a wonderful advance for the purpose of public speaking, amplifying radio signals under certain conditions where more than one may wish to hear them, such as in lectures, and for a hundred and one other requirements, including train announcing, theatrical purposes, ad infinitum.

CHIROPRACTIC
A Dignified Profession That is Calling for More Members

There is today a demand for **one hundred thousand** Doctors of Chiropractic in this country, according to the statement of a man who is himself a prominent Chiropractor and has intimate knowledge of the Chiropractic situation throughout the United States.

Even if this demand remained stationary, it would require many years to fill it. But the demand is constantly increasing because more and more intelligent people—those who do their own thinking—are becoming convinced that Chiropractic (the advanced Science of Spinal adjustment) is the common sense and really scientific way to relieve pain and disease.

A Real Opportunity

Do you realize what this means to you if you are really ambitious? It means that never has there been a more opportune time for you to align yourself with the members of a great profession that is forging rapidly to the front. Today Chiropractic is receiving the serious consideration and hearty endorsement of even many doctors of the old schools of medicine, of clergymen and of large numbers of scientific thinkers and investigators. And Chiropractic is a profession of rich financial rewards.

$3000 to $5000 a Year

Many Doctors of Chiropractic earn that much and more. Some upwards of $10,000. Dr. M. D. Moore, of Kentucky, reports an income of $9,000 a year. Dr. L. H. Roche, New Jersey, $5,000. Dr. Hanna, of Florida, over $5,000 yearly.

The success of Chiropractors, in many cases, has come so quickly as to be almost startling. And yet, it is not to be wondered at when you consider the scientific accuracy of Chiropractic methods and the comparatively few Chiropractors that are now in the field.

Become a Doctor of Chiropractic In Spare Time AT HOME

The American University method enables you to study by mail or in class and obtain a complete mastery of Chiropractic in the shortest time consistent with thoroughness, while you hold your present position. Easy terms. A splendid faculty will personally instruct you in the basic principles and in the most approved methods of relieving Headache, Indigestion, Lumbago, Epilepsy, Pleurisy, Constipation, Rheumatism, Asthma, Neuralgia, Neuritis, Catarrh, Fevers, Jaundice, Dyspepsia, Paralysis, etc. No special preliminary study is needed. You graduate with the degree of Doctor of Chiropractic and are ready at once to open your office.

22 Charts Free!
Send Coupon

We have prepared 22 remarkable Anatomical and Pain Area and other Charts—a total value of $31.50. Our special offer places all of these 22 Charts FREE in the hands of ambitious men and women. We will send all particulars and our 72-page book free on request.

We know what the opportunities are and we see no reason why you should not "cash in" on these opportunities just as fully as others have done and are doing. A postal or the coupon will bring complete information about course, easy payment plan and the Free Charts offer.

CARNOTITE

(Radium Mineral.) The American Pitchblende found in Colorado, from which *Radium* is extracted.

A generous piece, enough to conduct experiments, such as affecting photographic plates thru opaque material (similar to X-Ray pictures), first made by Sir W. Crookes and Mme. Curie, is furnished in neat, wooden box.

URANIUM ORE (*Radio-Active*)

Containing about 35% of pure Uranium; also Radium and Vanadium. One of the most rare and interesting minerals. Twenty milligrams are furnished in glass vial protected by lead cover.

One box of *Carnotite* and one vial of *Uranium Ore* as described above $0.50 sent prepaid.

Automobile Accessories.

Save Money. It is a conservative estimate that 75% of the money spent for tires is wasted. One bad blowout or rim cut means a tire cast aside. This problem has been overcome by the new McDaniel Process, which gives 5,000 more miles out of old tires. The cost is insignificant compared to the many dollars saved. Drop us a card today and let us send full details. We want to tell you how to double your tire mileage. Leo McDaniel Rubber Co., 806 Commercial Ave., Cairo, Ill.

Ford Car Repair Book sent free. This valuable, complete, well illustrated, book explains in a simple way the Causes and Cures of Overheating; Repairing Ford Timer; Curing Piston Ring Troubles; Carburetor Adjustment and Repairs; Connecting Rods; Transmission Troubles; Care and Repair of Rear Axle; Stopping Axle Grease Leaks; also covers practically every other phase of Ford car repairing. Another feature is a chart showing exactly how much to pay for work done by repair men. Send 25c. coin for three months' trial subscription and get the valuable repair book free. Ford Owners' Magazine, 417 Montgomery Bldg., Milwaukee, Wis.

Ford Owners are discarding all light devices for "Slow Speed Bright Lights." Retail $1. 300% profit. Guy Cox, Golden, Ill.

Auto Motors and Supplies. Buick, Hupp, Franklin, Michigan, Everett, Hudson, Chalmers. Both water and air cooled motors, $40 each and up. Bosch Magnetos, $15 each and up. Presto Tanks, $5. Coils, Carburetors, Head Lamps, Horns, Air Compressors, Generators, Starters. Write for bargain bulletin second-hand auto accessories. Johnston, West End, Pittsburgh, Pa.

Fords run 34 miles per gallon with our 1919 carburetors. Use cheapest gasoline or half kerosene. Start easy any weather. Increased power. Styles for all motors. Runs slow high gear. Attach yourself. Big profits for agents. Money back guarantee, 30 days' trial. Air-Friction Carburetor Co., 270 Madison St., Dayton, O.

Tools.

Welding Outfits for all purposes. Get our prices before buying elsewhere. Fesco Mfg. Co., Sutherlin, Ore.

Personal.

Are You Self-Conscious, embarrassed in company, lacking in self-control? These troubles overcome. C. E. Veritas, 1400 Broadway, New York City, N. Y.

Music.

"American Girl" and 4 big song hits, 50c guaranteed. Magbee Co., 403 13th Ave., Columbus, Ohio.

Wireless.

Complete Receiving Sets $8.50, $9.50 and up. Instruments, parts, minerals. Circular for stamp. Inquiries invited. Jenkins, 923 Purchase St., New Bedford, Mass.

Radio Apparatus of Quality. Manufactured to your own specifications. Radio Engineering Company, Baltimore, Md.

Primaries and Secondaries for loose couplers $2.50 per set. Complete instrument $4.50. Coil for tuner $1.50. Complete $2.50. Goods prepaid. Leon Pennell, 75 Ellsworth St., Brockton, Mass.

Amateurs! Attention! Have you received our Weekly Bargain Bulletin? If not, write now! All Standard Apparatus at prices that cannot be duplicated. Special rates to radio clubs. Modern Radio Equipment Co., 27 So. Broad St., Elizabeth, N. J.

Amateurs! Special seamless cardboard tubing for receiving transformers. 5" and 5½" outside diameter, 25c. per foot, 6" diameter, 30c. Any length. Maier & Co., 335 E. 93rd St., New York.

Wireless Apparatus. Detectors, couplers, phones, aerial wire, brass and copper strip, switch points, knobs, bakelite. List 3c. Klaus, Eureka, Ill.

Switch Points. Binding posts, switch levers, and small parts, send 2c. for catalogue describing these and other goods. A. W. Bowman & Co., 23 Church St. (Harvard Square), Cambridge, Mass.

Agents Wanted.

Insyde Tyres, inner armor for automobile tires, double mileage and prevent punctures and blow-out. Quickly applied. Costs little. Demand tremendous. Profits unlimited. Details free. American Automobile Accessories Co., Dept. 54, Cincinnati, O.

10 to $25 a day profit. Biggest summer seller. Concentrated fruit drinks. Just add water. Delicious drink in a jiffy. Six popular flavors. Bestever Products Co., 2426-SE-7, Polk St., Chicago.

Agents. Toledo Inventor makes wonderful discovery. Puzzles, yet pleases auto world; next to gasoline most needed, fastest selling auto accessory in world; one man sold 10 gross first month; wonderful chemical cloth works like magic; one rub over rain or snow blurred windshield, street car or locomotive window, presto! glass stays clear 24 hours; can't blur; exclusive territory free—worth fortune. Security Mfg. Co., Dept. 146, Toledo, O.

Big Money Made every day selling our automobile accessories. Every autoist a customer. Most remarkable inventions in the accessory line. Demonstration proves every claim. Particulars free. Exclusive territory if you act quick. The Embee Co., Wilkinsburg, Pa.

Install Farm Lighting and Power Plants. Our exclusive agency and special demonstrating offer insure big profits at a small investment. Get our plans at once. Acme Engineering Co., Louisville, Ky.

Beginners. Complete "Mail Order System." C, Box 1005, Atlantic City.

Agents. Big returns, fast office sellers; particulars and samples free. One Dip Pen Co., 12 Daily Record Bldg., Baltimore, Md.

$10 Daily refinishing chandeliers, brass beds, automobiles by new method, without capital or experience. Free particulars and proofs. Write today. Gunmetal Co., Ave. D, Decatur, Ill.

Signs for store and office windows. $50 a week easily made. Chicago Sign System, G 326 River St., Chicago.

Printing.

Gummed Labels! Rubber Stamps! Samples Free! Edward Harrison, "Printing," Baltimore.

100 Engraved style visiting cards, 50c.; 100 emblem cards, 70c. H. Gregory, Warwick, N. Y.

200 Bond Note Heads $1. Money back guarantee. Ferndale Printery, Cherrydale, Va.

Motors, Engines & Dynamos.

Gas Engines. Marine, stationary and cycle motors for bicycle attachment, rebuilt and guaranteed. Don't fail to get our price list before buying. Prices 50% lower than others. Write. United Motor Repair & Supply Company, 305-309 Broadway, New York.

Gasoline Engine. ¾ horse. Set of castings $8. 4 Horse $15. Send 12c. for blueprints. Speed lathe castings $1.85, blueprints 12c. M. & J. Specialty Co., 252 Parke St., Pontiac, Mich.

Small Motors and Generators from bankruptcy and receivers' sales. Motors for all phases of current. Immediate delivery. Less than one-half regular prices. See display ad on page 259. Johnston, West End, Pittsburgh, Pa.

For the Hair.

I Was Bald. Obtained hair growth by an Indian's ointment containing genuine bear oil and rare plant juices. Many others have good hair-growing results. Will send box, postpaid, with recipe, 10c. John Hart Brittain, 150 E. 32nd St., BA-300, New York.

Postcards.

Join the Largest post card exchange in the world. Members everywhere. Membership 15c. 3 months 25c. "Wide World," Box 532, E, New Glasgow, Nova Scotia, Canada.

Join a Post Card Club. Have friends everywhere. Membership 10 cents. John Miller, 1430 H Street, Sacramento, Calif.

Five Prettiest Woman Cards. Hand colored, 25c.; camera bargain list free. Chas. Durso, Dept. 41, 25 Mulberry St., New York City.

Exchange Ads.

Standard Type Corona and Case. Perfect condition. Want 1 KW Thordarson and rotary or other apparatus of equal value. Harry Wright, Fire Island Radio Station, Bayshore, N. Y.

Wanted. Used motorcycle engine, preferably a twin. George Weitz, Boonville, Mo.

3000 Meter Coupler, Tron Bulb. Bargain. L. B. Wilcox, 113 E. 6th, Erie, Pa.

Attention! We have something you want! See our advertisement in main columns. Tabulated Information Card Co.

Sell. Complete receiving set and 5-dial omnigraph. E. Schuessler, 2209 Wheeler St., Cincinnati, O.

Selling My Amateur Wireless. Bargains. "Wireless," Str. Huron, Marine Post Office, Detroit.

Trade. 3-inch spark coil for good phones, audion bulb or loose coupler. Roy Schilling, 2476 W. 29th St., Denver, Colo.

For Sale. ¾ kilowatt transmitter and regenerative receiver, perfect condition. Myrl Priest, St. James, Minn.

For Sale. Official Boy Scout supplies. Send for list. Carl B. Mayo, Orleans, Mass.

Regenerative Cabinet Receiver. Other wireless, electrical and chemical apparatus. Send stamp and state wants. Ray Keogh, 328 Larel Ave., Chicago.

Radio Apparatus for Sale. Receivers, condensers, sending keys, switches, storage batteries, wall telephones, high frequency apparatus, etc. Send for list. George Holmes, 164 W. 146th St., New York City.

For Sale. Wavemeter 100 to 20,000 meters, $25. List of other apparatus for stamp. Gebhard, 1127 Ellicott St., Buffalo, N. Y.

For Sale. New cyclopedia of applied electricity, $16. Claude Grace, Princeton, Ind.

Practically Giving Away wireless instruments amounting $100. List for stamped envelope. Fliegel, 4535 N. 17th St., Philadelphia, Pa.

Sell or Swap wireless apparatus and little of everything else. Send for list. All inquiries answered. Ellsworth Erickson, 3005 Cedar Ave., Minneapolis, Minn.

For Sale. Correspondence course in wireless. Earl C. Brown, Martinsburg, W. Va.

For Sale. Experimental chemical lahoratory. Bert Emerson, 704 N. Haydon St., Hannibal, Mo.

Sell. New 5-record Morse omnigraph, key, sounder, $12. Wm. Ericksen, Exchange Bank, Spokane, Wash.

For Sale. Mignon R. L. C. 5 receiving cabinet. Fine condition, wave length, 9,000 meters. Price $30, or will exchange for Paragon regenerative in good condition. Enclose stamp. Harold Smith, Charleroi, Pa.

Typewriter. Oliver and Royal. First class condition. Your choice $25. Emerson Tanner, West Vine St., Canton, Ill.

For Sale. Complete transmitting set, 3 in. receiving apparatus and electrical supplies. Heiges, Wheatland, Pa.

Sacrifice $300 worth Radio and high frequency apparatus all new. Write for description. G. Dunfee, Shenandoah, Iowa.

Must Sell. Send stamp for list electrical books, chemicals, microscope, cameras, phonograph records, etc. T. H. Blacknall, Raleigh, N. C.

Exchange, Buy, Sell. Wireless, electrical goods, etc. Large list 6c. State what you have and want. Zehrbach, Box 500, Hiram, O.

Kodak No. 1-A. Like new with film. Eight dollars. Edward Wilson, Spangler, Pa.

Typewriter. Like new. For sale or exchange. John Galhreath, Rogers, O.

For Sale. Blueprints for connecting A. C. motors. See ad under "Blueprints." Charles L. Chittenden.

Wanted. Electrical or mechanical instrument that will locate buried treasure, from three to five feet underground. I. A. Blalock, 614 Parker St., Jacksonville, Fla.

Exchange Ads (Cont'd)

For Sale or Exchange. 8 H.P. kerosene engine, dynamos, motors, magnetos, switchboard meters, musical instrument and a lot of other things, for list and particulars write at once. F. J. Bretzke, Brownsville, Wis.

Sell or Trade—Toward good wireless receiving apparatus, Westinghouse A. C. ammeter 0-200 amperes and busbar. Ladies' violin, $45. Duncan Eader, Shelby, Mich.

For Sale—Apex Electric Cleaner $43. Never been used. Edw. Juselius, Safepack, Millis, Mass.

For Sale—1 gasoline engine, 4 h.p. complete with new coil plug, piping and tank $19 also 6-100 storage battery $15 and 4-40 storage battery $6.50. Write for list of electrical things. Herman Silber, 166 S. 3rd St., Brooklyn, N. Y.

For Sale—Grebe, DeForest, General Radio and other apparatus. Please enclose stamp. Natalish, 68 West 56th Street, New York City.

For Sale—Clapp-Eastman type E, 5 K. W. transformer, slightly damaged, $100.00. K. M. Briggs, 26 Albemarle St., Rochester, N. Y.

Motion Picture Plays.

Photoplays Wanted. Big prices paid. You can write them. We show you how. Free particulars. Rex Publishers, Box 175, E-3, Chicago.

Blue Prints

Blue Prints. ½ H. P. gas engine, 30c.; ¼ H. P. steam engine, 50c.; ⅛ H. P. boiler and engine, 70c.; all 3 for $1. Circulars on castings and engines for stamp. Universal Gas Motor Co., 364 Monadnock, Chicago.

Blue Prints, 236 A. C. diagrams, 2 to 12 poles, contains 54 single phase, 42 two phase, 50 three phase Star, 40 Delta, 12 Star-Delta. Appendix 38, changes of voltage, phases, speed, cycles etc. Easily understood. Price reasonable. Terms. Write for particulars, or send 25c. for 10 full size samples. Charles L. Chittenden, 811 West 18th St., Kansas City, Mo.

Salesmen Wanted.

House-to-House Salesmen, why not the line that sells and repeats every 90 days? Our Sanitary brushes, mops and dusters pay big commissions, and we protect you in good territory. Only live ones wanted. Early promotion for producers. If you know and admit that you're good, write us. North Ridge Brush Company, 114 Clark Ave., Freeport, Ill.

Stammering.

St-Stu-t-t-tering and Stammering cured at home. Instructive booklet free. Walter McDonnell, 105 Potomac Bank Bldg., Washington, D. C.

The Pliotron Oscillator

By William C. White

(*Continued from page 232*)

maximum value of about 2.5 milli-henries. They should preferably be of the variometer type, continuously variable in the range 0.5 to 2.5, altho a variation by a dozen to fifteen steps is fairly satisfactory.

The object of having L_4 variable is for the purpose of applying the high-frequency energy from the pliotron to the resonance circuit at the correct voltage, so that the energy available is used most advantageously in the resistance of this circuit.

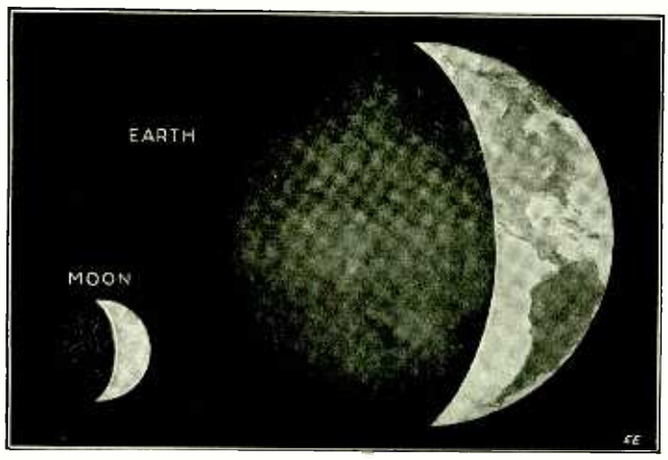
The inductance L_3 is made variable so as to supply to the grid just the right amount of high-frequency energy to make the system self-exciting and to excite it in the most efficient manner.

As in the case of the arrangement for heavy currents, a suitable range of potential for the direct-current source is from 200 to 750 volts.

With such values of inductance and capacity that a frequency of 100,000 cycles is obtained, a voltage of 12,000 may be produced from one pliotron tube operating from a direct-current source of 500 volts.

Pliotron tubes may be operated in parallel for the production of a voltage higher than that obtainable from a single tube.—*Photo Courtesy G. E. Co.*

BATTERIES LIGHT HOUSES IN SWEDEN.



A recent fair held in Sweden brought out the shortage of oil and the many substitutes and methods of economy displayed. The efforts of the lighting industry to find a substitute for the kerosene lamp were shown at the fair in the form of carbid lamps for use in places where there is no electric current—a battery lamp called the "Mercal," and also the Jungner primary elements intended for the electric lighting of entire buildings.

This Is How We Look in Arabic

(٢٣٥) الروضة

بسهولة من سكان الزهرة بمساعدة التلسكوب الذي نستعمله نحن هنا لرصد السيارات

فمتى كان المريخ في مركز مناسب للرصد عن الارض يكون قطر الدائرة من قرصه ما بين خمسة عشر او خمسة وعشرون ثانية من القوس حسب تعديل مسافته عن الارض في اوقات الرصد وعندما تكون الارض بنقطة موافقة لرصدها من الزهرة فقطر دائرة قرصها يكون ثلاثة وستون ثانية من القوس وقطر دائرة القمر سبعة عشر ثانية من القوس وحتى ان قرص القمر الذي نراه فانه يبان للزهرة في اوقات خصوصية اكبر مما يبان قرص المريخ

(الرسم الرابع)

هذا الرسم يظهر هيئة الارض كما تبان للمريخ في وقت لمعانها وهي بهيئة هلال ولزيادة التوضيح انظر شكل ٢ وه فالارض لا تظهر لسكان المريخ الا كما هي ظاهرة في هذا الرسم اي هلال ومتى اضيئت بنور الشمس تختفي ولا تعود تظهر للمريخيين

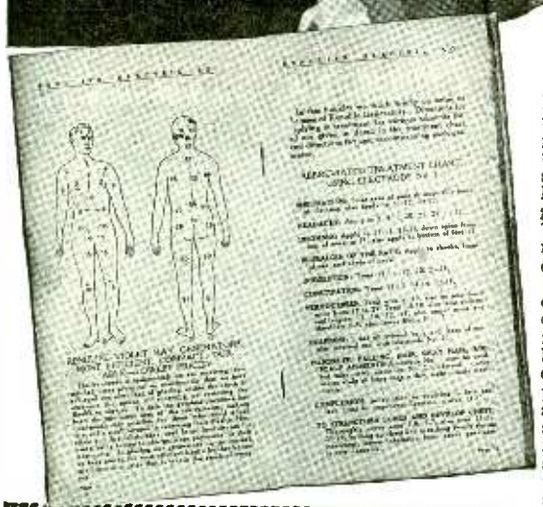
DON'T FOOL WITH PHYSIC

STRONGFORT
The Perfect Man

Don't try to doctor yourself back to health and strength with so-called "remedies" for constipation, biliousness, loss of manhood or any other chronic ailment or weakness. **It can't be done.** No real MAN was ever made by anything that came out of a bottle—booze or any kind of patented "restorative." Look the facts squarely in the face; **You can't go on indefinitely,** if you feel like a wreck each morning and want a bracer before you go to work; you can't get anywhere in your business or profession if the poison from constipation is infecting your vital organs and beclouding your brain; you can't win out if any chronic ailment or weakness has a grip on you.

God made you and God made Nature—and Nature is the only doctor who can restore your vitality if it is gone; it makes no difference whether it was lost through overwork or worry or illness, or wasted away in errors and indiscretions of your own.

STRONGFORTISM IS NATURE'S WAY



Strongfortism is simply taking advantage of the marvelous power of recuperation implanted by Nature in every human organism; the force that healed frightful wounds in France, when surgeons simply helped Nature to do the work; the power that has made strong, healthy, vigorous men out of thousands of my pupils, who came to me, many of them, broken down human derelicts, hopeless that anything could ever restore their lost virility. Learn about this wonderful force within yourself; you can't afford not to know about it. Send for my FREE BOOK, **"PROMOTION AND CONSERVATION OF HEALTH, STRENGTH AND MENTAL ENERGY."** It will tell you how Strongfortism will enable you to COME BACK; how to improve yourself 100 per cent—I GUARANTEE IT. Send 3 2c stamps to cover postage and packing and I will mail you a copy at once.

TREAT YOURSELF With The Wonderful *Health Restorer* VIOLET RAY

Now made simple and perfectly safe

You Can Have Bodily Vigor, Success-Attaining Energy, Attractive, Healthful Beauty

All at practically no cost—The great benefits of the ***Violet Ray treatments*** heretofore only procurable at big expense from physicians and beauty specialists are now available in your own home. Look over list of treatments below. Send for particulars.

How Violet Ray Benefits

Electricity from your light socket is transformed into health and beauty-giving Violet Ray—powerfully effective, yet gentle, soothing, perfectly safe. Voltage is raised from ordinary lighting current to *thousands of volts*, giving tremendous penetrative force. The irresistible, revitalizing powers of *Renulife Violet Ray* are carried at once to every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions restored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep-seated cause; combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Painless Electricity

Science has modified electricity that the weakest may stand its force without fear or pain. Every tissue and fibre is saturated, patient experiencing only a sensation of relief, as if standing in a ray of sunshine. *Violet Ray high frequency* has no comparison with old, crude, electrical batteries and shocking current. Every jar and shock is removed. The effects are marvelously rapid. Relief can be given in one or more treatments. Often cures are accomplished in that time. It is positive and certain in action. If you value your health, and want to keep or restore your good looks and gain vitality, throw away medicine bottles—take this sensible, scientific means. *Violet Rays* work with nature. Every day's delay makes relief more difficult.

Just what you need to know to succeed in ELECTRICITY

EVERY electrician, every engineer, every mechanic should know about these wonderfully helpful instructive books, which give in plain words a complete working knowledge of electrical engineering in all its phases.

You run into some new electrical problem almost every day. The information you need to help you in your every day work is in

HAWKINS ELECTRICAL GUIDES

These books place electricity at your finger ends. They cover every imaginable subject, principle, theory, problem, trouble, and way of doing things electrically. Every subject is indexed so that you can turn right to it. They are a study course and a reference guide in one, written in plain every day language—no wasted words—only what you need to know—chock full of up-to-the-minute electrical knowledge. The guides are a complete course in electrical engineering. They will help you in every detail of the day's electrical work. You can't ask an electrical question that Hawkins Guides can't answer.

What Electrical Men Say

Helped Him Make Good

"It is only right for me to recommend highly the Hawkins Guides, for they have been of the greatest assistance to me in placing me in my present position as Superintendent of Construction Department of one of Ohio's largest Electrical Companies. I would like to see every man have a set of Hawkins Guides."
Geo. Knecht, Columbus, Ohio.

In the Naval Electrical Dept.

"The Hawkins Guides are great help to me in the Naval Electrical Department, which they cover very thoroughly."
C. J. Cornell, U. S. Receiving Ship, Brooklyn, N. Y.

Superintendent

"I am now superintendent of the Dunnville Hydro-Electric Systems, and Hawkins Guides were a great help to me in holding down a responsible position."
W. E. Swartz, Dunnville, Ontario.

Wireless Operators

"I have worked wireless for ten years—but I wish I had these books years ago, as they have saved me a great deal of trouble." H. Marshall, Steamer M & H No. 2, Walkerville, Ont.

Pocket-Size Flexible Covers

The books are small enough to slip into your coat pocket—handsomely bound in flexible black covers.

You can carry each volume with you until you have mastered its contents. 3,500 pages of actual information and 4,700 illustrations. Once you see these books and put them into actual use you will never again want to be without them. Try it at our expense.

SEND NO MONEY

It will cost you nothing to receive these books—to look them over—ask them all the questions you can think of—use them in your work—study them—pick up some information that will increase your earning ability. We will ship you the entire set of 10 volumes entirely FREE.

This is a sign of our confidence in the guides. Pure gold does not object to being tested. Keep them for seven days and if you do not decide that you can't get along without them, return them to us and owe us nothing.

When you decide to keep them you only have to pay $1.00 down and remit the balance of $9.00 on the easy payment of $1.00 a month till paid for.

Use this coupon to get the books. It will pay you many times over.

READ THIS PARTIAL LIST OF CONTENTS

No. 1 Contains 348 pages, 385 illustrations. Electrical signs and symbols—static and current electricity—primary cells—conductors and insulators—resistance and conductivity—magnetism—induction coils—dynamo principles—classes of dynamos—armatures—windings—commutation—brushes, etc.

No. 2 Contains 348 pages, 394 illustrations. Motor principles—armature reaction—motor starting—calculations—brake horsepower—selection and installation of dynamo and motors—galvanometers—standard cells—current measurement—resistance measurement—voltmeters—wattmeters—watt hour meters—operation of dynamos—operation of motors, etc.

No. 3 Contains 300 pages, 423 illustrations. Distribution systems—wires and wire calculations—inside, outside and underground wiring—sign flashers—lightning protection—rectifiers—storage battery systems, etc.

No. 4 Contains 270 pages, 379 illustrations. Alternating current principles—alternating current diagrams—the power factor—alternator principles—alternator construction—windings, etc.

No. 5 Contains 320 pages, 614 illustrations. A.C. Motors—synchronous and induction motor principles—A. C. commutator motors—induction motors, transformers; losses, construction, connections, tests—converters—rectifiers, etc.

No. 6 Contains 298 pages, 472 illustrations. Alternating current systems—switching devices—circuit breakers—relays—lightning protector apparatus—regulating devices—synchronous condensers—indicating devices—meters—power factor indicators—wave form measurement—switch boards, etc.

No. 7 Contains 316 pages, 379 illustrations. Alternating current, wiring power stations—turbines; management, selection, location, erection, testing, running, care and repair—telephones, etc.

No. 8 Contains 332 pages, 436 illustrations. Telegraph—simultaneous telegraphy and telephony—wireless—electric bells—electric lighting—photometry, etc.

No. 9 Contains 322 pages, 627 illustrations. Electric railways—electric locomotives—car lighting—trolley car operation—miscellaneous applications—motion pictures—gas engine ignition—automobile self-starters and lighting systems, electric vehicles, etc.

No. 10 Contains 513 pages, 599 illustrations. Elevators—cranes—pumps—air compressors—electric heating—electric welding—soldering and brazing—industrial electrolysis—electro plating—electro-therapeutic—X-rays, etc.

Also a complete 126-page ready reference index of the complete library. This index has been planned to render easily accessible all the vast information contained in the 10 electrical guides. There are over 13,500 cross references. You find what you want to know instantly.

THEO. AUDEL & CO.
72 Fifth Ave.
New York, N. Y.

Please submit me for examination Hawkins Electrical Guides (price $1 each). Ship at once, prepaid, the 10 numbers. If satisfactory I agree to send you $1 within seven days and to further mail you $1 each month until paid.

The Rise of A Man Who *Wouldn't* Stay Down

Now Chief Engineer

HE was putting in long hours at monotonous unskilled work. His small pay scarcely lasted from one week to the next. Pleasures were few and far between and he couldn't save a cent.

He was down—but he *wouldn't stay there!* He saw other men promoted, and he made up his mind that what they could do *he* could do. Then he found the *reason* they were promoted was because they had special training—an expert knowledge of some one line. So he made up his mind that *he* would get that kind of training.

He marked and mailed to Scranton a coupon like the one below. That was his first step upward. It brought him just the information he was looking for. He found he could get the training he needed right at home in the hours after supper. From that time on he spent part of his spare time studying.

The first reward was not long in coming—an increase in salary. Then came another. Then he was made Foreman. Now he is Chief Engineer with an income that means independence and all the comforts and pleasures that make life worth living.

It just shows what a man with ambition can do. And this man is only one out of hundreds of thousands who have climbed the same steps to success with the help of the International Correspondence Schools.

Are you satisfied merely to hang on where you are or would you, too, like to have a real job and real money? It's entirely up to you. You don't *have* to stay down. You *can* climb to the position you want in the work you like best. Yes, you can! The I. C. S. is ready and anxious to come to you, wherever you are, with the very help you need.

Surely when you have an opportunity that means so much, you can't afford to let another priceless hour pass without at least finding out about it. And the way to do that is easy—without cost, without obligating yourself in any way, mark and mail this coupon.

Bigger Pay for YOU

LIBRARY JUL 26 '19 U.S. PATENT OFFICE

You Can Now Know ELECTRICITY As Experts Know It

"See them first--pay afterwards"

Small Monthly Payments if you're satisfied

8 Vols.

Flexible binding

Pocket size

3000 pages

2100 illustrations

When we observe the ever-increasing applications and usages of electricity, we wonder if all the present openings and the newly created positions in the electrical world can ever be filled.

The ending of the war lends a new and mighty impetus to the electrical end of American industries. Salaries are soaring. There is practically no limit to the earning power of the man who educates himself in the finer points of electrical work.

Actual working facts

With the advent of the new Library of Practical Electricity, by Terrell Croft, a new era is marked in the production of self educational electrical literature. This library satisfies a demand never heretofore met—the demand for a home study course which would bring out in detail the actual working facts. This great undertaking has been accomplished. It is a seven-year task completed.

No previous electrical training necessary

Three thousand pages, with twenty-one hundred of the clearest illustrations ever put into book form. Each of the eight volumes is indexed so that everything you want to know about electricity is at the finger's end. And when you find what you want, there is not merely a short question and a short answer. You are told everything you want to know. The explanation is clear to you, regardless of whether you have had a previous knowledge of electricity or not.

Know electricity as the highest paid engineers know it

When you are studying the Croft Library of Practical Electricity, you are studying electricity as experts know it. You are acquainting yourself with the methods employed by the highest paid electrical workers and engineers in America.

This Library of eight volumes sent to you FREE for 10 days' trial

So positive are we that you will be pleased with the Croft Library of Practical Electricity that we offer to send the entire ten volumes for ten days' free use. All you need do in order to have the books sent, charges prepaid, is to fill out the attached coupon and return to us. Keep the books ten full days. Then if you are not satisfied, return them at our expense. On the other hand, if you find that they will help you, as they are helping thousands of others, send us the small sum of $2 per month for eight months.

A letter that means something to every man in America who is interested in electricity

McGraw-Hill Book Company, Inc.
239 West 39th Street, New York, N. Y.

Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.

Respectfully,
GUY H. PEIFER,
Chief, Doplan Silk Corporation, Hazleton, Pa.

EDITORIAL

Speeds

IF you had read twenty years ago that it was considered probable and very possible that in 1919 some one would fly across the Atlantic Ocean on canvas wings, propelled by a gas engine, at a speed of 100 miles an hour, you naturally would have turned away impatiently at such childish nonsense. Moreover, you probably would have doubted the sanity of the writer; but even Jules Verne with his most prolific and prophetic mind never prophesied the 1919 trans-Atlantic flight in a heavier-than-air machine.

This naturally brings us face to face with the future. Tho prophesying, as a rule, is bad business, there are certain scientific subjects that can be predicted safely, basing the prediction on mathematical as well as purely scientific grounds.

The question before us is: How fast is it possible for man to travel thru the air? Theoretically at least, there is no limit to the speed at which a human being can travel.

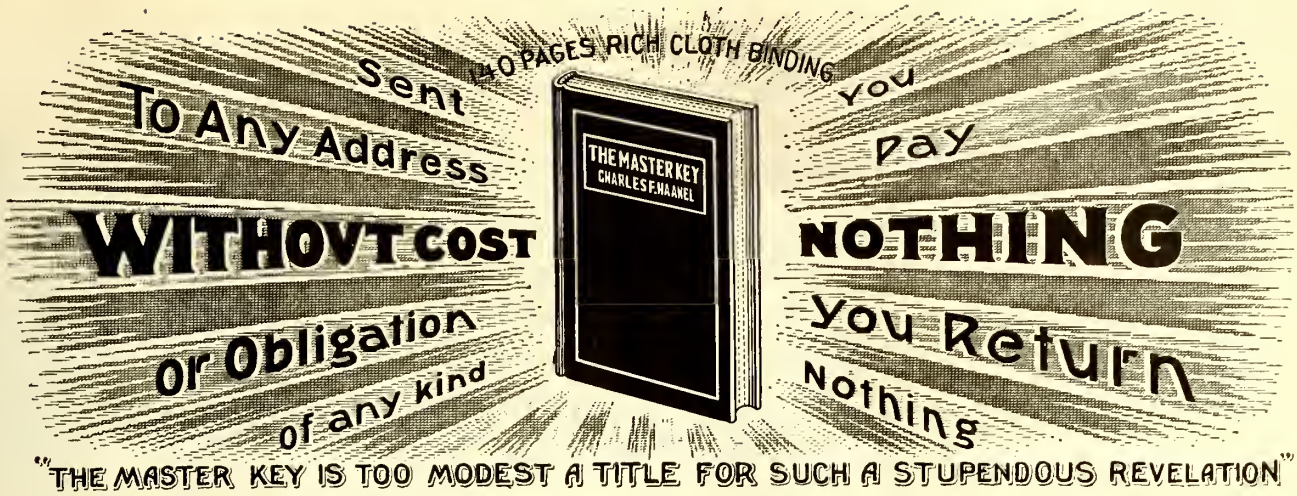
Airplanes already have covered over 200 miles an hour without discomfort to the aviator. At this point we venture to say that should the speed be increased over 300 miles per hour, the aviator will probably be very uncomfortable, due to the terrific rush of air. Even at 100 miles per hour the air lashes the face of an aviator badly. Therefore, flying above 300 miles per hour, he will have to sit in a cabin surrounded by glass, where the rush of the air cannot be felt. Suppose we increase the speed to 500 miles. What happens? Nothing. This speed is so probable that it will no doubt be reached before 1925; possibly much sooner. But we think such speeds will not be reached near the surface of the earth where the density of the air, and consequently the greater resistance to an airplane, is too high. In order to travel at 500 miles per hour, the future airplane must offer as little surface to the air as possible. It should have no struts, wires, or stays. It probably will fly at a height of 5,000 feet or more, decreasing its speed as it approaches the earth. 1,000 miles an hour? Yes, man will do it. It is not only possible, but very probable. It will be accomplished in a machine which bears but little resemblance to our present-day airplane. Moreover, it will be absolutely necessary to rise at least to 25,000 feet above the earth, as otherwise the dense air will tear the machine apart, unless it were constructed entirely of metal. But because very much less power is required at the level of 25,000 feet, future express airplanes will prefer the high altitudes.

We might mention, *en passant,* that if you were in a machine flying at a steady speed of 1,039 miles per hour, also supposing you had enough fuel to stay up 24 hours, the following historical event would take place. Starting at noon and flying due West along the equator, with the sun above your head, the sun will not set for you on that memorable day. It will be directly overhead, as long as you keep on going, *for you will now be flying at the rotational speed of the earth,* which is 1,039 miles an hour. Looking down you will see the earth make one complete revolution; you will have seen every point and every continent along the equator. But 1,000 miles per hour is very tame. The earth in its orbital motion around the sun rushes thru space at the terrific rate of 65,533 miles an hour; Venus at 77,054 and Mercury at 105,325 miles per hour. So let us be hopeful!

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. **A green wrapper indicates expiration. No copies sent after expiration.**

All communications and contributions to this journal should be addrest to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.



ELECTRICAL EXPERIMENTER. Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office.

VIOLET-RAYS

The Magic-like Reliever of Pain. The Marvel of the Age for Rheumatism, Neuralgia, Neuritis, Arteriosclerosis, Hemorrhoids, and Practically Every Other Ailment to Which Flesh is Heir. A Wonderful Beautifier Too! Amazing in the Treatment of Eczema, Blackheads, Wrinkles, Falling Hair, Dandruff, and Every Other Faulty Condition of the Skin and Scalp!

10 DAYS FREE IN YOUR OWN HOME

See for yourself the miraculous results of Violet-Rays. Get the wonderful Violetta Violet-Ray Machine for 10 days' free use in your own home. Give yourself exactly the same Violet-Ray treatments for which eminent physicians and beauty specialists charge big fees. Note the marvelous relief that comes even with the first treatment. See how you can virtually feel the Violet-Rays reaching to the very root and cause of any ailment with the great curative forces of Heat, Light, Electric Energy, and Ozone. See too how Violet-Rays youthifies the skin, purifies the scalp and stimulates hair-growth. Note above all how refreshing the effect of Violet-Rays to mind and body—how invigorating and vitalizing—how much better you work, eat and sleep. Prove all these benefits to yourself without obligation. Try the Violetta for 10 days free, and if you are not more than amazed and delighted, simply send it back.

BLEADON-DUN CO., Dept. 2G,
326 W. Madison St., Chicago, Ill.

Please send me your free book and 10 days' free trial offer on the Violet-Ray Machine. Also full information as to treatment for ailments marked below.

Asthma	Earache	Piles
Barbers' Itch	Eczema	Paralysis
Boils	Eye Diseases	Pimples
Blackheads	Headache	Pyorrhea
Bunions	Hay Fever	Rheumatism

Calcium Chloride ($CaCl_2$)
Calcium Oxide (CaO)
Calcium Sulphate ($CaSO_4 2H_2O$)
Charcoal (Carbon) (C)
Chloride of Zinc ($ZnCl_2$)
Copper Sulphate ($CuSO_4$)
Ferrous Sulphate ($FeSO_4$)
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride ($FeCl_2$)
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate ($MgCO_3$)
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride ($NiCl_2$)
Oxalic Acid ($H_2C_2O_4$)
Sodium Bicarbonate ($NaHCO_3$)
Sodium Borate ($NaBO_2$)
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate ($NaNO_3$)
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride ($SnCl_2$)
Sulphate of Nickel ($NiSO_4$)
Sulphate of Zinc ($ZnSO_4$)
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate ($ZnCO_3$)

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

"ELECTRO"

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains **real** chemicals and apparata to perform **real** chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real **Chemistry Course for the Beginner.** Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature.** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

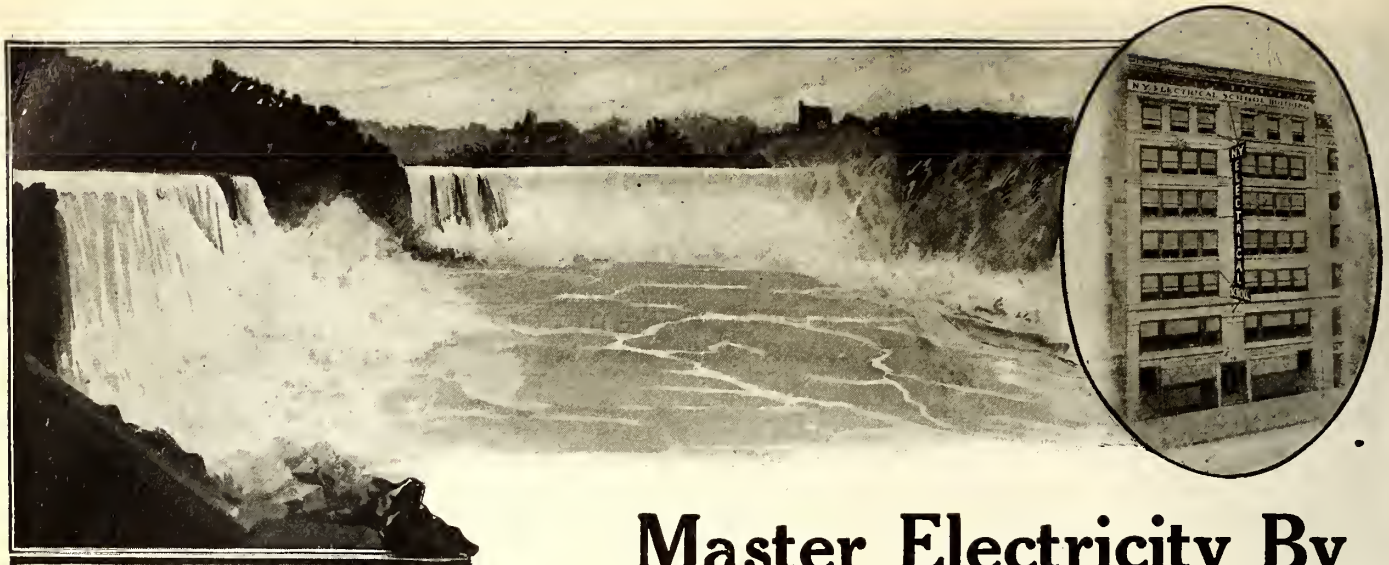
A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights, Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

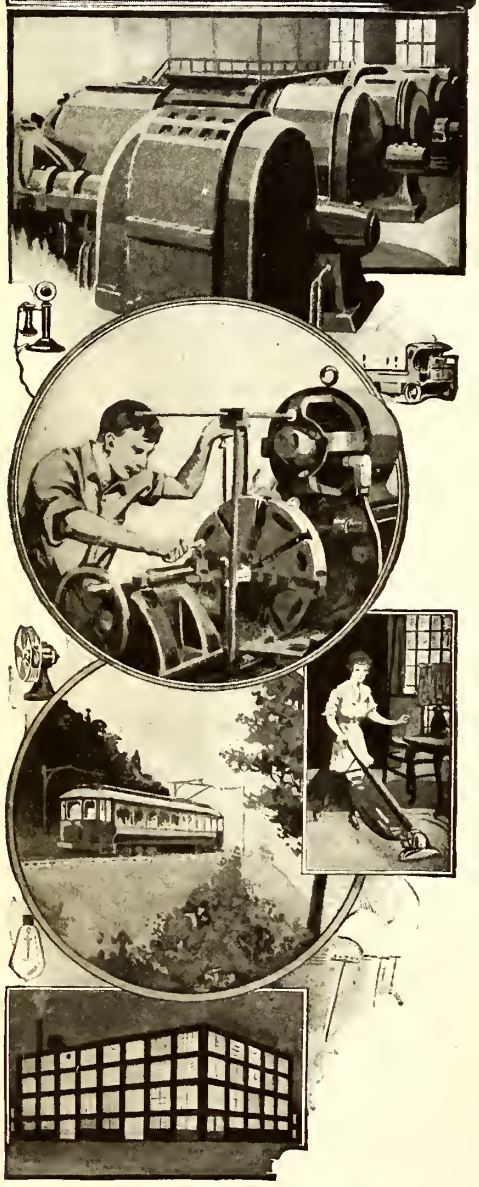
Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00



Shipping Weight 10 lbs.



(Can be shipped by Express only.) Send your order today to:

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School
29 W. 17th St., New York, N. Y.

Please send FREE and without obligation to me your 64-page book.

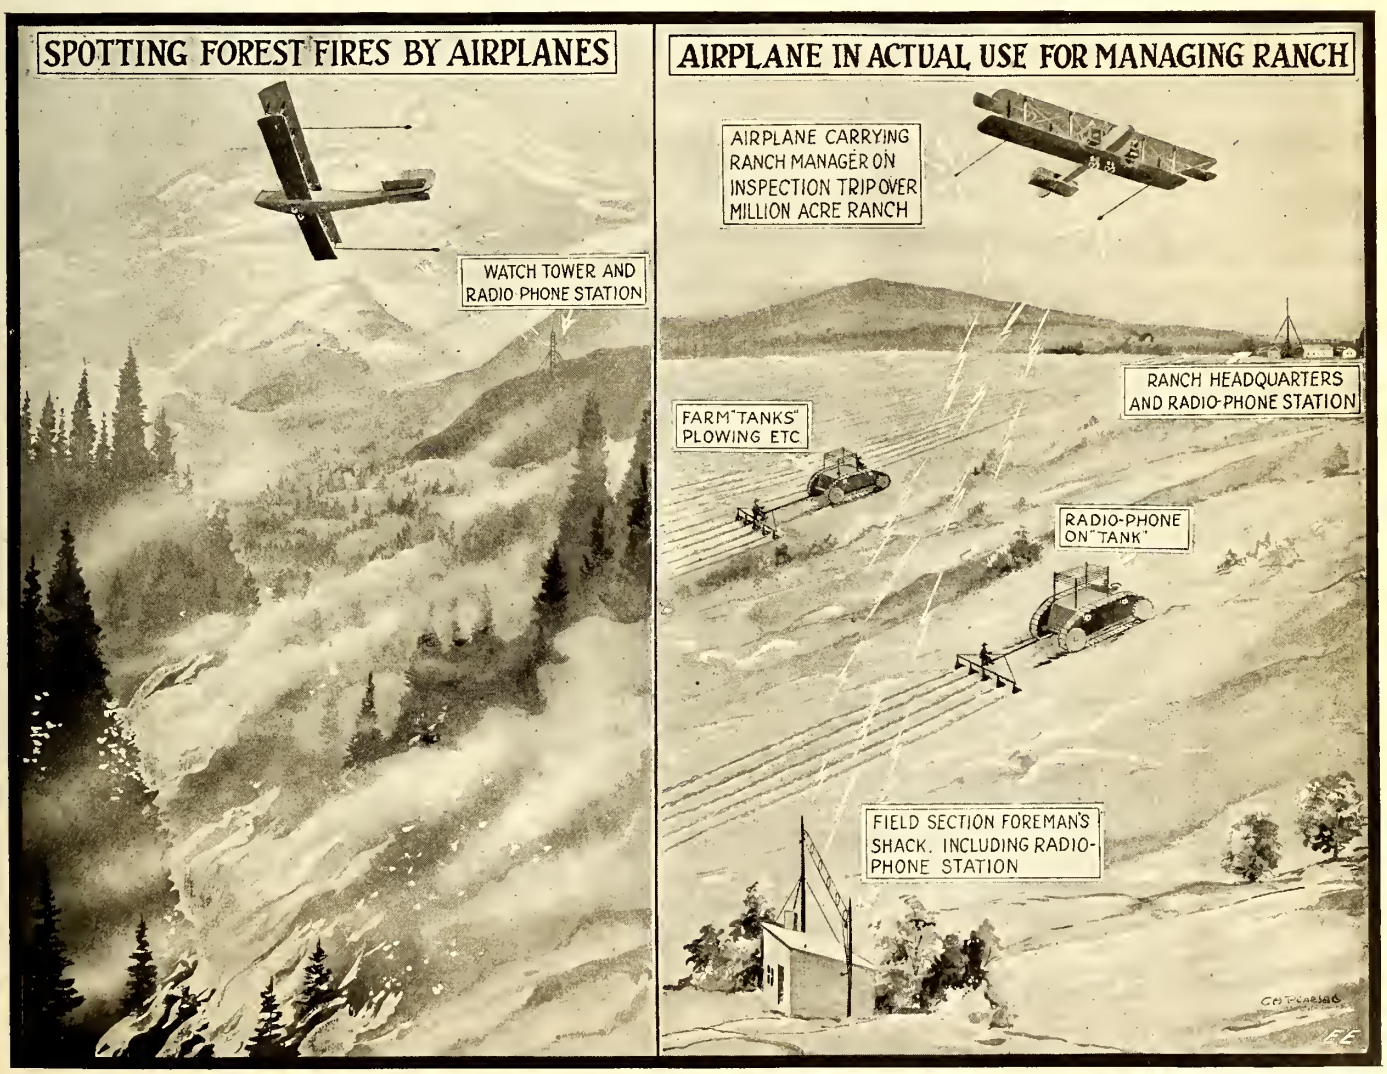
Vol. VII. Whole No. 76 AUGUST, 1919 No. 4

Radio-Planes Watch Forests and Ranches



AIRPLANES, plus radio-telephone equipment, have found a brand-new peace-time utility—watching for forest fires in the vast government timber preserves, and also for supervising the operation of large ranches, such as those embracing thousands of acres and found frequently in the great Western farming regions. Some of these farms and ranches are so large that it takes a superintendent all day to make an inspection trip across the ranch, even with a high-powered automobile.

How the Airplane Plus Radio Is Used to Watch Great Forests and Ranches

The airplane as part of a farm equipment is now a reality. It makes its appearance at Hardin, Mont., on the wheat ranch owned and controlled by John Pierpont Morgan and other New York capitalists. Erhardt Schmitt, former American army aviator, has been employed to operate the machine. His duties are to carry the ranch manager from one part of the 250-mile, 100,000-acre wheat ranch to other fields. A wireless telephone in the airplane enables the manager to keep in constant communication with the ranch headquarters.

Not only can the manager or superintendent immediately report back to the ranch headquarters, by radio-telephone, but he can give local orders to gang or section foremen by means of small radio receiving

Bomb Expert Eagan

SPECIAL INTERVIEW TO THE ELECTRICAL EXPERIMENTER

Types of Bombs and How to Handle Them

Section of a Film Story of Mr. Owen Eagan's Exploits in "Bombland." For Years Inspector Eagan Has Inspected Infernal Machines by the Hundred and Still Lives to Tell the Tale.

"OWEN EAGAN"! At the mention of his name, the thought of bombs, anarchistic plots and explosives flood the mind. Seated at his desk, I found a man of sixty years, of medium height and massive proportions; head covered with curly gray locks. His eyes are of piercing steel gray and he has an ever-ready smiling countenance. A firm hand clasp told of a man of power, youthful in spirit, a believer in the great out-doors, a staunch American who cherishes a long and lasting friendship with that Great American, Theodore Roosevelt.

Mr. Eagan Classifies the Bombs.

We will now let Mr. Eagan tell of his bombs. Among other things. Mr. Eagan said:—

Bombs may be classified into four types, according to the explosives used: Nitro-cellulose, Nitro-glycerin, Nitro-benzol, Alkalin metallic nitrat mixtures.

These explosives permit of many combinations and varied means of igniting them. Bombs may be further classified according to the method of ignition used: Manual, Mechanical Electrical, Chemical.

The container or envelope of a bomb may be anything from a newspaper wrapt around the explosives to iron pipes, ice cream freezers, violin cases, cigar boxes, bottles filled with concrete and all imaginable kinds of wrappers.

RULES FOR HANDLING BOMBS

By INSPECTOR OWEN EAGAN,
Bureau of Combustibles,
NEW YORK FIRE DEPARTMENT.

If you should receive what you believe to be a bomb or infernal machine thru the mails or by messenger

1. **LEAVE IT ALONE,**
2. **DO NOT PLACE IT IN WATER,**
3. **CALL THE FIRE DEPARTMENT, OR IF IT IS NOT CONVENIENT, CALL THE NEAREST POLICE OFFICER, WHO WILL AT ONCE NOTIFY THE FIRE DEPARTMENT, AND HAVE THE EXPERT COME TO INSPECT THE SUSPICIOUS PACKAGE IMMEDIATELY.**

It is a common but fallacious rule among the general public, that in order to be safe with a bomb or infernal machine, it should at once be placed in a pail of water. If the bomb or infernal machine has a fuse attached to it, and the fuse may be seen burning or sputtering, then drop the bomb in water, which method usually is efficacious in making it harmless, as the lighted fuse is at once extinguished, but the best advice is to leave the house.

However, when this lighted fuse is NOT PLAINLY EVIDENT on the bomb or infernal machine, IT SHOULD NOT BE PLACED IN WATER, as many of these hellish devices are chemically or electrically operated. Another possibility likely to occur, if the suspected bomb or package is placed in water, is that some of them are made up in part of certain chemicals which will explode as soon as the water reaches them. There is an added probability that if the package or bomb is immersed in water, the reaction between the water and the chemical may give rise to a violent and persistent combustion, the flames of which will set fire to the house. In some of these contrivances there is a second compartment containing a high explosive, which can be ignited by heat, and where such a condition as outlined may occur, it is at once apparent that the heat due to the combustion of the initial chemical may generate sufficient heat to detonate the explosive, with possibly fatal results.

Every bomb presents a new problem as regards its envelope, contents and construction, and the best means of opening it without causing it to explode and send me "West." Everything is filled with uncertainty at this stage. The task requires ingenuity, nerve, precision and firmness of hand, which is essential to a surgeon in performing a very delicate operation. In both cases, a life is in the balance. These qualities cannot be gained by study, but must be secured by experience covering many years.

We now enter the second phase of the work. It is now necessary for me to classify and analyze the layout, materials, methods and plan of the bomb maker. What's in the vial? Why the wire? Where is it attached? What's this powder? Is it a mixture of several chemical substances? Why this and why that? Two, four, seven compartments, everything interlocking! Can't see the battery, detonating cap! Can't pull its "teeth"!

The scene is set in someone's home or office, sometimes it is my laboratory; every one has gone; the windows have been raised, doors opened to relieve the compression in the event of an explosion. There are two opponents, a bomb and Eagan, but Dame Experience is always with me.

The hellish combination has been broken down and then the "guests" are called and there on the table before them in various groups are explosives, timing devices, detonators, ignition mixtures, acids, vials, batteries, wires, fuses and the "bomb-maker's camouflage". Now the wheels of Justice are set in motion and the search for the bomb-maker begins.

Since the discovery and use of gunpowder, bombs of various types have been used.

The First New York Bomb Outrages.

The first series of bomb outrages in New York, from 1902 to 1910, known as the "Blackhand Bombs," occurred in the Italian section, and these were chiefly of the nitro-glycerin group, manually ignited. Dynamite was placed in olive oil cans and ignited by a time fuse which the "dynamiter" lighted and walked away to await developments.

A large number of bombs of the alkalin metallic nitrat group were made during this period. These consisted of various nitrats and chlorats and were exploded by time fuses manually ignited. Some were of the grenade type and were hurled at the victims.

Most of the bombs of this period were of a crude design and were made from articles of every day

Peacetime Uses for War Inventions

By H. Winfield Secor

"SCIENCE moves in mysterious ways, her wonders to perform"—to paraphrase the well-known biblical passage, and never was this demonstrated more pertinently than at the present time, when we find many of the great World War's deadly inventions being converted to peacetime uses. Everybody is being benefited by the industrial application of some of the greatest inventions yet perfected by man, and many thousands more will live to reap the benefits accruing from the as yet undreamt-of applications for both business and pleasure, of airplanes, tanks, wireless devices, submarines, and a thousand and one other attainments of the world's master scientific minds.

A semi-humorous application of the Meissner *airfone*, described elsewhere in this number, is shown in Fig. 1. This device, which is very simple in construction, resembles a speaking tube in form, but incorporates several novel and distinct improvements, among others, an acoustic amplifier, making the device very efficacious for carrying on conversation between the pilot and observer in an airplane, where it is extremely difficult to hear under ordinary conditions, due to the great noise of the engine. A new application of this device is here suggested, namely, to muffle the ever-present and detestable "movie pest." Not only do we find these miserable atoms of humanity in the dark quiet of the movie theater, but also in all of the regular theaters. These brilliant insects must have seen some of the shows which we happened to frequent, about 999 times,—so replete is their knowledge of the "star" and "staress" and all the lesser satellites appearing in the play. They will tell you loudly the climax half an hour before it comes off and so on. So, thanks to the Meissner *airfone*, it should not be so very long before "us ordinary mortals" shall be able to go to the theater and enjoy a performance without having one of these human dramatic compendiums racing along two knots ahead of us, all the way thru the play and telling his sweetheart every move just before it happens. Some of you may like your entertainments served up that way—as for us, we object!

A very good use for the Boche's far-famed *Poison Gas* is shown in Fig. 2. What better application than to annihilate the rats by asphyxiation—"sauce for the goose is sauce for the gander." The Germans thought they had something brand new in strictly war inventions when they tried poison gas on the Allies, but among other recent applications of this invention to peacetime utilities and requirements was that of killing rats. Of course it goes without saying that before injecting a few dozen cubic feet of mustard or chlorin gas into a rat hole, that you had best provide yourself with a guaranteed gas mask and also buy a few dozen corks with which to plug up the other openings in the walls or floor boards. Give it a trial, ladies and gents—it's the "kaiser" of all rat killers.

Embryonic *Tanks* were already in use for agricultural and other purposes long before the World War, and in fact the first tanks used by the British Army on the battlefields of France were reconstructed agricultural tractors, built in the United States. These tractors were armed with steel plates and fitted with rapid-firing guns. The illustration, Fig. 3, shows another application besides that of the usual plowing and cultivating operations—that of hauling large logs in the lumbering districts of the great West. In these localities it is difficult to build even small railroads, and it doesn't pay to build any extensive trackage for such log railroads, as they are not apt to be used for any great length of time. Therefore, the tank tractors should prove very useful, as they can travel over practically any kind of ground, including ditches and even over logs. It will be remembered that during operations in the World War the tanks could crawl over great shell holes, trenches and brooks. This application should provide some fine chances for those of our Tanks Corps soldiers who are aching for army life and the ups and downs met with in the everyday career of a "tank rider." These tanks can haul tremendously heavy loads and resemble in their operating characteristics the work of the famous elephants of India, who pick up with their trunks giant timbers 30 to 40 feet long and measuring 8 to 10 inches square.

Airplanes—oodles of them—will soon be flying over our heads every day all over America. Many people have an idea that the airplane is a peacetime luxury, not to mention a wartime necessity. But such is not the case. If for no other reason the airplane has come to stay in its everyday application to the transportation of mail and the lighter classes of merchandise as by multiplying its everyday utilities, the practical development of aircraft is bound to result. This country, as well as every other power, is keen, of course, to develop aircraft to the highest pinnacle of practicability. The U. S. Army, as well as the Navy Department, has only recently put up a stiff fight for many millions of dollars with which to carry on much-needed airplane developments. One of the best ways to train fliers, especially in this country, where a large standing army or navy personnel is never maintained, will be without a doubt to encourage in every way possible the commercial application of flying machines of all types. Already in England a piano has been transported across the English Channel by airplane, and airplanes are at present available which can lift very heavy loads, and, morever, they are daily becoming more reliable and less liable to accident, should any part of the machinery fail while in the air. Hundreds of people of course take one look at an airplane, especially when it is ascending or descending in flight, and are satisfied to keep both feet on old *terra firma*. However, some of the latest types of airplanes are guaranteed to right themselves and land safely, even if the engine stops in mid air and the control cables become tied or ruptured. See Fig. 4.

Liquid Fire, as shown in Fig. 5, should prove efficacious for several industrial uses, such as burning off paint from iron and steel structures, vessels, etc., and, according to H. Gernsback, also for blazing a path or hole thru ice jams, which frequently prove extremely dangerous during the American winters, when they clog rivers and streams, as well as dams. Under certain conditions it might also be used to blaze paths thru jungle brush.

The *Geophone* is a remarkable physical instrument greatly improved and perfected during the war by the engineers connected with the Allied technical staffs, and used with great success for the purpose of locating enemy artillery and other military operations. Now it has found a distinct peacetime use. See Fig. 6. The saving of many miners' lives has been made possible, thanks to the Geophone, which can detect sound vibrations thru the earth at surprisingly long distances. It has been used successfully in some Government mine tests to pick up the sound of a pick-axe at a distance of about one-quarter mile. There is nothing electrical about the Geophone. It is purely mechanical and acoustic in its function. It operates on the principle that the inertia of a small lead weight within the instrument, and which is secured to a set of diaframs, will tend to hold its initial position whenever an earth-borne sound vibration, for instance, happens to affect it. The other part of the instrument moves and the lead weight tends to remain stationary in the same manner as your body sways forward due to its inertia when a car suddenly stops. The relative movement of the diafram to which the weight is attached with respect to the movement of the casing sets up an air wave, and this is transmitted to the ears thru a rubber tube, in the same way as a physician's stethoscope works. By means of this wonderful instrument, therefore, it is now possible to actually locate entombed miners at considerable distances. Communication with them is also possible by this means. Knowing the location of the entrapt men, it becomes much more expeditious to carry on rescuing and excavating operations in order to save them.

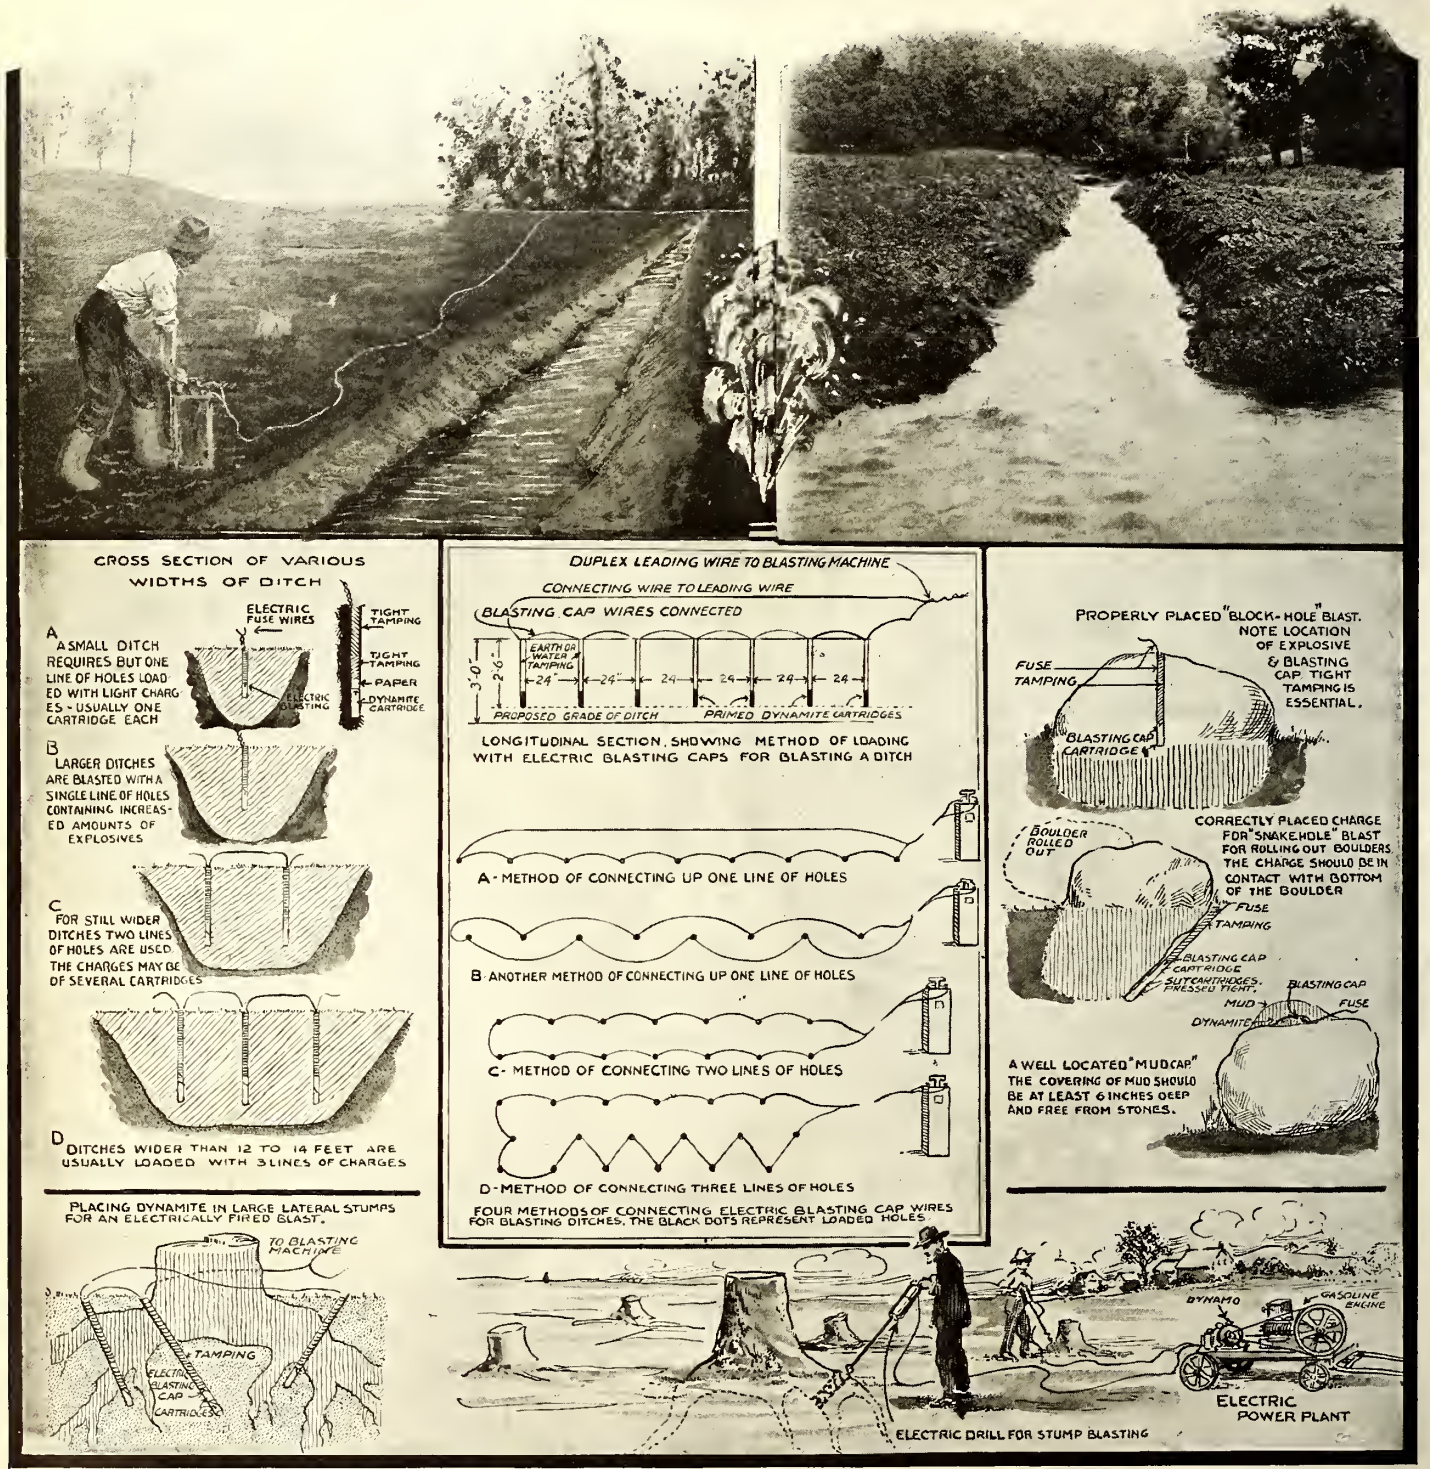
Changing Nature's Face

How Electricity Plus Dynamite Makes Brooks, Removes Stumps and Breaks Up Rock

THE World War has, if nothing else, brought to light the great flexibility and usefulness of explosives such as *dynamite,* not for the purpose of annihilating men and cities, but for the more human, utilitarian purpose of leveling uneven and rocky ground, blasting out stumps from previously wooded ground, and breaking up rock. Again, brooks and irrigating streams are rapidly "dug" in a single day by the use of *dynamite plus electricity,* under the highly developed methods now available for applying explosives, and even the course of a river has been changed in the twinkling of an eye.



What we are interested in, in the present discussion, is the practical application of explosives to the everyday requirements of the tiller of the soil and those who are interested in improving wooded or rock strewn property.

The Electrical Detonator.

In "blasting by electricity," use is made of a slight electric current usually generated by a hand-operated dynamo of the magneto type. The dynamo is placed in a substantial cabinet to stand hard usage such as is encountered in blasting work, with a handle protruding from the top of the box containing it. This handle is attached to a gear rack and pinion, the pinion being secured to the shaft of the dynamo, so that when the handle is drawn up and then quickly deprest, the armature of the dynamo will be spun rapidly, thus generating a current of fairly high potential.

The *electric detonator* used in blasting, comprises a small copper shell, in which an explosive charge is placed. Two insulated

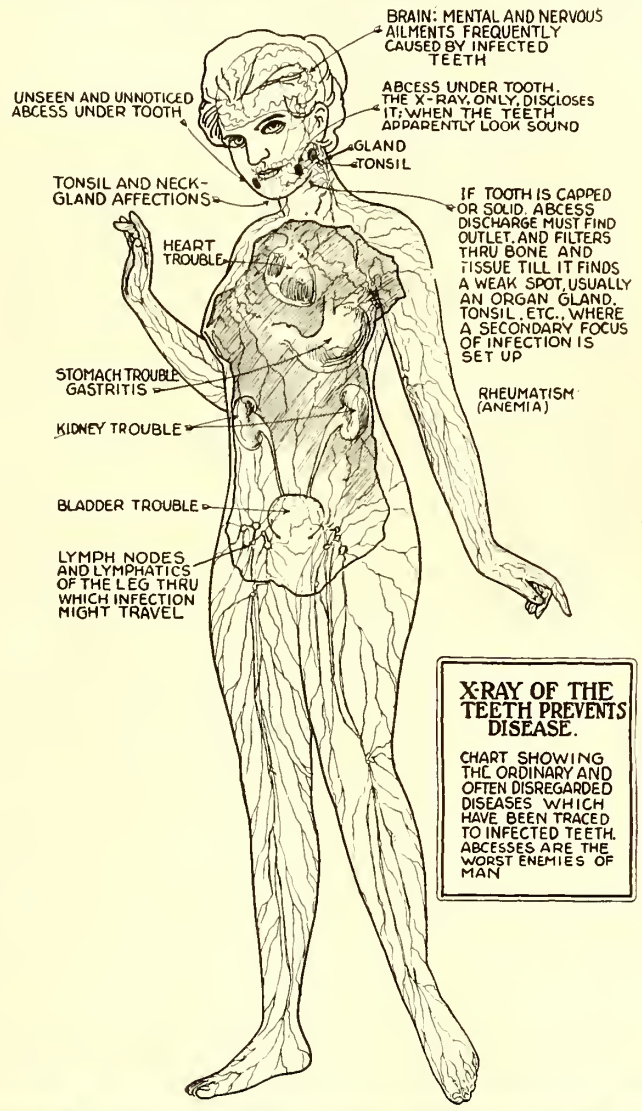
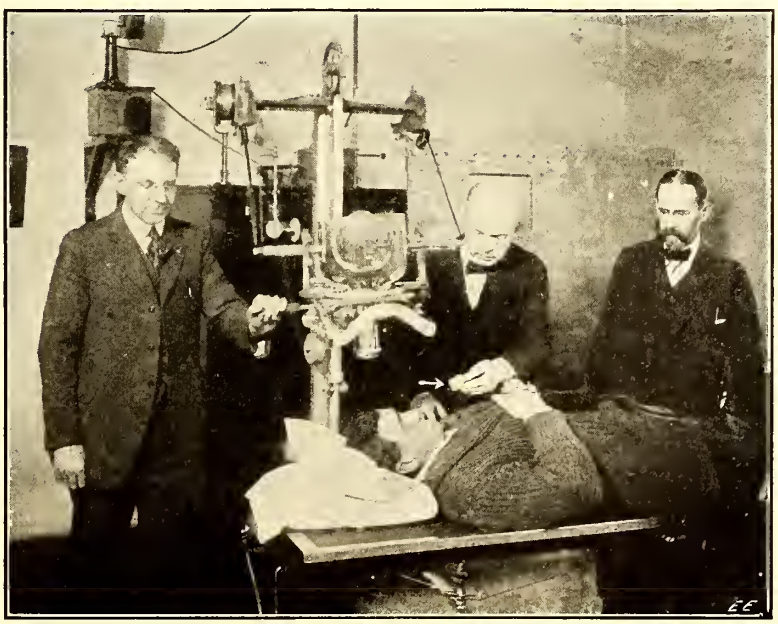
Man's Greatest Curse--Infected Teeth

The Work of HENRY A. COTTON, M. D.

MEDICAL DIRECTOR NEW JERSEY STATE HOSPITAL, TRENTON, N. J.



How X-Rays of Teeth May Prevent Disease and Insanity



INVESTIGATIONS in the last few years, by both dentists and physicians, have shown conclusively that the greatest menace to the health of the human race today is to be found in the bad condition of the teeth of a large majority of the populace. The instinct of the individual is directed toward saving the teeth, and, unfortunately, a large proportion of the dentists foster this instinct, and in consequence, teeth are capt and otherwise repaired by expensive *bridgework* in order to save the teeth, when from the standpoint of the patient's subsequent ill-health, these teeth should be extracted. Happily,

MAN'S greatest danger, the biggest curse of humanity today, are infected teeth. Millions of people are dying of all sorts of diseases, caused directly by infected teeth. Inflammatory rheumatism, insanity, chronic stomach diseases, Bright's disease, nervous diseases, all these are now attributed to infected teeth. The work of Henry A. Cotton, Medical Director of the State Hospital of Trenton, N. J., is of such epoch-making and tremendous importance that every human being ought to know of it.

the best dentists have realized for some years that serious results frequently follow such procedures and have warned the profession against this danger. This subject has received special attention by Dr. Henry A. Cotton, Medical Director New Jersey State Hospital, Trenton, N. J., who in a recent statement on the importance of X-raying the teeth, has the following to say:

"Unfortunately for the patient, infected teeth may not and often do not cause any symptoms which would lead one to believe that anything is wrong with his teeth. This type of infection is what is known as *chronic* in contradistinction to an *acute* infection, and does not cause pain, pus or swelling, and frequently no rise in temperature. Hence, there are no symptoms which direct the patient's attention to this condition, and often they are amazed when they are told that they have infected teeth and that they must have a certain number extracted if they wish to recover from their particular illness. The question is often asked, 'How are we to know that teeth which give no evidence to the patient of serious and often dangerous infection, and externally give no evidence to the dentist of such condition, are infected'? The answer to this is the *X-ray*, and a more general use of this very simple and harmless procedure will reveal to the dentist as well as to the patient the existence of infected roots, *when to casual inspection the teeth may seem to be healthy and worthy of saving!* Naturally, these should immediately be extracted.

Taking X-Ray Photos of the Teeth at New Jersey State Hospital Laboratory. Arrow Indicates the Small Plate Holder About to Be Placed in the Mouth.

"Each individual should know whether or not he is harboring dangerous infection, which may not only undermine his general health but may endanger his life if it be not eradicated. With this knowledge of the danger of infected teeth, all persons should insist upon a thoro examination of their teeth by means of the X-ray and not take the word of a dentist who merely inspects the teeth and pronounces them all right. The failure of the dentist to recognize the existence of root infection and the practise of putting in pivots, gold crowns and bridge work, without first taking *radiographs* of these teeth to be sure that there are no infected roots, has sounded the death knell of many people, for when the infection has invaded other organs it is often too late for extraction of the teeth to be of any benefit. No matter if the teeth give no trouble or if one feels perfectly healthy at the present time, if he has had any dental work done at any time, *he should insist upon his dentist radiographing his teeth* so that he will not be the victim of a false security and finally succumb to a fatal disease, which might have been prevented if he had taken the precaution mentioned.

Dr. Cotton proves to us that it is wrong to cap or crown devitalized teeth as they will positively make serious trouble sooner or later. Such teeth should all be extracted immediately; they are the seat of nine-tenths of all our modern diseases.

This article is one of the most important we have publisht for a very long time, and we urge every reader not only to carefully read it, but to spread its gospel among friends. It will save thousands upon thousands of lives.

—EDITOR.

The Cause of Infected Teeth

"The public naturally inquires: 'Why do we have such bad teeth today when our parents and grandparents did not have these conditions, or, at least, did not have these fatal diseases?' There are several reasons for this. In the first place, our forefathers did not bother with dentists except to have an offending tooth extracted. In the second place, modern dentistry had not developed to the point of expensive repair and preservation of the teeth as we know it today. It has been estimated that 80 per cent. of the people who have had repair work done, even in the most expensive and latest manner, *have infected teeth which may become a menace to their health at any time.*

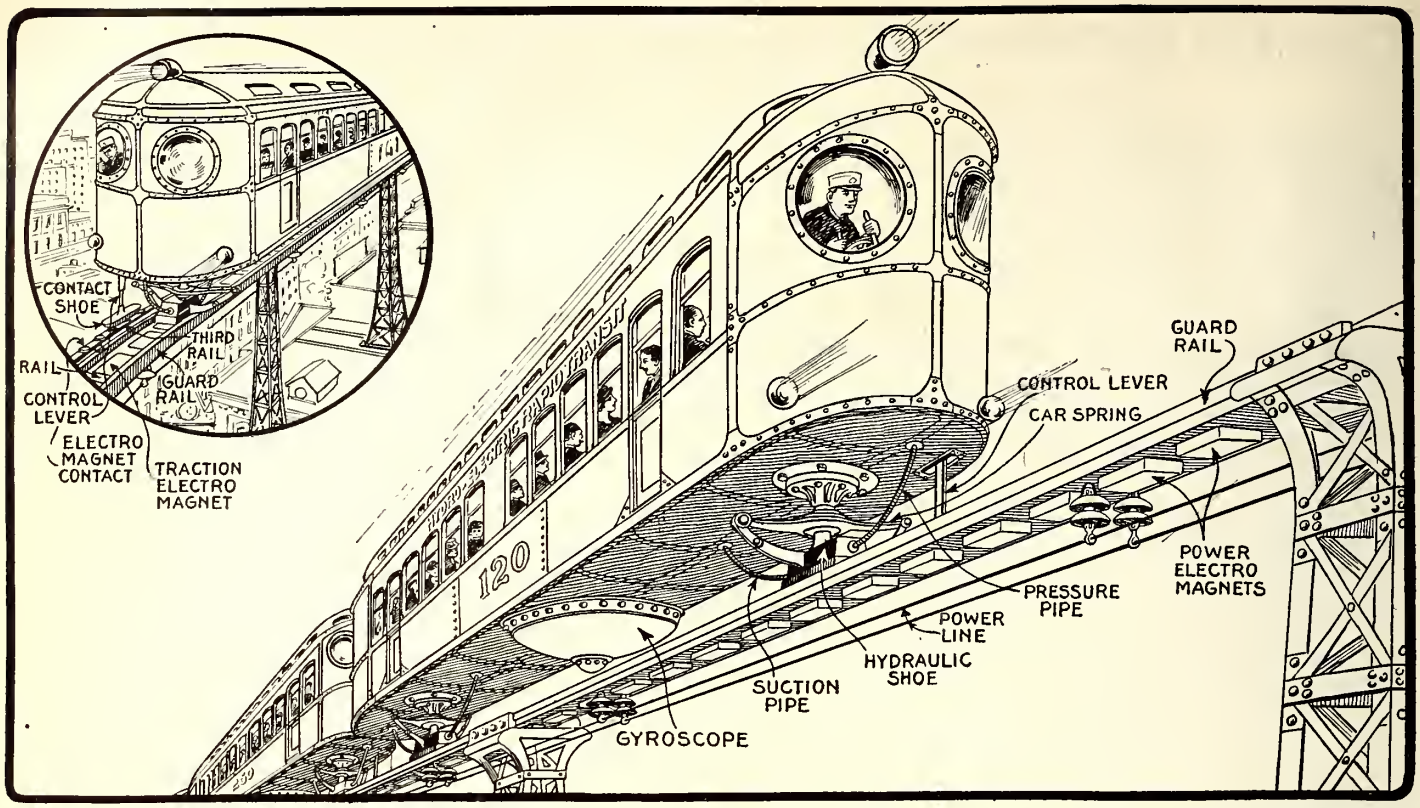

Fig. 5. This Illustrates the Propulsion of the Wheelless Gliding Train. The Two Hydraulic Shoes Glide On a Film of Comprest Water Squirting from Underneath the Shoes. The water Is Recovered by Suction from the Same Shoe So None is Lost. (See Fig. 3.) The Train Itself is Kept Upright On a Single Track by Means of a Gyroscope, While the Cars Are Propelled by Powerful Electro-magnets, the Contacts of Which Are Closed Automatically by the Train as It Moves Along. These Gliding Railroads, Having No Friction, Work So Easily that a Child Can Push Along a Car With Its Passengers.

Solving the Transportation Problem

By H. GERNSBACK

A Railway Which Actually Existed In France

THIS is the story of a most extraordinary railway which at one time existed in France. Its inventor was killed by the invading Germans in 1870. A railroad that is practical and which has demonstrated its successful operation. It is practically frictionless and can move SAFELY with a speed of one hundred miles an hour. It will be in use thruout the world.

SINCE the advent of the steam locomotive in the early 50's of the last Century, no progress whatsoever has been made as far as speed of our railways is concerned. We are today not riding faster either in our electric or steam railways than our grandfathers did 60 years ago. It is true that we have greatly improved everything else as far as comfort, safety, etc. is concerned, but the speed has not been increased whatsoever. Sixty miles an hour was an everyday occurrence sixty years ago, and was attained by many trains. Today, the average speed of the steam or electrical railways does not approach more than 50 miles.

Present Disgraceful Conditions.

What are we to do? In our big cities we are running street-cars on the surface, trains on elevated railroads and down in the subways. The more roads we build, the more acute becomes the shortage of transportation as far as passengers are concerned, and in any big city transportation facilities are always woefully behind the actual demand. In the morning everyone goes to business about the same time and in the evening everyone must ride home—our so-called rush-hours. The density of travel thus become enormous, particularly in cities like New York or Chicago, where conditions, as is well known, are intolerable, and in many cities, disgraceful. If it were possible to operate our railroads with safety only two or three times as fast as they are running now, it stands to reason that everybody would have a seat, an impossible condition now.

We cannot run our trains faster than they run now without encouraging accidents such as collisions, derailments, etc. As far as the present day railroad is concerned, it is not possible to increase its speed at all. There is, however, one solution, an invention which dates back to 1852. we refer to the *Gliding Railroad* which actually had been tried in France, and had been perfected in a small way. At that time, however, many technical obstacles made the project impossible, but all of these objections have now been overcome by new inventions and methods which we will discuss more fully.

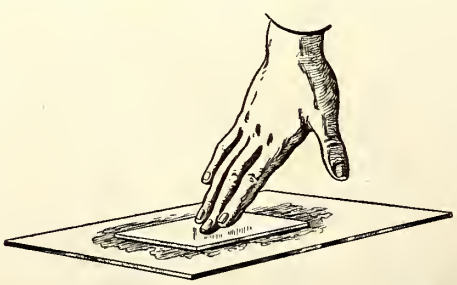

Fig. 1. The Principle of the Gliding Railway. Two Glass Plates Are Dipt Into Water. The Upper Plate Will Glide With Astonishing Ease. The Two Plates Do Not Touch. A Thin Water Film Separates Them.

Principle of Gliding Railroads.

Let us turn to Fig. 1 which gives us the principle of the gliding railroad. Take two smooth pieces of glass, such as are used for photographic plates. Boil them in water, until the gelatin comes off and clean thoroly. Use one large plate and one small plate as shown in illustration. Dip the two plates into water, and place the small plate on top of the larger. It will be seen that the small plate will *glide* with remarkable ease over the large plate. The important thing to note is that *the two plates do not touch.* They are supported by a thin film of water, *hence the top plate glides on an exceedingly thin water film.* As we move the plates back and forth we squeeze out the water little by little, and as soon as the plates touch, the free movement will stop. Were we to drill a hole in the top plate and attach a small tube to it containing water under pressure, we could then for a long time move the plate back and forward with very considerable ease; we would then always maintain a good water film on which our top plate could glide.

Exactly this is the principle of the gliding railroads, first invented by L. D. Girard, a great French engineer. Already in 1852 M. Girard proposed to replace the ordinary railways by means of hydraulic propulsion. He was quite successful with

www.americanradiohistory.com

his first models and in 1854 he conceived the idea to replace the wheels by means of *hydraulic skates* gliding over flat rails. By means of this method, he did away entirely with all friction for the reason that *he interposed between the skate and the track a film of water under pressure.* At first M. Girard was using comprest air, but he found that it was necessary to use water under pressure because air did not give satisfactory results.

Railroad was Actually in Use.

He actually constructed on his property de la Jonchère, near Paris, such a wheelless railroad which had no locomotive, the cars of the train gliding on a film of water. The propulsion of the train itself was affected by a sort of turbine arrangement whereby a stationary water jet was hurled against stationary vanes mounted under the cars. In other words, the train acted as the stationary part of a turbine, while water jets placed alongside the road, and operating automatically, pushed the train along. This railroad worked very well and actually transported passengers in a limited degree. In 1869 M. Girard obtained a concession from the French Government to run a wheelless railroad line from Paris to Argenteuil. Unfortunately, the Franco-Prussian War in 1870 then broke out and his experimental railroad at de la Jonchère was ruined by the Germans and Girard himself was killed. Nevertheless, the principle had been proven sound by actual practise. There is no reason why with modern methods and improvements it cannot be made a huge success.

In our Fig. 2 is shown one of Girard's hydraulic skates or shoes and its operation. M. Girard's train had two *flat* rails, and each car had four hydraulic skates or shoes which replaced the usual wheels. Fig. 2 shows three views of the shoe. It will be noted that water pressure is supplied to the shoe which fills the interior fully. As soon as the pressure becomes high enough, it is obvious that the water must escape by raising the shoe clear from the rail, providing enough pressure is used. While the water escapes, it will be readily understood that the shoe itself can nowhere touch the rail proper. In other words, *the shoe floats on a thin film of water.* If no other means were provided, it can be seen that an enormous quantity of water would be needed to supply the hydraulic shoes, while the train was moving, or even standing still. The water would squirt out incessantly.

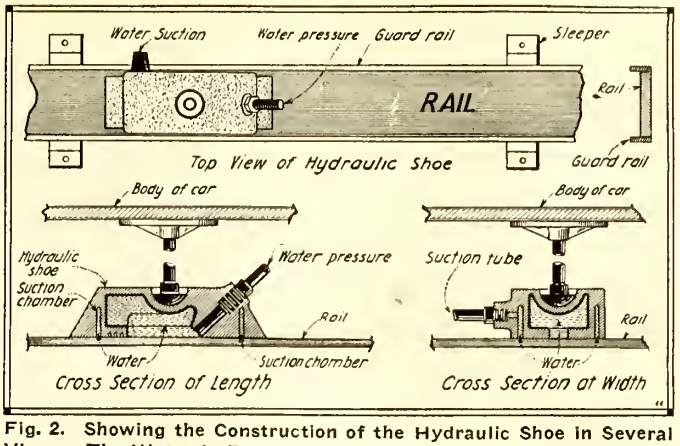

Fig. 2. Showing the Construction of the Hydraulic Shoe in Several Views. The Water Is Pumped Into the Shoe Under High Pressure. As the Water Leaves the Shoe, It Is Sucked Back Thru the Suction Chambers. The Hydraulic Shoe Cannot Leave the Track On Account of the Guard Rails. (See Upper Right Hand Detail Sketch.)

No Water Is Lost.

However, another French engineer, M. Barre had the happy idea to recover nearly all the water, and this arrangement is also shown in Fig. 2. Running near the edge of the hydraulic shoe will be found an annular suction chamber which is connected to a suction tube. It will be realized that as quickly as the water is prest out from under the shoe, it must pass the suction chamber, *and here it is sucked back to the water reservoir* of the train to be used all over again. With this ingenious arrangement, it will be readily seen that practically no water is lost except a minute quantity used in wetting the rail, and this loss per train amounts to only a gallon or two per mile, even for a heavy train.

A very important, and as a matter of fact, the most important part of this railway is, that as the cars glide on water they *can be made to run with marvelous ease.*

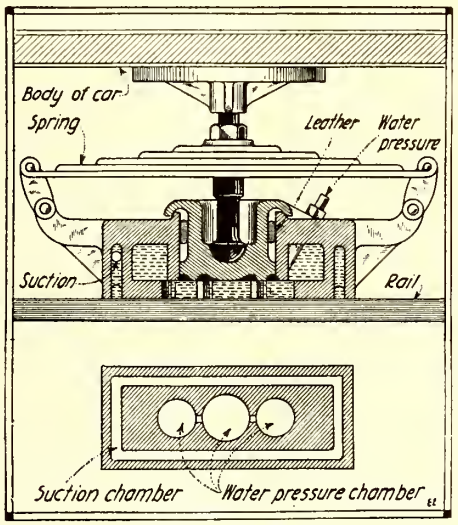

Fig. 3. A Modified Form of the Hydraulic Shoe. It Works Similarly to the One In Fig. 2. Note the Piston Arrangement Which Gives the Train a Feathering, Cushion Effect.

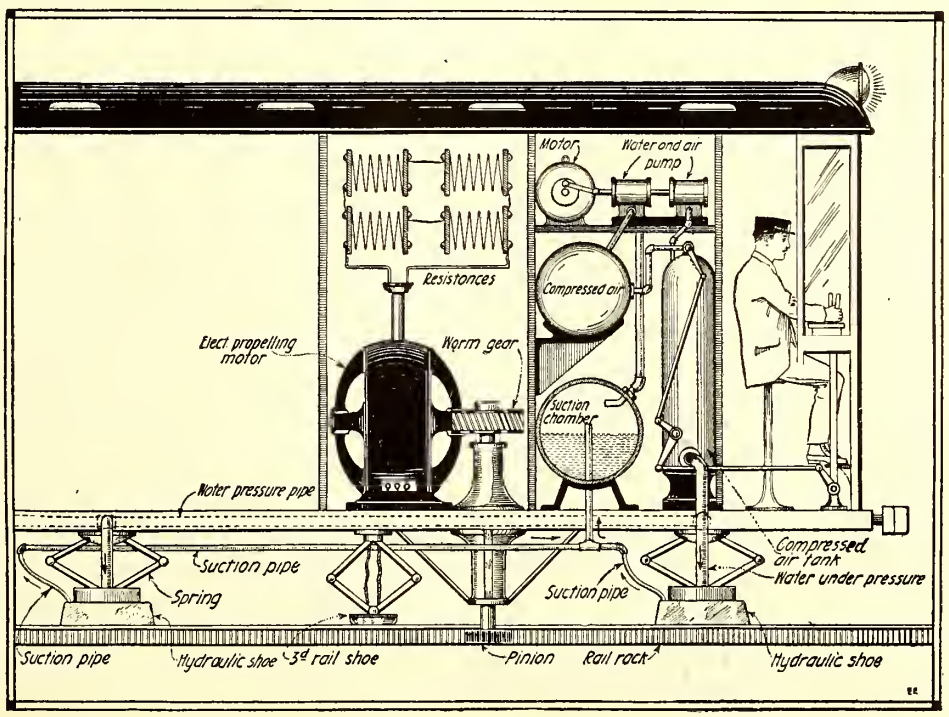
Child Can Pull Train.

M. Girard already demonstrated that *a six year old child could move a standard railway car* rapidly over a track, so easily does such a railway operate. The reason is of course that no metal of the train touches the track, therefore nearly all friction is suppressed. By actual experiments it has been shown that M. Girard's cars could be moved with a weight *one half of one thousandth of the weight of the car.* In other words, a railroad car weighing several tons can be pushed along rapidly with an expenditure of a few pounds of energy. The water film itself is of course exceedingly thin, measuring only from one-half to three-quarters of a millimeter. In other words, not much thicker than six sheets of paper on which this story is printed. Nor was the water pressure as high as one might think at first:—10 lbs. per square centimeter.

M. Girard found his greatest trouble in two points. First, he had trouble with his rails at the point where the latter connected. It is of course necessary that a railway of this kind should have an exceedingly smooth metal rail which must not have any uneveness whatsoever. Also where the rails join, it was found necessary to interpose pieces of leather or soft rubber, otherwise the water would squirt out between the rails. Of course, we would not have this difficulty today because we would simply weld the rails together, making them a uniform piece of metal. This source of trouble, and it was M. Girard's greatest one, would be unknown today. The other great difficulty was to propel the train.

How to Propel Wheelless Trains.

There was used in Paris at one time an arrangement as shown in Fig. 4. Inasmuch as no wheels are used, and because the hydraulic shoes have no tractive effect themselves, entirely new means must be provided to move the train. The old French idea is shown in this illustration where a rail rack was run all along between the (*Cont. on page* 336)



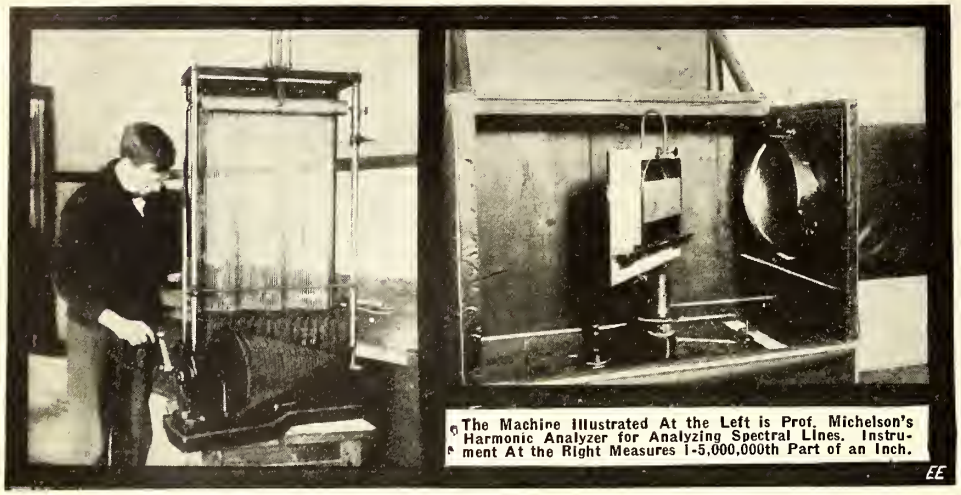


Fig. 4. Showing the Propulsion Used in the early French Gliding Wheelless Trains. A revolving Pinion Engages with a Rail Rack, Thus Pushing the Train Along. Illustration Also Shows the Method of Hydraulic Shoe with Comprest Water, and How the Lost Water Is Sucked Back.

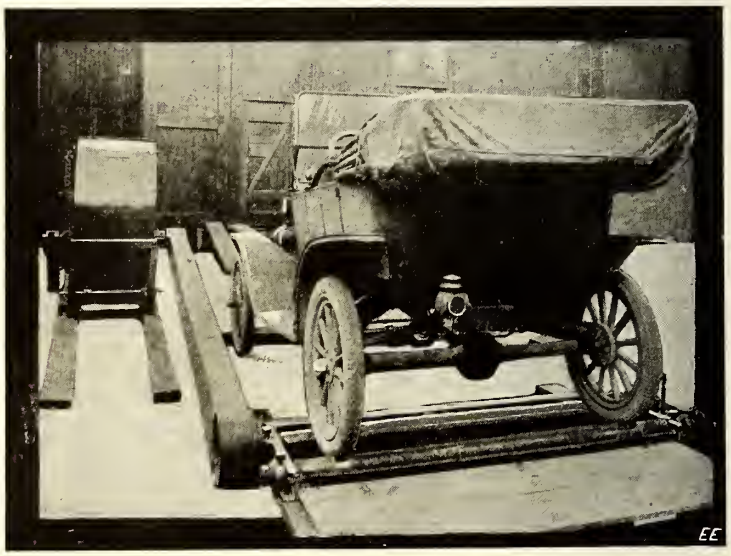
Measuring 1-5,000,000 of An Inch

The Machine Illustrated At the Left is Prof. Michelson's Harmonic Analyzer for Analyzing Spectral Lines. Instrument At the Right Measures 1-5,000,000th Part of an Inch.

The wonderfully precise measuring machine here illustrated measures down to 1-5,000,000 of an inch. It was invented by Prof. G. Michelson. Prof. Michelson's grating (on the stand to the left) contains 50,000 parallel, equally spaced lines to the inch.

Precision to the 1/1,000,000th part of an inch has until recently seemed only to be within the realm of ultra-science, as we might say. However, during the war, mechanical precision instruments were improved so markedly that it was quite common, especially in Government ordnance specifications and requirements which called for an accuracy of 1/1,000,000th of an inch.

The photo at left shows Prof. Michelson's Harmonic Analyzer, for analyzing spectral lines into their constituent parts. By means of this device an assistant can do in a few minutes what would require many weeks for a skilled computer.



Farmers Drive Machinery from Automobile

Herewith is illustrated the latest in automobile power transmitters for driving farm or other machinery. A recent invention of the proprietor of a Colorado machine shop promises to become very popular with farmers who own autos. The invention is an apparatus for transmitting power from an automobile to run the machinery of the farm, but unlike most contrivances of its kind, nothing is removed from the auto, and the auto can be driven off within a minute of the time it is used on this new invention.

The device consists of two four-inch rollers set parallel to each other in a frame and long enough to run the automobile onto them. These rollers are connected by a chain belt, and on one of them is a pulley to run a belt to the machinery. The rollers are locked against turning while placing the auto on the machine, by putting an iron pin thru the links of the drive chain. When the rear wheels of the auto are resting squarely on the rollers, pin is removed and the engine started. This turns the rollers as the wheels revolve, and the belt runs the machinery, the same as any other power would do.

The inventor claims to develop half the rated horsepower of any automobile engine on the belt of the machine, which is very good indeed, considering that the power is transmitted by friction only, with a consequent loss by slippage. The device should find wide favor among farmers everywhere.

Here's How to Put Your Henry Ford to Work and Make It Drive Farm or Other Machinery—even Down to Cutting Up Fire Wood. The Inventor of the Automobile Power Transmission Scheme Here Illustrated, Claims to Develop Half the Rated Horsepower of an Automobile Engine on the Belt of the Machine, Which is a Very Good Efficiency Indeed, Considering That the Power is Transmitted by Friction With a Consequent Considerable Loss, Due to Slippage. The Device Comprises Two Four-Inch Diameter Rollers, Set Parallel to Each Other, in a Frame Long Enough to Permit the Rear Wheels of the Automobile to Rotate In Contact With Them.

"Movie" Sign Works by Colored Lights

This Picture is not Quite so "Infantile" as it Might Seem At First Glance, Altho the Subject Illustrated Happens to Be. By Painting Two Objects Such as a Hobby-Horse as Here Shown, in Two Different Colors, Say Red and Green, a San Antonio, Texas, Inventor, Richard M. Craig, Has Found That When a Set of Red Lights Are Flashed on the Sign by a Special Electric Flasher Switch, the Red Image Stands Out Plainly; and When the Green Lights Are Lighted and the Red Extinguished, the Green Image Stands Out. By Rapidly Switching the Lights On and Off a "Movie" Effect is Obtained.

One of the lastest and cleverest advertising devices is that covered in a patent recently granted to Richard M. Craig of San Antonio, Texas. The inventor arranges two figure positions on the sign, one position of the figure for illumination by red lights and the other by green lights. Next he arranges red and green lights for illuminating the display with a device for alternately switching the current from one set of lamps to the other, the switching device being motor-driven. In the present illustration, we at once perceive that the subject is painted twice in two extreme positions, each position being painted in a different color, such as *red* for the extreme position and *green* for the second extreme position. These two positions in red and green under ordinary daylight conditions show plainly, but when they are lighted alternately with red and green lights, then the sign becomes alive and animated, giving a very near approach to a moving object.

Two Views in Paris, Showing the Famous "Camelots" or Street Fakirs, Who Have Here Elected to Tell the Good French People Their "Past, Present and Future" by Wireless. Only it Isn't Wireless!

Paris Letter

By JACQUES BOYER

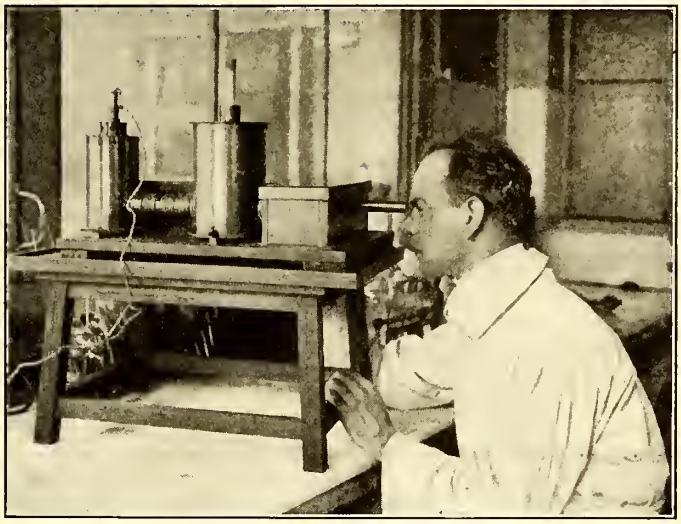
THE Parisian "camelot" is more than a street peddler, he is a business man and an actor, sometimes even an acrobat, but always he is a marvelous talker and a humorous entertainer.

A good "camelot" will sell anything on the asphalt of the good town of Paris, be it an old sponge, a pocket-book, a collar button, or ice-cream. We have no intention to give in the following, a history of this so interesting specimen of human being, but we will show, with the help of the photographs herewith, that the renown of the "camelots" is by no means exaggerated and that they keep abreast with the developments of science and are not at all indifferent to the particular trend of public attractions. These peculiar peddlers, instead of meddling with ordinary merchandise have put the fairy Electricity at work to attract their clients.

Here for instance, one of them detects your thoughts by means of the *"Teleradio"*; the other one uses the *"Radiograph"* to discover the past, present and future.

Of course we don't need to tell you that the instruments which they exhibit have only a very vague resemblance to the ones attributed to Tesla, Marconi or Branly.

Most of the time these apparatus consist solely of a bell connected to a few dry batteries and other formidable appearing scientific apparatus. The answer to the question concerning the past, etc., of the victim, is printed in advance, of course, and glides out of a box by means of a clockwork.



The rest is *camouflage. Scientific camouflage.* But some one always falls for the fakes. P. T. Barnum was right. The public wants to be fooled—and gladly pays for it.

New Electrical Apparatus to Count the Microbes.

The Opacimeter.

This new instrument invented by Messrs. Lambert, Vles, and de Watteville, who have given it the name of *Opacimeter*, makes it easy to count rapidly the microbes in an emulsion prepared for vaccination purposes.

It is composed principally of a photometer made up of two parallel light circuits, coming from one source, the one traversing the phial containing the emulsion, the other subject to a system of dimmers, capable of modifying the intensity of light, after a determined law. The two circuits produce, in the field of an eye piece, two light-spots opposite each other and the other realizes their equal value by adjusting the dimmer system.

New French Instrument for Rapidly Counting the Microbes in an Emulsion. It is Called an "Opacimeter."

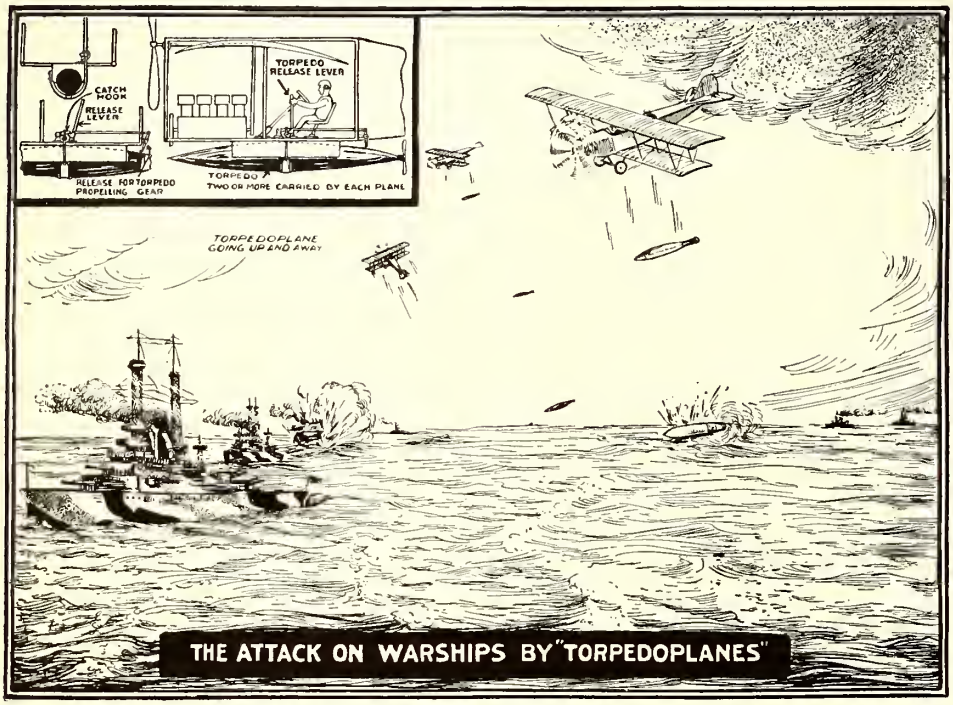
A very ingenious system of gauges, lenses and microscopes, the detailed description of which it is not possible to give in this limited space permits the observer to establish with the aid of Spectrophoto-Metric Measures the actual number of microbes contained in the emulsion. The laboratories of the French Army are using the Opacimeter to determinate rapidly and accurately the dose of bacteria to be contained in a vaccinating emulsion.

SHELL LOCATER FOR FRENCH FARMERS.

The shell locating apparatus here illustrated was invented by M. Gutton, Professor of Physics at Nancy, and is akin to one used by surgeons for locating bullets in the body. It consists of two wooden rings each fitted with a pair of electric coils, one traversed by a variable current and the other connected with a telephone. If there is a metal object under the soil in fairly close proximity to the apparatus, the telephone signals the fact; if not, it remains silent. Unexploded hand-grenades are more dangerous than shells, as they are nearer the surface, and liable to burst at the least touch. This apparatus operates on the principle of the Hughes Induction Balance.

The Hughes induction balance is composed of four coils, two in the primary and two in the secondary circuit. When the relative positions of the coils are adjusted correctly, the inductances neutralize each other and no current flows in the secondary circuit. If, however, the slightest change is made in any of the coils, such as by the insertion of any metal object, the mutual induction is unbalanced and a sound is made in the telephone receiver. A detailed description of this device appeared in the February, 1918, issue of this Journal, where a diagram is given of the coil connections. The secondary coils may be connected in series with a galvanometer or 'phones. An experimenter who has no galvanometer can purchase an inexpensive Weston ammeter. When the shunt has been removed, this will serve as an excellent galvanometer. Some form of interrupted primary circuit is necessary to induce currents in the secondary. An interrupter, mounted on the armature of a buzzer, serves the purpose.

The Fields of France Are Strewn with "Dud" Shells. To locate them Before Plowing, the Electrical Instrument Here Illustrated Has Been Perfected to Detect Their Presence, Even When Buried Several Feet.



www.americanradiohistory.com

The "Torpedoplane" and "Sub" Spotter

By GEORGE HOLMES

TWO important and novel war inventions are here illustrated and described—the torpedo-carrying seaplane or dirigible, and the microphonic submarine locater, both of these naval warfare improvements being the inventions of an American naval officer, Rear Admiral Bradley A. Fiske.

Two Revolutionizing Naval Inventions of Rear Admiral Fiske

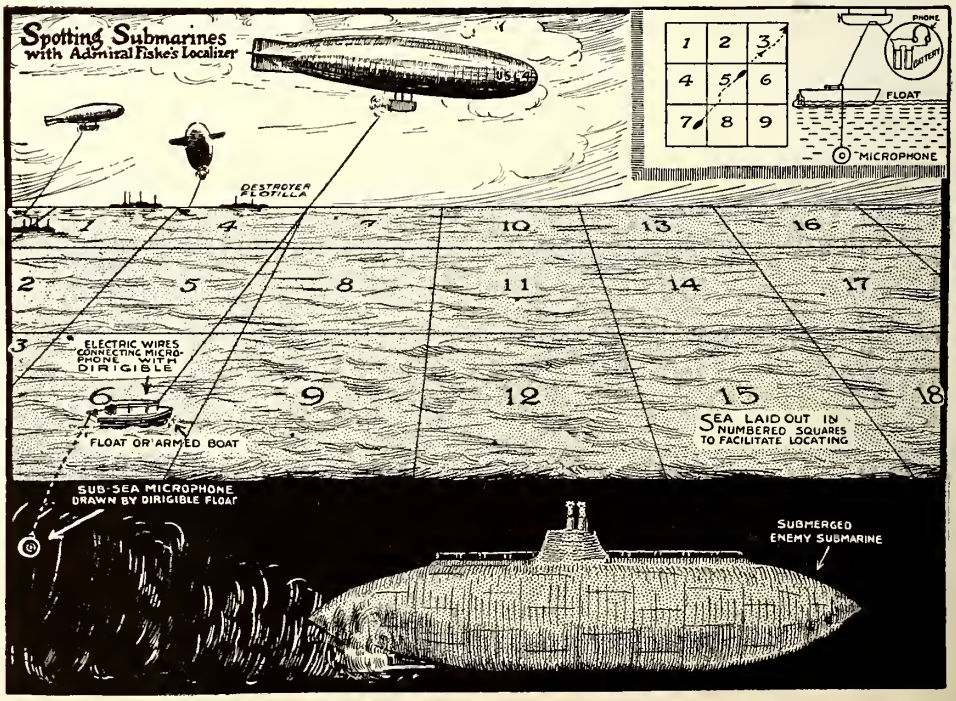
The Naval Engagement of the Future as Rear Admiral Fiske, U. S. N., Sees It. His Powerful "Torpedoplanes" Will Provide New Ways to Repulse Landing Parties and Attack Warships That Are Worrying Naval Experts of Foreign Powers.

The torpedo-airplane or "torpedoplane" as it is called, is a development of the torpedo-carriers, which were first successfully employed in action by the R. N. A. S. at the Dardanelles in 1915, and were subsequently used against us by the Germans in 1917, when they were thus enabled to sink three of our merchant ships off the Southeast Coast. The torpedo carried by the torpedoplanes is of a small size as modern torpedoes go, and weighs about half a ton.

The Mystery Plane or "Torpedoplane"

The "mystery airplane" was designed to perform from the air more effectively and more swiftly the work formerly allotted to our torpedo-boats. The enemy had devised such successful protection of harbors and ships against our torpedo-boats and submarines that it was only with the gravest risk that we could approach within 30 miles of Kiel and other German fortified ports. But for the newest peril, the torpedoplane, the enemy had no reply.

The news of our discovery of a means of attack that was immune from mine dangers and too swift in its operation to be held off by gunfire reached the ears of the enemy, and is believed, in one quarter at least, to have hastened the Germans in their decision to accept the surrender terms.



Had not hostilities ceased so suddenly these machines would have operated effectively against Kiel harbor and the German warships in their very lair. The efficacy of the weapons will be realized when their operation is explained. One of these mystery airplanes, espying its target, makes a sudden dive from the clouds, at a speed of 150 to 200 miles an hour, levels out at 50 feet above the surface, discharges a torpedo directly at the enemy ship at the right moment, after which the pilot pulls back his control stick and disappears into the clouds as suddenly as he appeared. The operation is so swift that the enemy has little if any chance of training a gun on the assailant. The "smoke cloud" produced by modern war planes is excellent for this purpose. In one of these attacks a British airman torpedoed and sank a Turkish troopship containing 3,000 troops.

When the idea was first conceived of having an airplane to carry an ordinary torpedo such as is used on the submarine, technical difficulties almost defeated the project, until an American designing firm got hard at work in conjunction with the Air Ministry. The difficulty was not so much of lifting a torpedo as of ensuring that the action of discharging the torpedo be carried out with accuracy of aim and with safety to the pilot. Experiments were carried out in the face of great difficulties and perils.

On the occasion when the initial experiment of discharging a torpedo from an airplane was made, the lightening of the airplane had such a serious effect on the latter that the wings collapsed and the pilot was hurled to sudden death. In another case when the torpedo had been discharged, it hit the water at an awkward angle, and ricocheting over the surface, rose and demolished the airplane, which had not risen out of the way. This discharging of a torpedo was no light risk when the torpedo was of full size, weighing anything up to a ton—three times the weight of the machine in which Blériot first crost the English Channel.

These wonderful planes can ascend from land or from the deck of a ship, and can descend on the sea and float until help is brought by wireless. When the German fleet surrendered, a seaplane "mothership" with 20 of these machines in its bosom met the Germans 50 miles out at sea, and had any tricks been tried, it would have been simple work for a score of "mystery airplanes" to have leapt into the air and torpedoed the major part of the enemy fleet. This mystery or "cuckoo" airplane—so

Thunderstorm Electricity

By ROGERS D. RUSK, M. A.

Late of the Meteorological Section, U. S. Army Signal Corps.

ONE hundred and fifty years ago the famous Voltaire said: "There are some great lords whom we should always approach with extreme precaution, and lightning is one of them." This is perhaps one reason why we know so little about lightning at the present time, for it certainly is not a very safe subject for close laboratory investigation. For a long time after the electrical nature of lightning was demonstrated by Benjamin Franklin, very little more of any scientific importance was discovered about it, and only today are we learning how the great charges of atmospheric electricity are generated in a thunder-storm. It is a significant fact when we think that a thunder-cloud is the most stupendous and powerful generator of electricity of which we know. A single lightning flash may carry *twenty thousand or more amperes at a pressure of millions of volts.* Moreover it is Nature's own method, the simplicity of which makes it the more wonderful, for it involves no intricate and complicated machinery. It is not too much to think that the future will sometime see Man harnessing and making use of this tremendous source of energy and bidding it do his will instead of holding it in awe, as he so long has done in the past.

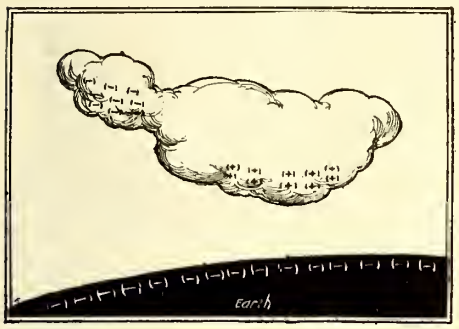

Fig. 1. Showing How a Cloud Is Charged by Electro-Static Induction. The Negative Charge on the Earth Induces an Opposite Charge in the Cloud.

During the war lightning and thunder-storms proved a serious menace to balloonists and aviators, and on this account they were made the subject of special study by the *Meteorological Section of the Signal Corps.* Their results, in connection with the latest discoveries of scientists in general, are now beginning to throw light on the long hidden mysteries of thunder-storm electricity.

In recent years many theories have been advanced to explain the cause and nature of lightning, but all of them have been more or less vague and indefinite and for the most part they have been unsatisfactory one way or another. Electricity is now recognized as being one of the important factors in the determination of weather conditions, and conversely, weather conditions are very definitely known to determine the electrical state of the atmosphere at any particular time. *Sometimes rain produces electricity, and sometimes electrical phenomena cause rain.* The place where the two, rain and electricity, are most closely related is in the thunder-storm. Here the rain drops condense primarily about small electrically charged particles called *ions,* and then again the motions of these particles cause the growth of the lightning charges in a manner to be explained more in detail.

The Physics of Thunder and Lightning Simply Explained

How Thunder-Clouds Form.

In a thunder-cloud the almost inconceivably large charges of electricity are often generated in a very short space of time, and sometimes a complete reversal of sign from *positive* to *negative,* or vice versa, may occur in a *thousandth of a second or less.* It is usually thought that lightning discharges occur from one cloud to another or from a cloud to the earth, but this is not necessarily the case. Quite frequently discharges *as long as a mile in length* will take place in the interior of a single cloud itself. For these reasons it must be explained just what a thunder-cloud is, and how it differs from other clouds which seldom carry charges of electricity of any great magnitude, or act in the capacity of electric generators.

WHAT TO DO IN A THUNDER-STORM

If you are out of doors in a very severe electrical storm, it is well to observe the following rules for your own protection:

1. Keep away from wire fences. They may carry a dangerous electrical charge long distances. Cattle in pastures are frequently killed thru the neglect of farmers to ground the wire of the fence.

2. Keep away from hedges, ponds and streams.

3. Keep away from isolated trees. Oak trees are frequently struck; beech are seldom struck. It is safe in a dense forest.

4. Keep away from herds of cattle and crowds of people.

5. Do not hold an umbrella over you.

6. It is safer to sit or lie down in an open field than to stand.

7. Drivers should dismount and not stay close to their horses.

8. Do not work with any large metal tool or implement.

If you are indoors:—

1. Keep away from the stove and chimney. The hot gases from the chimney may conduct the lightning to and down the chimney.

2. Do not take a position between two bodies of metal, as the stove and waterpipe, for example. An exception to being near metals is the case of an iron bed. One of the safest places is on a mattress in an iron bed, provided you do NOT touch the metal. The metal surrounding you makes a safe cage, which will prevent the lightning from reaching a person inside.

3. Do not stand on a wet floor nor draw water from the well or faucet.

4. Do not stand directly under a chandelier, near a radiator, nor on a register.

5. Do not use the telephone in suburban districts. In cities there is practically no danger, as the wires are placed underground.

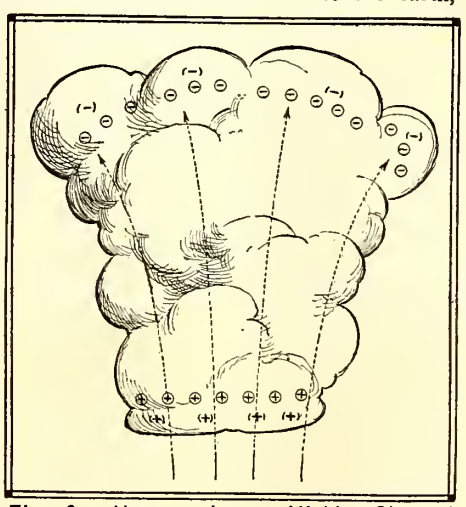

Fig. 3. How a Large Highly Charged Thunder-Cloud Forms by a Continual Shifting of the Oppositely Charged Particles Composing It. The Negative Charges Tend to Move Toward the Top, and the Positive Charges Toward the Bottom of the Cloud.

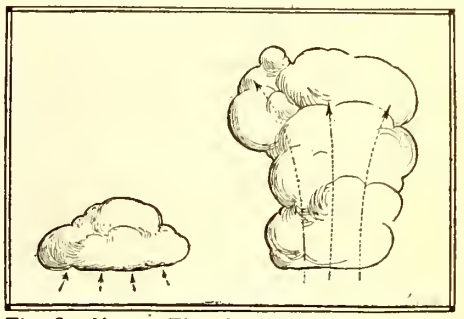

Fig. 2. How a Thunder-Cloud Grows. The Larger Cloud Is the Result of Intense Local Heating and a Strong Up-Rushing Current of Air. Its Height May Be a Mile or More from Base to Top. The Smaller Cloud May Measure Only a Few Hundred Feet in Height.

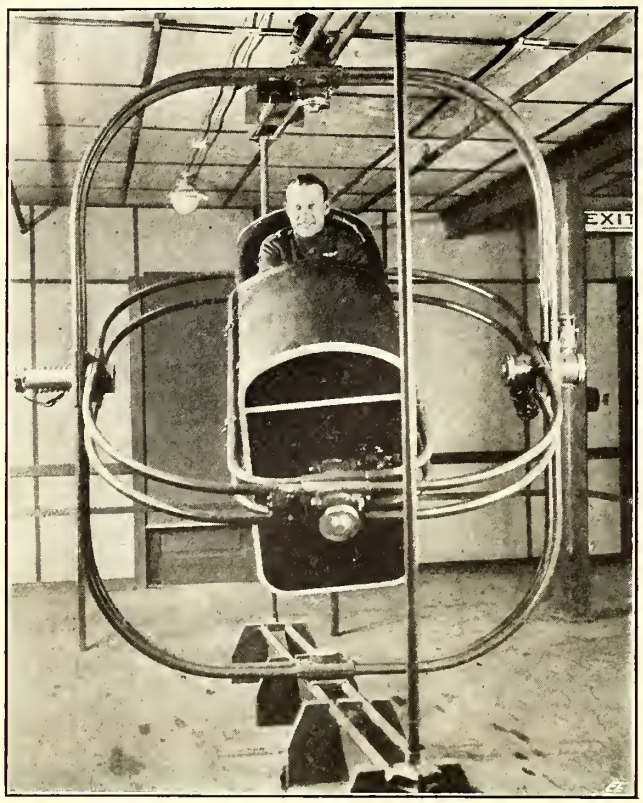
Everyone is familiar with the huge rolling, billowy clouds (cumulis) so common on a warm day, but not everyone knows how they are formed. In reality each cloud represents a column of heated air which has risen by convection from the earth's surface, due to the heating effect of the sun, and has carried moisture up with it. When the top of this column has risen to such a height that it begins to cool, and the moisture to condense, the cloud is formed. This may seem unimportant but in reality it is the beginning from which a thunder-storm may develop, if conditions are just right. As moisture in the air does not condense in the form of drops unless there are dust particles or electrically charged particles (ions) in the air to act as centers of condensation, the cloud may already have received a charge from these ions, providing there was a majority of ions of one sign present.



How Clouds Receive Charge.

A cloud may also become charged by *induction.* If a cloud which has approached the earth as shown in Fig. 1, is of a form which may divide into two parts, the charge of the opposite sign which has been attracted to that portion nearest the earth may be carried away by it at the time of division, and the other portion of the cloud may carry away a charge of the same sign as the earth. Neither of these two ways in which a cloud may become charged, explains however the production of the enormous charges which are present in a thunder-cloud. These are produced in another way, due to the forces at work when a thunder-cloud is formed.

If the heating is intense and there is much moisture present, when the billowy clouds mentioned above are formed, the result is a thunder-cloud. The process is shown in Fig. 2, where the smaller cloud is the common type visible on most any warm summer day. The larger cloud is the result of intense local heating and a strong up-rushing current of air, and its height may be a *mile or more from base to top,* while the smaller type may be *only a few hundred feet in height.* The bulging tops of the larger clouds are the common-

Above:—The Meissner "Airfone" for Talking Between Pilot and Observer. It Amplifies as Well as Localizes the Speech Waves. At Left:—The Ruggles "Orientator". It Is Electrically Operated and Gives All the Thrills of Real Flying.

"Ground Flying" for Aviators

This machine is used to familiarize the student aviator with the various loops, turns, cuts and dives that every flier must know. One can loop the loop, take a nose dive, make a tail spin and execute the "falling leaf" by simply operating the various electric controls. The invention is now being used with greatest success by the young army officers learning the elements of the flying art at the Army's flying school at Washington, D. C. The Orientator may be controlled by a switch-board at the side but on the floor, so that when desired the instructor may put the student thru various flying maneuvers at unexpected moments.

How Pilot and Observer Talk

The airfone is a form of speaking tube designed especially for service as inter-communication device between pilot and observer, instructor and student, or any airplane occupants, during full power flight. It consists essentially of a flexible speaking tube provided with a mouthpiece and a neck band, and of a helmet to which two earpieces are attached, suitable connections between the speaking tube and the earpieces being provided. For two-way conversation, two such head gears and tubes are used. Its present design is based on a very close and detailed study of aircraft noise conditions and in the application of acoustics.

Electric Brush Contains Dynamo

We are all more or less familiar with the various faradic electric appliances such as massage rollers, brushes, et cetera, which can be used in connection with medical coils and the like, but one of the most interesting and withal extremely efficient electric devices recently brought out is the Electro-dynamo Brush shown in the accompanying illustrations. It is claimed for this brush that it will rejuvenate the hair, and the makers cite the testimony of experts that it will in many instances help the scalp and also aid in the treatment of a great many ailments. In treating other parts of the body than the scalp, use is made of a flexible conductor and various electrodes which can be quickly attached to the brush. No batteries are required and a powerful current is generated as soon as the projecting finger lever is gently prest. This brush was tested by one of the leading New York electrical testing laboratories, and their report states that it develops an average potential of about 50 volts, and a peak value of from 100 to 200 volts. It is therefore impossible to receive an injurious shock from this unique device.

Young Lady Using the Newest Electric Hair Brush. On the Back of This Brush Is Mounted a Tiny Dynamo Operated by Pushing the Trigger.

A New York physician, Dr. H. J. Lowbringer, expresses his opinion on the electric brush as follows: "This little dynamo is therefore more than a scientific curiosity, because it generates currents of very high voltage with an amperage of infinitesimally low strength; consequently the results of application are similar to one of high frequency current, and thoroly superior to the ordinary faradic battery or the galvanic current, in instances where either diathermic or catalytic results are intended." With this electric brush and the attachments furnished with it, it is possible to give an excellent face massage, the current passing thru the hand of the massager. Also electric foot baths may be taken, or the current, in fact, past thru any part of the body, such as in the treatment of rheumatism, nerve disorders, etc. There is nothing in the device to wear out. The strength of the current may be varied by a regulator on the back of the brush, and it is also controlled by the rapidity with which the finger lever is prest and released. The device is well built.

Application to the Scalp With This Electric Hair Brush Is Said to Revitalize the Hair Roots and Tone up the System.

Inside of a U-Boat

Details of Machinery Found in the Surrendered U-Boats

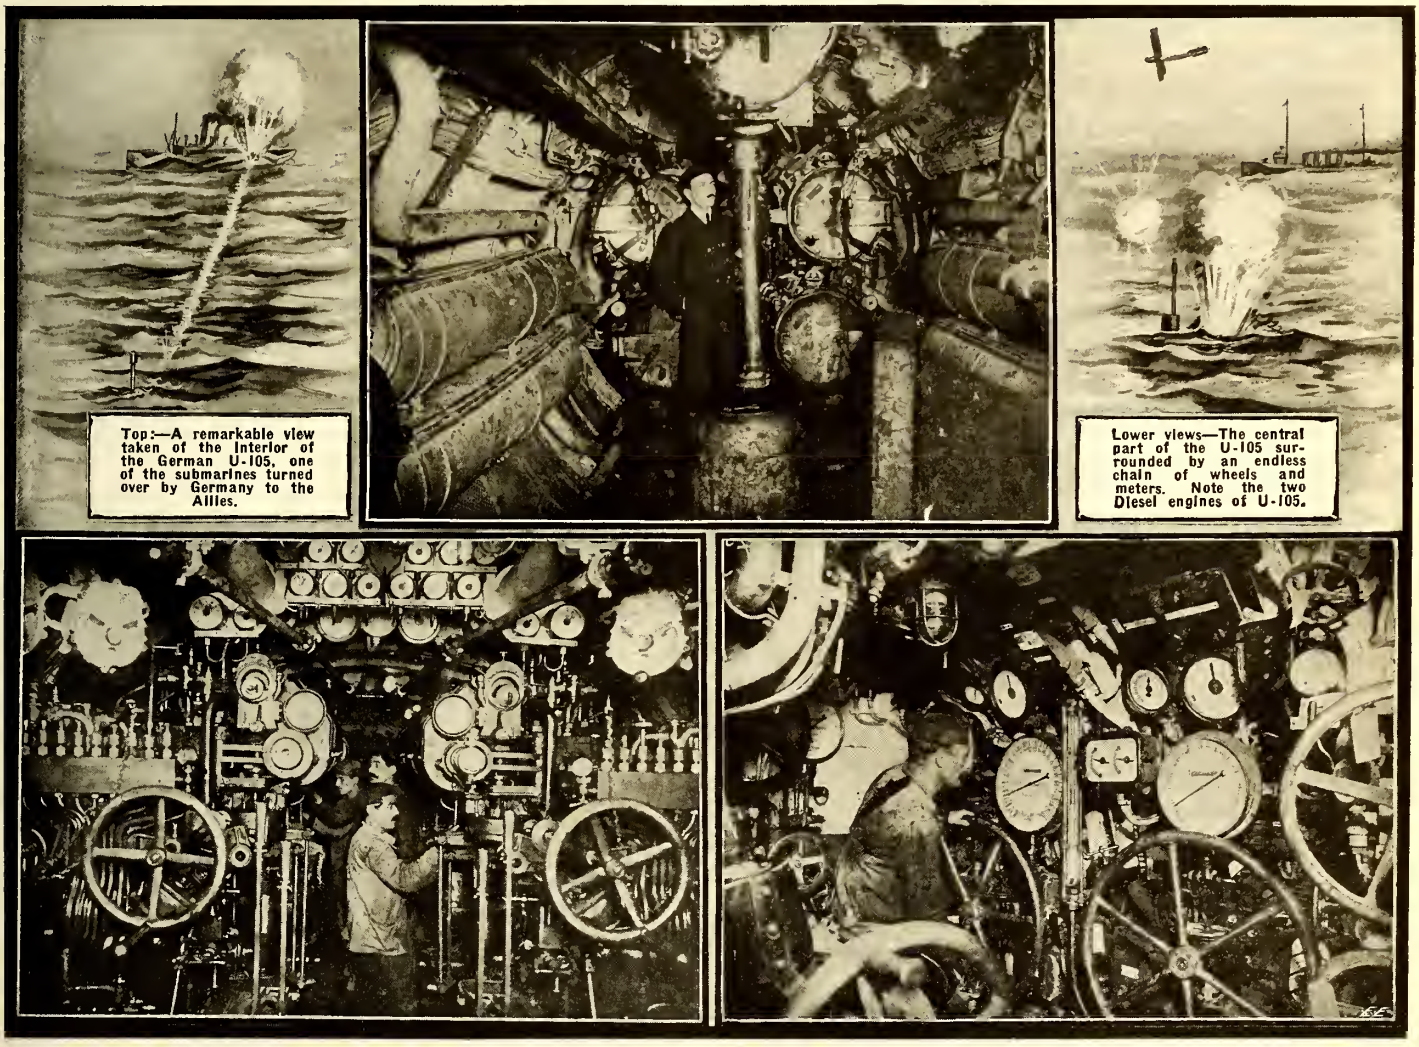
OWING to the extent and the manner in which it was used by the Germans to attack commerce, the submarine emerged from the war a rather discredited weapon. This is not to say that it was discounted as a legitimate fighting instrument, and the question is being discust in Allied naval circles as to whether, and to what degree, the type will be included in the plans of naval constructors for the fleets of the future.

An answer to the question has its importance because of the possibility of the peace conference being asked to consider the desirability of abolishing submarines altogether. Even if the conference did not touch the matter, it was expected to be one of the first plans for the general reduction of armaments which, in accordance with schedule 111 of the League of Nations covenant, the council would suggest to the member states concerned.

Professional opinion, in all the nations engaged in the war on the side of the Allies, so far as it is confined to the men concerned in the actual fighting, inclines to the view that the submarine was beaten. There have been clear expressions on this point in Britain, America, France, Italy and Japan. Admiral Sims, for instance, declares that 205 U-boats were sunk by the Allies during the war. Altho this was not known until information had been obtained from German sources after the surrender. He also says that the grand fleet, when cruising in the North Sea, was surrounded by a screen of destroyers so intimately placed that it would have been suicidal for any submarine to attempt to penetrate it.

When such a screen was out, a submarine had to go down and stay down on penalty of being "depth-charged."

Altho the German high command to the end profest faith in the submarine war on merchantmen, Captain Persius has declared since the armistice that this faith was built up on "lies" spread about by the naval chiefs, as to the powers of the U-boats.



Submarines Have Advantages, Say Naval Experts.

On the other hand a significant indication of the utility of submarines for scouting duty has been afforded by Lord Jellicoe's recent book. He shows therein that not until June, 1916, was it possible to maintain a regular submarine patrol off the Horn reef (Denmark), by two or three submarines. By that time, the range of wireless equipment in the British submarines had been increased from 50 miles to 300-400 miles. "It was a vital matter," says the commander-in-chief, "to install efficient wireless apparatus in the only class of vessel that could carry out a watching patrol in the vicinity of German bases."

While, therefore, there are many strong reasons for desiring the abandonment of submarines as they were used by the Germans, yet equally strong is the professional opinion that under-water craft have not been rendered entirely useless by the inventions directed against them in the war, and that in any case they form a necessary adjunct to any complete naval organization of the future.

What the inside of a German U-boat looked like was a complete mystery to the layman until quite recently when several of the Ex-Kaiser's *unterseeboote* "visited" this country under the guidance of American crews. These sub-sea craft were piloted 3,000 miles across the Atlantic to aid in putting over the Fifth Liberty Loan. The first captured U-boat to reach these waters, flying the American flag, was the U-111. A few days later the mother ship "Bushnell" arrived at New York with several other

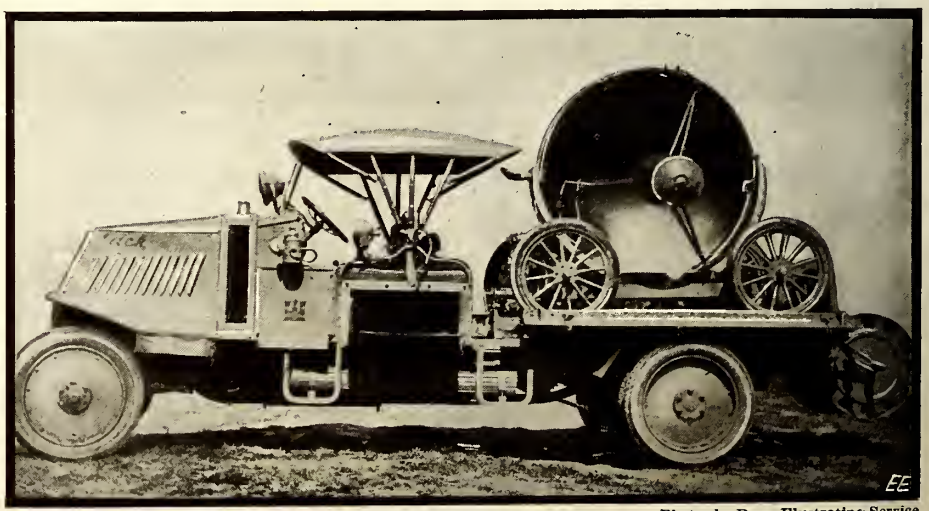
Locating Airplanes in Night Fighting

THE photograph herewith of the large Paraboloid reflector with two soldiers standing at either side, and equipt with special head phones, which are connected with the sound detecting apparatus mounted in the central focus of the reflector, is employed for locating the direction of approaching hostile aircraft at night. The reflector is balanced and pivoted so that it can be rapidly swung to any angle desired. When the approximate location of the approaching aircraft is determined by means of this sound wave catcher, then powerful searchlights are suddenly flashed on, and their beams pointed in the direction previously indicated by the sound detector. The range of this sound detector, owing to its efficient design, is said to be about 3½ times that of the unaided ear. It is extremely light and portable, and can be rapidly transported to any place desired.

Here Is the "Paraboloid"—the Clever Sound Focusing and Detecting Device Used by the Allied Armies in Locating Enemy Aircraft While They Were Yet Several Miles Away. The Sound of the Airplane Engine Carried Far, and by Carefully Focusing the Collected Sounds and Concentrating Them onto a Sensitive Microphone, the Trick was Done.

Five-Foot Searchlight Added to Terror of Night Fighting.

The accompanying photograph illustrates one of the remarkably light, yet extremely powerful, electric searchlights developed for use in the war. Searchlights of this type were built by the thousand by all of the leading powers, and both sides used them for various purposes, including night battles, the discovery of hostile aircraft, trailing the movements of enemy troops and freight trains, and automobile freight lines.



The searchlight here shown requires about 15 K. W. or 20 H. P. to light it to full brilliancy, and its powerful light will carry from 10 to 15 miles easily. The searchlights that we are usually accustomed to seeing on vessels and in the neighborhood of forts are usually cumbersome affairs, but the exigencies of wartime, where such vast amounts of paraphernalia had to be hauled over by train, horse, or auto-truck, called for the very lightest weight in all such apparatus as these, where there was no real necessity for making such an apparatus of great weight, as is the case with many pieces of machinery, such as guns, dynamos, motors, gasoline engines, et cetera. The searchlight is mounted on light wheels, similar to small auto wheels, fitted with rubber tires. It can be hauled to any desired spot in a short time.

During the period of the war, many novel and startling inventions have come to the fore, especially means for locating hostile airplanes and dirigibles. The majority of these operate on the simple sound wave principle, the waves being transmitted thru the medium of the air from the propellers of the hostile aircraft. Some of these devices have been made in the form of large tubes, provided with a simple microphone method of detection, but they were rather unwieldy, and to a certain extent never gave full satisfaction, due to the fact that too great a dependence was placed on the amplifying of the hum of the airplane engine by means of microphones alone. This new form of locater—the Paraboloid—has several novel improvements over previous apparatus of this type, one of the best features being that it can readily detect the hostile aircraft at great distances, especially valuable when the enemy tries to make a surprise attack at night.

Spotting the Enemy.

Imagine a peaceful village, such as are numerous in the sparsely settled sections on the coast of England, seemingly defenseless. Yet there seems to be an air of mystery about some of these places—and there is, for thru underhand means, the enemy "spies" learn that secret research work is being carried on in this unassuming little hamlet. It would be suicide upon the part of these "spies" to personally attempt to carry out any large exploitation or even to think of attempting to blow up the place with any hope of success. The nearest recourse that they could have would be to get in touch with a squadron of enemy planes, and notify them where these operations are taking place. On a dark night, these enemy planes issue forth and swoop down, like a nest of hornets, upon this defenseless little village. But one thing they have overlooked. Altho they have come unheralded, it is true, the watchful *electrical eyes and ears* of the engineer corps are prepared for any such surprise, thanks to the fact that they have this marvelous invention on hand, whereby it is possible, no matter how dark the night, to quickly and positively locate the approach of enemy aircraft. To their sensitive ears comes the hum of the engines. Word is flashed to every little town, fort and hamlet within the vicinity, and especially planned advance action is arranged. Ere the fliers have reached their destination, the heavens are being explored by gigantic searchlights for the enemy marauders. Trained gunners, using the very latest types of anti-aircraft guns, are soon popping away at the enemy, and what was hoped to be a great surprise and success on the part of the enemy, turns out to be one grand fizzle, much to his discomfiture.

These powerful searchlights, besides being available for enemy spotting, are also much used as a means of signaling. This is one branch of the signal corps work which has proven one of the big factors in helping to win the war. Searchlights of this type mounted on warships helped to protect the American sea coasts.

Photos by Press Illustrating Service

Gigantic Electric Searchlights of the Portable Type Were Used to Expose the Enemy Flier as Soon as the "Paraboloid" Had Succeeded in Spotting Him. The Anti-Aircraft Guns Then "Saluted" Him—and the Allied Planes Finished the Rest.

Jeweled Portal Welcomes N. Y. Fighters

NEW YORKERS, who openly boast "there is nothing new under the sun," had an agreeable surprise in the "jeweled portal" of electric lights erected in Fifth Avenue at Sixtieth Street, on the occasion of the grand review of the Twenty-seventh Division returning warriors. It was designed and erected under the direction of Walter D'A. Ryan, lighting expert.

So magnificent was the illuminated arch that it drew forth the unstinted praise and commendation of everyone who saw it. Frank L. Dowling, President of the Borough of Manhattan, when he first saw the beautiful spectacle, exclaimed: "Like the entrance to Heaven!" And no better description could be given of this handsome testimonial to the bravery, sacrifices and triumph of the sons of the Empire state. The details of the "portal" were worked out by Captain J. W. Gosling, under the direction of Mr. Ryan, who was chief of the department of illumination of the Panama-Pacific International Exposition which took place in San Francisco in 1915, and the success of which became one of the wonders of the world.

Mr. Ryan carried the same style of decoration here as was used at the Panama-Pacific Exposition. The same jewels, to the number of 31,000, were used in this jeweled portal as were used at the Panama exposition. This is really the first time the people of New York had an opportunity to see something that was really new, and it was the second time these jewels were used, the same ones that hung on the tower at San Francisco for one year.

The "Jeweled Portal" is really a gigantic curtain of jewels draped between two obelisk forms, and spans the street at a height of twenty-five feet at its lowest point, and fifty feet at its highest.

The architecture is simple, bold Roman, and is the kind of thing which might have been built on a street in Rome on the return of their victorious legions, but instead of painted and embroidered banners the modern jewels have been substituted and the whole portal has been given a most modern touch by bringing out upon it the delicate flashings of thousands of points of true light, not the color of pigment but the pure colors of the spectrum, the colors only seen in the rainbow, a bubble or in the sky at dawn or sunset, by illuminating it with arc projectors.

The obelisks stand at either side of the roadway and arc flanked by Roman altars, each of which is twenty-six feet high. The jeweled curtain is draped from altar to obelisk across the avenue and down to the

Reviving Plants With Electricity

The accompanying illustration shows a clever scheme devised by a Connecticut flower grower for reviving almost lifeless plants, by the application of low-voltage direct current, such as that supplied from a dry or other battery. One of the experiments was tried on a small cactus plant which had been sent from Mexico, and which seemed to pine away rapidly. The cactus was about dead when the experiment of applying electric current was first tried. Two cells of dry battery were connected up with some fine copper wire, the positive pole being connected to a nail placed in the soil of the flower pot, while the negative pole was secured delicately around the upper branch. The cactus brightened up very sprightly after one week of this treatment, and in two weeks it was plump, green, and growing nicely. Further experiments were tried on a rose bush and a fuchsia with good results, care being taken to see that the positive wire from the battery is applied to the root of the plant and the negative pole to the foliage, so as to promote the flow of sap upward.

Reviving Weak or Stunted Plants with the Small Current from a Few Cells of Battery Is the Latest in Science. Anyone Can Do It. The Apparatus Is Simple, and the Only Thing Necessary to Watch Closely Is That the Polarity Is Correct. The Positive Pole of the Battery Is Always to Be Connected to the Root of the Plant and the Negative to the Foliage.

It may be thought at first that the battery would soon be exhausted, but the resistance of the plant is of considerable value, so that the flow of current is but a small fraction of the ampere, and the cells will thus give quite a lengthy treatment before being entirely exhausted. Those having access to a storage battery will find it very useful for the purpose. The current in this case should be regulated by means of a small rheostat, such as the rotary, porcelain base 10-ohm rheostats available on the market. Several other interesting experiments were tried by the Connecticut florist, notably on a small plum tree, which was electrically treated with 6 cells, with the result that it blossomed out fully, several days ahead of the other adjacent trees. Another experiment was that conducted on an ever-bearing strawberry plant, which was treated with 2 dry cells. This plant was left in the same row with other berry plants, and its increased size and fruit production was very striking.

By ISABEL M. LEWIS
Of the U. S. Naval Observatory

The Nature of Comets

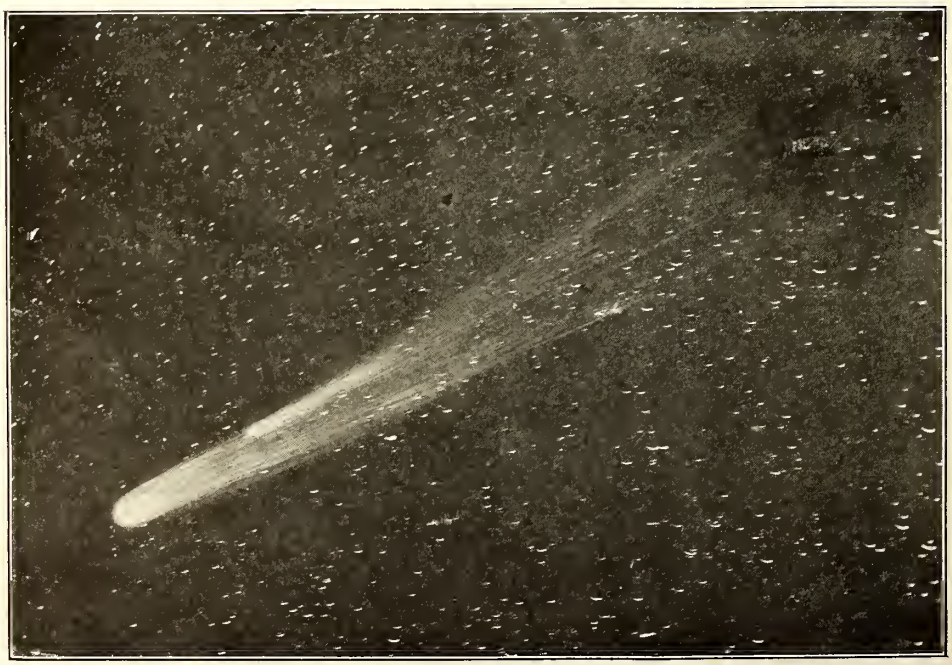
COMETS, along with shooting stars and meteors, are to be clast as part of the debris of the solar system. According to prevailing theories they may have been originally tenuous outer portions of the primitive solar nebula that escaped being swept up by the nuclei of the planets and their moons owing to the fact that they did not share in the general rotation of the system, or they may, possibly, have been the lighter gases ejected from one or the other of two closely approaching suns that furnished, by the disintegration resulting from their close approach, the material wherefrom our present solar system was formed.

The orbits of comets are inclined at all angles to each other and to the orbits of the planets which, on the other hand, lie very nearly in the same plane.

The larger members of the sun's family, the planets and their satelites, revolve from *west* to *east* around the sun. Comets on the contrary frequently *retrograde* or back around the sun in the opposite direction, from east to west.

The paths that these erratic visitors follow in their journeys around the sun bear not the slightest resemblance to the paths of the planets, which are almost perfect circles. The cometary orbits are ellipses of such high eccentricity that it is customary in computing a preliminary orbit of a comet to assume that its eccentricity is unity, *i.e.*, that it is travelling in a parabola. If the eccentricity is less than unity the orbit is a closed curve or ellipse, and if it is greater than unity the orbit is an hyperbola. In the latter case the comet would make one and only one visit to the sun, coming from interstellar space and returning thereto after a brief sojourn within our solar system. Since no cometary orbit has ever been found to be hyperbolic in form it has been assumed that the eccentricity of the orbit is less than unity in all cases and that the comets are all travelling in elliptical orbits and therefore are permanent members of the solar system. The nearer the eccentricity of the orbit of a comet approaches to unity the greater is the path described and the less frequent the comets return to the sun. Since it is very unlikely that the eccentricity of an orbit is exactly unity there are probably no comets that have parabolic orbits tho, for the preliminary computation of the orbit of a newly discovered comet the unknown eccentricity is assumed to be unity. This is generally a safe assumption for the majority of all comets travel in ellipses whose eccentricities approach closely to unity and their periods of revolution around the sun consequently run into the hundreds or thousands or even hundreds of thousands of years. A wonderful study, indeed.

Giacobini's Comet, December 29, 1915, Photographed with 10" Bruce Telescope, Yerkes Observatory, by E. E. Barnard. Note the Unique Sharply Defined Tail With Convex Edges. The White Dashes Are Stars Leaving a White Trail on the Photographic Plate as the Telescope Followed the Comet During Its Exposure of Several Hours.



Donati's comet of 1858, one of the greatest comets of the nineteenth century, had a period of more than two thousand years and its aphelion (the point in its orbit farthest away from the sun) was five times more distant than the orbit of Neptune.

There is, however, a class of comets known as *periodic* comets that are characterized by extremely short periods of revolution around the sun. To this class belongs Halley's comet whose period of seventy-five years exceeds that of any other periodic comet. Encke's comet, on the other hand, has a period of three and a third years which is the shortest cometary period known. Most of the periodic comets are inconspicuous and only visible telescopically even when comparatively near to the earth. Halley's comet is the only one of this class that lays any pretensions to remarkable size or brilliancy and it also is showing the effects of disintegration resulting from too frequent visits to the sun.

Comets are bodies of *great bulk* or volume and *small total mass.* Their tails, which only develop in the vicinity of the sun, are formed of the rarest gases and the best vacuum that man can produce would not be in as tenuous a state as the material existing in the tails of comets. There are many proofs of the extreme tenuity of comets. The earth has on a number of occasions past directly thru the tails of comets without experiencing the slightest visible effects. Stars shine undimmed in lustre even thru the heads of comets. If the earth should encounter a comet "head on" it is doubtful if it would experience anything more serious than a shower of meteors which would be consumed by friction with the earth's atmosphere. It is possible, however, that matter in the nucleus, the star-like condensation in the head of a comet, may consist of individual particles weighing in some instances a number of tons surrounded by a gaseous envelope and held together by the loose bonds of their mutual attraction.

Since the total mass of a comet is so small a close approach to one of the planets, especially Jupiter, produces great changes in the form of the comet's orbit tho the motion of the planet is not disturbed in the slightest degree by the encounter.

The majority of all the periodic comets have been "captured" by Jupiter, that is, the original orbits have been so changed by the perturbations produced by close approaches to the giant planet that their aphelia lie in the vicinity of Jupiter's orbit. Several of the other planets have also "captured" comets in this sense, and the fact that the aphelia of a number of comets are grouped at certain definite intervals beyond the orbit of Neptune has been considered by some astronomers to be an indication that there are two or more additional planets in the solar system revolving around the sun at these distances.

Halley's Comet, June 6, 1910, Photographed at the Yerkes Observatory by E. E. Barnard, Taken With 10" Bruce Telescope, Exposure Two Hours. The Most Remarkable Part About This Comet Is That It Disintegrated. Photograph Shows Upper Part Leaving Main Section

The most interesting feature of a comet is its characteristic tail which develops and increases in size and brilliancy as the comet approaches the sun. As the tail is always turned away from the sun it follows the comet as it draws near the sun and precedes as it departs. Its origin is due, it is believed, both to electrical repulsion and *light pressure* acting upon minute particles of matter in the coma or head of the comet.

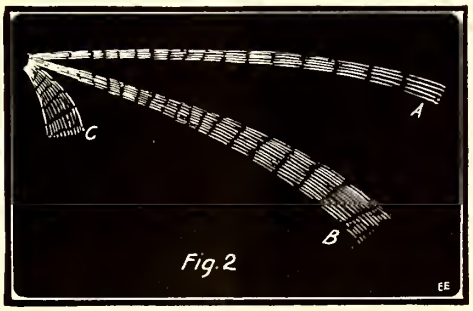
It is believed that the curvature of the tail depends upon

www.americanradiohistory.com

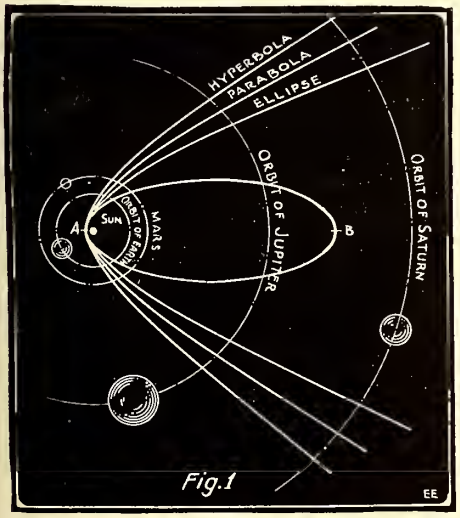
the nature of the gases of which it is composed.

Long, straight tails consist chiefly of hydrogen, it has been found, curved tails of hydrocarbons and short, bushy tails of mixtures of iron, sodium and other metallic vapors. At times the same comet will have two or more tails of different types.

Since the material driven off from the nucleus or head of a comet by electrical repulsion and light pressure is never recovered, it is evident that comets are continually disintegrating. Also, comets that have past close to the sun at perihelion passage have frequently been so disrupted by tidal forces that one nucleus has separated into several parts and the newly formed nuclei have pursued paths parallel to the original orbit, each nucleus developing a tail of its own.



Daniel's Comet, August 6, 1907, Photograph Yerkes Observatory by E. E. Barnard. This Photograph Shows the Full Length of Tail About 12°, Taken With 3" Lens.



Many periodic comets, it is now known, have gradually been broken up and dissipated into periodic swarms of meteors as a result of the disruptive effect produced by too frequent returns to the vicinity of the sun.

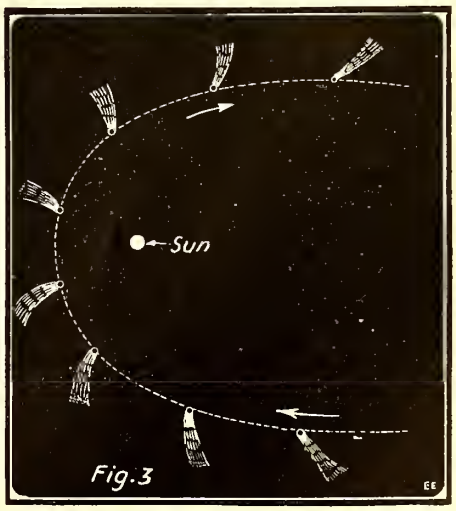
The luminosity of comets is due not only to reflected sunlight, but to certain unknown causes that produce sudden and erratic increases or decreases of brilliancy. The causes of these sudden changes in luminosity are unknown, possibly electrical discharges or chance collisions between fragments of considerable size may account for some of these sudden flashes of brilliancy.

The peculiar behavior of the tails of comets at certain times has frequently been noted and suggests the existence of quantities of finely-divided meteoric or gaseous matter within the solar system that have no appreciable effect upon the huge planetary masses, but offer sensible resistance to the passage of the tenuous gases of which the tails of comets are composed. The fact that the earth daily encounters meteoric dust, meteorites and fire balls also indicates that meteoric matter exists in considerable quantities within our solar system. Tails of comets appear at times to be twisted or brushed aside as if they had encountered some unknown force or some resisting medium.

Different Types of Tails of Comets. A—Hydrogen; B—Hydrocarbon Gas; C—Iron and Other Metallic Vapors. The Majority of the Tails of Comets Belong to Type B and Are Therefore Chiefly Composed of Hydrocarbons.

This Diagram Shows a Typical Cometary Orbit of Short Period. A Marks the Perihellon, or Closest Approach to the Sun, and B the Aphelion, or Point Most Distant From the Sun. The Great Difficulty of Determining Whether a Comet of Long Period Is Moving in an Ellipse, Parabola or Hyperbola Is Evident When One Considers How Closely the Three Curves Coincide in the Vicinity of the Sun.

Up to the present time several hundred comets have been discovered. Nearly three-fourths of this number travel in orbits that are sensibly parabolic with eccentricities approaching closely to unity. Of the remaining number there are about forty that have been "captured" by the major planets, Jupiter, Saturn, Uranus and Neptune, tho Jupiter possesses the lion's share of these captured comets. Scarcely a year passes by that several comets are not discovered. Most of these are telescopic, however, even when they are near the sun and at their greatest brilliancy. Naked-eye comets of great splendor and brilliancy are comparatively rare and there has been a particular dearth of such unusual comets during the past thirty years or so.



The last spectacular comet, unless we make an exception of Halley's comet, which made its return according to prediction in 1910, was the great comet of 1882 which was visible in broad daylight close to the sun and at its perihelion passage swept thru the solar corona with a velocity that exceeded two hundred and fifty miles a second and carried it thru one hundred and eighty degrees of its orbit in less than three hours.

Some comets approach much closer to the sun than others. The majority of all comets observed have come within the earth's orbit and no known comet has its perihelion distance beyond the orbit of Jupiter. It is, of course, possible that there may be a number of comets that never come within the orbit of Jupiter, but it is very unlikely that any such comet would ever be discovered. The majority of comets are simply small, fuzzy points of light that are only visible telescopically and the greater the perihelion distance of the comet the less likely is it to be seen with the naked eye.

Since comets as well as planets obey Kepler's first law, known as the law of areas, and sweep over equal areas in equal times it is evident that when a comet is at perihelion or nearest to the sun it is moving at maximum speed and when it is at aphelion or farthest from the sun it is moving at minimum speed. Moreover, its speed at these two points in its orbit varies tremendously since the orbits of comets are ellipses of very high eccentricity. The speed with which the planets are travelling is, on the other hand, remarkably uniform since their orbits are nearly circular.

The leisurely speed with which a comet travels thru the frigid outer regions of the solar system is gradually accelerated as the comet draws nearer and nearer to the sun until it has acquired near the time of perihelion passage a velocity that occasionally exceeds two hundred miles a second. Here, also, the great increase in light and heat and the strong magnetic field of the sun produce complex changes in the gaseous and meteoric substances of which the comet is composed until the character-

Steinmetz's Own Shorthand

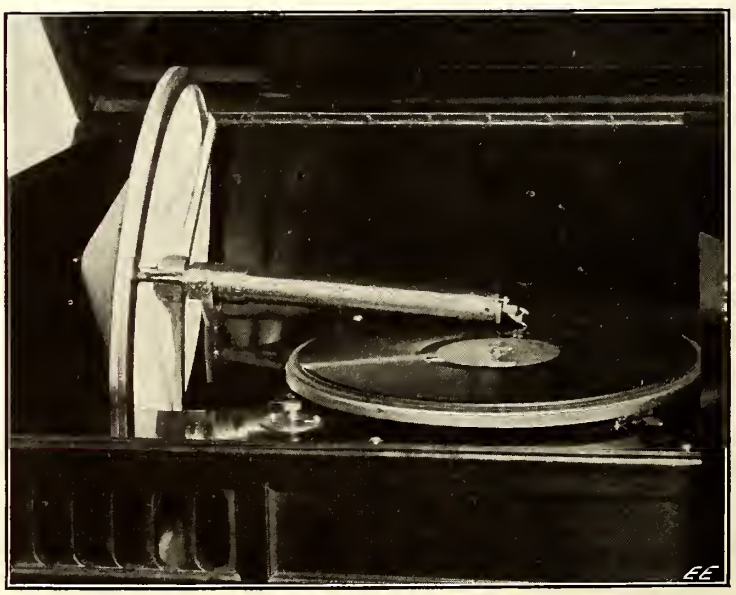
A Recent and Little Known Picture of Dr. Charles Proteus Steinmetz, Consulting Engineer to the Great General Electric Company, Taken in His Study. The "Electrical Wizard" Uses a Special Shorthand of His Own, by Which Means He Can Write His Notes as Fast as He Can Think—and That's Some Speed, We'll Say. The "Code" to His Shorthand Is Here Given As Written by Himself.

Can you write as fast as you can think? If you cannot, then your efficiency is impaired; and the difficulty of putting down your thoughts at the proper speed constitutes a real stumbling block in your onward march toward your goal.

Dr. Steinmetz, one of the greatest authorities on matters electrical that the world has known, and who is an author of many volumes of useful knowledge which he has given to the scientific world, possesses no "neck in the bottle" when it comes to jotting down the results of his researches in his wonderful laboratory at Schenectady. In a recent interview upon this subject he said:

"With this shorthand I can write as fast as I can think. The only other way in which I could put down my thoughts as fast as I could think would be to dictate to a phonograph, but I have not always a phonograph with me.

"I learned this shorthand while I was in high school in Europe, and took all of my notes while in college in shorthand. All of these notes I have preserved and had bound, and I can read them as well after thirty-five years as I could thirty-five minutes after taking the notes down.



(*Continued on page 373*)

A Hornless Phonograph

This talking machine eliminates the usual tone-arm, sound-box, and horn. Instead of these we have a large cone-shaped diafram of parchment fitted into a large circular aluminum frame. The center of the diafram is connected by a wire, under tension, with the needle holder. The sound as it comes from the record sets up vibration in the wire, and the vibrations are released in the form of recognizable sound directly from the diafram. The volume of sound is controlled by a special attachment on the arm protecting the wire, for those who desire this method, but is more readily controlled by the opening and closing of the doors of the cabinet. There are two doors in front, each of which may be closed separately, and a large door on the side which also gives control to the tonal volume.

The circular frame holding the diafram is constructed of aluminum, heavily gold plated, as is the tube thru which the wire runs from the needle to the diafram as well as the other metal parts of the attachments. The simple twist of the needle holder permits the playing of either hill and dale or lateral cut records on the same machine, and it therefore makes the new reproducer practically universal in its application. It is claimed for the Pathé "Actuell" that, inasmuch as the sound comes in its full volume direct from the reproducer to the ear, it does not suffer from the overtones or conflicting vibrations that sometimes devlop when the sound is carried thru an amplifying chamber and likewise by reducing the number of factors incident to tone reproduction.

Thru the use of this large diafram surface, noise, if not entirely eliminated, is reduced to a point where it is not audible.

The Newest in Talking Machines—No Horn, Just a Large Vibrating Diafram That Radiates the Sound in All Directions Equally.

Experiments in Physics

By JOHN J. FURIA
DEPARTMENT OF PHYSICS, N. Y. UNIVERSITY

1--Perpetual Motion

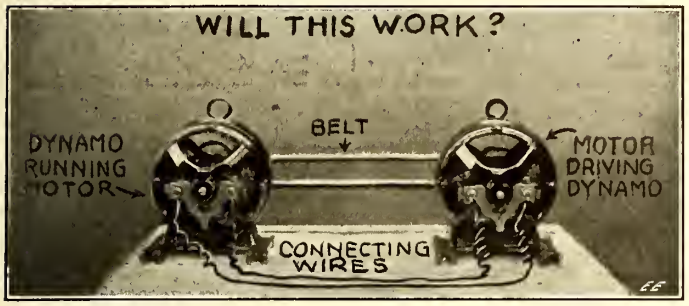

Fig. 5. The Electrical Student's Dream: Belt a Dynamo and a Motor Together. Connect Their Windings Electrically and—Presto! You Have Perpetual Motion! But Do You? Read On, Macbeth, Read On!!

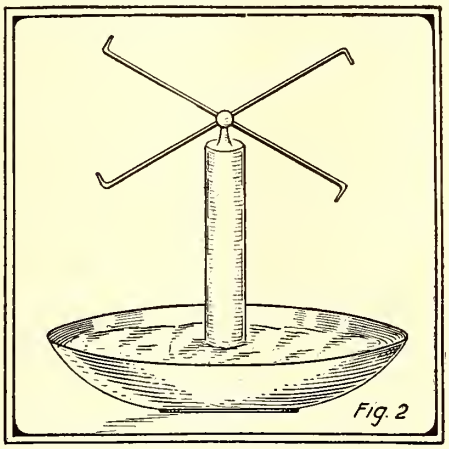
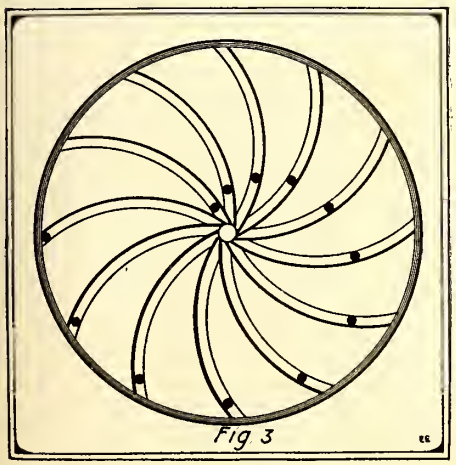


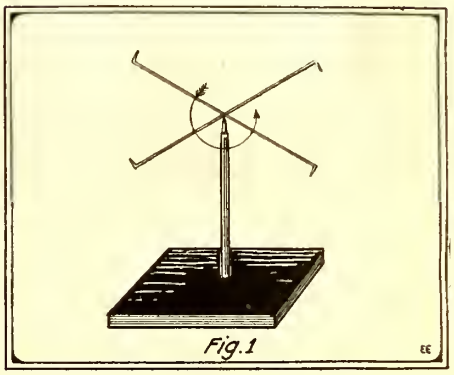
IT is a well known fact that more Time, Energy and Money have been spent and wasted in searches for a machine capable of producing *Perpetual Motion* than for all other scientific pursuits combined. The impossibility of perpetual motion can be demonstrated by the simple elementary laws of Mathematics and Mechanics, and consequently the *truly* scientific mind wastes no time in such a search. Perpetual motion is a direct violation of that fundamental law of Physics, the law of *conservation of energy;* hence in order not to waste time in argument with a perpetual motion inventor, to show him the fallacy in his reasoning (?) one has but to say "it contradicts the law of conservation of energy." The U. S. Patent Office has a sure-fire means of disposing of these would-be inventors—it asks them to produce a working model! That settles it, for if the inventor cannot make the proposed scheme work, who can?

Perpetual motion and perpetual motion machines are defined in many ways, all the definitions conveying the idea of *getting something for nothing, indefinitely.* The getting something for nothing idea, of course, will appeal to the general public ignorant of science, and the natural consequence is "swindling schemes." One definition is—a perpetual motion machine is one which will go on moving without assistance from any external force, except possibly gravity, until the parts of which it is made wear out! The inventor usually adds that his machine will evolve more power than is required to run it. The efficiency of such a machine would therefore be *greater than* 100 *per cent.!* Perpetual motion machines fall naturally into two classes—the *absurd class* and the *frauds.* The second of these classes hold no interest for us scientifically. In general a perpetual motion machine would be invented (the inventor being backed up by publicity specialists). A glowing account of the operation of the machine before a distinguished audience from "Podunk" would appear, together with front page photographs of the machine and of the handsome and distinguished looking inventor—who always spent a life-time and several fortunes in perfecting the ninth wonder. The inventor having spent all his money and all he could borrow would therefore be willing to *sacrifice* a major share in his invention for a few thousand dollars, and some fortunate young heir or widow would perchance acquire an expensive education. Nowadays, if an account of a perpetual motion machine should appear in the papers, some secret service men would keep in touch with the "benefactor to mankind" and in a short time, or as soon as his "gilt edge stock" began to sell, said benefactor would shortly rest behind prison bars.



The first class of machines is of considerable interest. Most of us have at some time or other spent much time in thinking up perpetual motion machines and still more time in trying to fathom the reason why our schemes *would not work.* Which one of us has not at some time or other hooked up a small toy dynamo and motor with the intention of causing the dynamo to supply current to run the motor and some lights, bells, trains, etc.—while the motor in turn, belted to the dynamo, drives the latter machine. See Fig. 5. What a great disappointment it was to find that the scheme wouldn't work. To be sure, on connecting the hand drive to the dynamo, we get enough "juice" from it to run our motor and our lights and other things. Also we can run our motor from some cells and by belting cause the dynamo to run. Why then does our perpetual motion machine fail us? The answer is simple—the *law of conservation of energy.* Let us assume that our motor and dynamo were identically made and practically frictionless. The machines of Fig. 5 are of this type. A current of 1/10 ampere is used by each when acting as a motor, at a potential of 10 volts; therefore, 1 watt of power is consumed. Since the efficiency would have to be less than 100 per cent., due to friction and eddy current losses, etc., then when acting as a dynamo *less* than one watt power is given off. Hence one of the machines *can never be made to run the other, let alone do other work besides!*

Another electrical type of perpetual motion machine familiar to most of us depends for its operation (or rather for its failure to operate) on the action of points.



(*Continued on page* 377)

It Should Go on Forever, They Say—This Hydrostatic Marvel. The Atmospheric Pressure of 15 lbs. per sq. Inch on the Water in Bowl Forces It UP Thru the Revolving Arms. The Water Shoots from the Nozzles Back Into the Bowl—Ad Nauseam.

$50.00 Prize Contest

Uses for Old Phonograph Records

NOT so long ago we ran a "Burnt-out Lamp Contest" giving prizes for the best ideas what to do with the old burnt-out lamp globes. Thousands of suggestions were received from every part of the world, and we all had a lot of fun. We publisht the best ideas and we know that many of them are now actually being used daily.

Your average experimenter is happy only when he can take a lot of antiquated old "junk" and put it to a new use——he'd take an Egyptian mummy and convert it into a rotary spark plug, if it were possible!

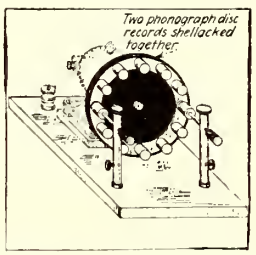
Want a Small Belt Pulley? Procure a Few Old Phonograph Records, Shellac Them, Place in a Vise Until Set, and You Have a Fine Pulley.

So the other evening when we stumbled over a lot of old phonograph records that had been played so long that they would "phono" no longer, we said—Ah, what can we do with them? Too good to throw away! So we thunk awhile and ended by making a fine Wimshurst static machine, using two plates to generate the juice. Of course that's old stuff, every "bug" knows that trick.

But we felt we had stumbled into a veritable gold mine. Now we admit that our editorial think-tank becomes clogged up once in a while, so we thought we'd put it up to EXPERIMENTER readers—they have us beat forty different ways as a rule. True, in our younger days ye Editor once made a very serviceable pulley by shellacking eight, old, cracked 7" disks together which made a pulley about one inch thick, and which did gallant work. True, that he also once made a rotary variable condenser from a dozen 10 cent records (tin foil shellacked to one side of the records). True, also, that he once constructed an emergency rotary spark gap using two 7" records shellacked together with zinc plugs screwed to the face of the records——but really all such stunts are commonplace.

Of course you can do much better than this. Somewhere there is a "bug" who will turn in a really good idea. And we're out to find that "bug." Yes it will cost us $25.00 for that prize idea, but we think it will be cheap at that.

Now, then, boys, let's see how much ingenuity there is around. I promise you lots of fun and your fellow-bugs will bless you for generations, because your ideas will be of tremendous value to them.



Now listen!

$50.00 IN PRIZES

1st Prize
$25.00 in Gold

2nd Prize
$15.00 in Gold

3rd Prize
$10.00 in Gold

Rotary Spark Gaps Are Quickly Made From Old Phonograph Record Discs.

OLD PHONOGRAPH RECORD CONTEST.

This contest is open to every reader whether subscriber or not.

These prizes will be paid by the publishers of the ELECTRICAL EXPERIMENTER for the best useful ideas what to do with old phonograph records.

The two important conditions are that the idea must be a useful and original one. It is not necessary that the record or records be used with electrical devices, *any* use is satisfactory as long as the resulting device is useful and, of course, therefore practical.

Any amount of records, and any and all sizes can be used. Records can be sand-papered, turned down, bent in hot water, etc., it matters not, as long as they are actually used. The final shape does not matter.

Two Old Phonograph Records Make a Good Static Machine, When Drest Up a Little With Some Tinfoil Sectors, and Then Rotated In Opposite Directions.

We shall try and award the prizes to those *who actually have built or made the device which they describe.* Therefore those contestants sending actual photographs of the ideas stand a better chance to win a prize.

Description is limited to 200 words. Use one side of paper only. Use ink or typewriter. No pencilled matter considered. Sketches must be on separate sheets of paper.

Contest closes in New York, September 15th. Prize winners will be announced in our November issue.

Address all letters, photographs, etc., to: Editor: "Old Phonograph Record Contest."

Airplane Parachute a Success

Lieutenant Jean Ors, of the French Army, demonstrated the usefulness of his "aërial life preserver" recently at Atlantic City. This device is an adaptation of the parachute to airplane use, and toward the end of the war was widely employed by the Allied armies, greatly reducing the mortality when machines were shot or caught fire. The test of the device was before a committee of American and foreign experts, and after Lieutenant Ors had proved the worth of the life preserver, he received a special prize of $500.

The aërial device, contained in an oil-cloth packet, is only fifty inches in diameter and four inches thick. It weighs about fourteen pounds. For the test it was affixt to the underbody of the airplane with a rope running into the cowl, so that the lieutenant could make the release at the proper moment. When it was in place "Eddie" Stinson, America's leading fancy flier, tuned up his craft and he and the Frenchman hopped in.

Stinson and his passenger rose well above 1,000 feet, and swinging in a giant circle made two trips around the airport. Then, dipping down to about 500 feet, Stinson ran his machine southeast, directly into the wind, so that the parachutist could gage his distance. As Stinson shot in a 200-yard spurt at eighty-mile speed, the watchers saw the lieutenant crawl cautiously over the cowl of the machine, poise there a second, and raise an arm as he ript the fastenings of the parachute, and then plunged earthward from the streaking airplane.

For the fraction of a second he was enveloped in the smoke of the exhaust. Then he came hurtling at the field. Quick as a flash the life preserver opened, the fall of the Frenchman being checked without perceptible shock *within fifty feet after he made the jump.* Slowly the wide-spreading white silk umbrella, with the army officer dangling at the end of the ropes, swung to earth, the landing being as gentle as the arrival of a raindrop. The descent was made in forty-six seconds.

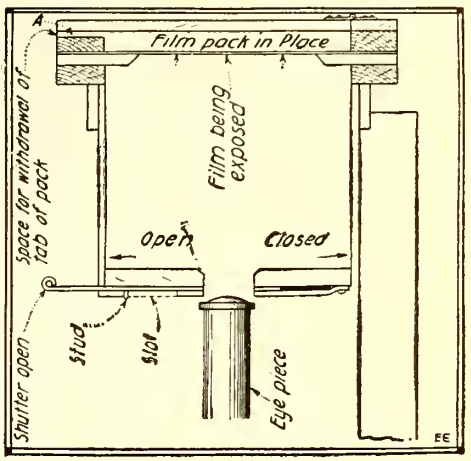
THE CONSTRUCTOR

How to Make Photo-Micrographs

By G. D. LAUDERMILK

BIOLOGY being one of the subjects in which I became interested, and having fitted up a small laboratory, I found that I required a photographic attachment which could be used in connection with a small microscope. So I finally evolved one made in the following manner:



The Apparatus Used in Making Photo-Micrographs, Comprising a Home-made Camera for Holding Plate Holder or Film Pack in Proximity to Microscope Eye-piece

The camera was made in two parts; "A," the plate holder, is a shallow box 6" long, 4" wide and 1" deep. The top of the box is hinged and the interior of the plate holder has a depression of a size to take a No. 320 Premo film-pack. It is modeled after the plate holder of a Premo camera. The camera box is 5" deep, 3" wide and 4⅜" from front to back. The camera has a strip ½" wide around it, ¼" from the top, forming a shoulder upon which the plate holder rests when in place; both the edges of the plate holder opening and the rim above the shoulder are covered with black velvet, forming a light-proof joint.

In the center of the opposite end is an opening ¾" in diameter closed by a simple sliding shutter made of sheet metal. Both the plate holder and the camera box are covered with imitation leather and are constructed of light wood. The hood "C" is of black cloth and serves merely to confine the draw-tube and prevent leakage of light between the eye-piece and the opening in "B." At the base of the upright is a wooden form exactly of the same shape as the foot of the microscope. This form is so placed that it acts as a guide to keep the microscope in position with the eye-piece.

When photographing, the slide is placed on the stage in the usual way and focust so that all details are brought out sharp. The microscope is then placed in position, the hood drawn around the eye-piece and fastened with a hook and eye. The shutter is now opened and the exposure made. The length of exposure will vary with the degree of transparency of the object and the depth of staining. Thin clear objects or objects stained with methyl-violet or blue

Faradic Currents--How to Apply Them

Sequel to "Building a Medical Coil Set."

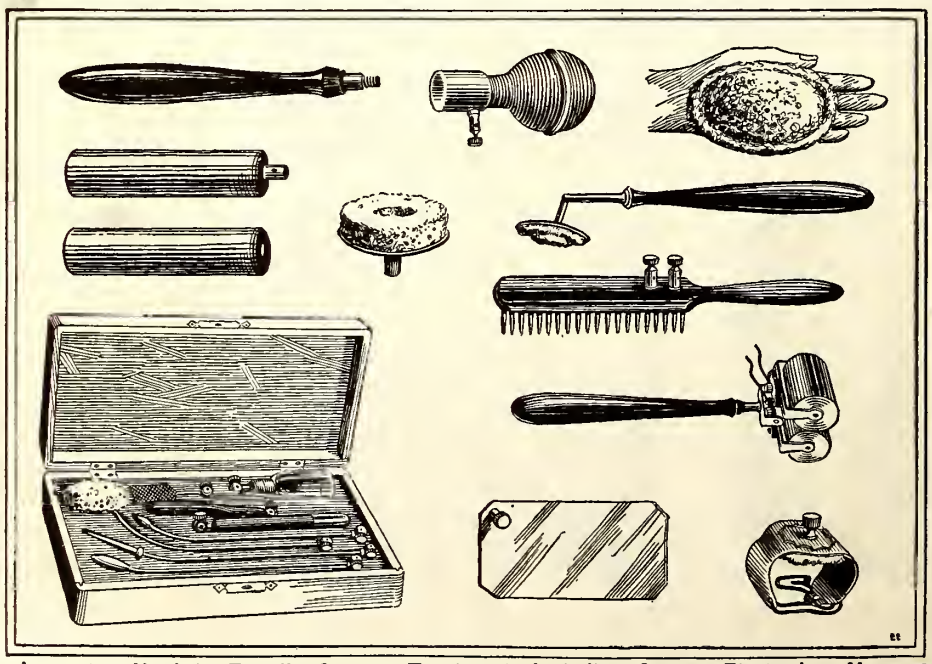
AN extensive article accompanied by working drawings and photographs appeared in the June issue of this journal, covering the construction of a high grade electro-medical or faradic coil. Methods were there explained for testing out the polarity of the coil, and thus it becomes easy for even the novice to properly apply the *positive* and *negative* electrodes as required in the following directions for the treatment of various ordinary ills, such as, headache, nervousness, rheumatism, etc.

The accompanying illustrations show how several people may join hands so as to form a *series* connection to the medical or shocking coil, and as many as eight or ten people—or more, may thus join hands in a circle, evolving a great deal of amusement at parties and social gatherings. One of the illustrations shows how a second person may apply the faradic current for facial or other massage with the hand. There are two ways of giving this massage, and one of the accompanying diagrams shows the second method, whereby the person applying the currents forms a *shunt* circuit to the patient. Where a mild current is desired, the shunt method is preferable, while the *series* connection gives a harsher or stronger current. For the purpose of giving massage treatments, there is available on the market special wrist electrodes, which have a binding-post terminal on them, to which one of the secondary wires from the apparatus may be connected. Many other forms of electrodes, including foot-plates, sponge electrodes, hair brushes, massage rollers, et cetera, are shown in one of the accompanying illustrations. The faradic secondary current produced by medical induction coils is, as explained in textbooks, in the form of an unsymmetrical alternating current.*

Where much of this work is being done, it is always best to invest in a sensitive milli-ampere meter which can be connected in series with one of the handle cords, so that the current strength in milli-amperes being administered, can be regulated. The proper current strengths for different ailments is given in any of the works on Electro-therapeutics, which may be consulted at almost every library.

Illustrating Several Interesting Applications of the Faradic Current. The Apparatus for Producing This Current Was Described In Complete Detail in the June Issue of This Journal.

General Considerations.



In treating diseases of an inflammatory nature and fevers the *positive* pole is generally utilized. This includes such ailments as swellings, bruises, sprains, extraneous growths and enlarged glands. In this treatment arrange the poles, if possible, *the positive above the negative:* while in debility, numbness, inaction, tendency to decomposition, treatment is given with the *negative* pole. The rule of the positive above the negative cannot always be followed in this treatment.

The primary current starts at the dry cell, passes thru one coil of wire (primary coil) thence thru the circuit-breaker thru the patient. The secondary is the *induced current* in the finer wire of the coil and is of much greater tension (voltage) than the primary, but not of so much volume (amperage). The *primary* current is used particularly in the treatment of scrofula ulcers, cancers, extraneous growths, enlarged tonsils, enlarged joints, granulated eyelids, enlarged glands, strictures, etc.*

The *secondary* current is applied in the cure of nervous and inflammatory diseases and acts as a tonic upon the system. There are two methods of applying electrical currents to the body viz: 1. General Electrization; 2. Localized Electrization.

By the first method the current is past thru the entire body or part of it. By the second method, the object is to influence special nerves, muscles or organs, limiting the action of currents to these parts, or, instead of trying to influence a muscle, we may stimulate the nerve supplying it, thus reaching the same indirectly. When the refreshing effects of the current are desired to relieve fatigue or ward off approaching paralysis some suitable exercise of the muscles should be combined with the galvanic current. Short sittings are better than long ones. In ordinary cases from two to

* For further details on the action of induction coils, including the wave form of the secondary or induced current, as well as the primary current, reference may be made to several works on induction coils including the following: "How To Make Induction Coils and Transformers," by H. W. Secor, and a later revised edition by J. S. Curtis, "Induction Coils in Theory and Practise," by Prof. F. E. Austin, "Induction Coils," by H. S. Norrie, "Induction Coils," by Armagnat, also several other works including those by A. Frederick Collins, Allsop, and Trevert.

Apparatus Used In Faradic Current Treatment, Including Sponge Electrodes, Massage Roller, Wrist Electrode, Foot Plate, Hair-brush, Bust Cupper, Et Cetera.

X-Ray Experiments

By Ivan Crawford

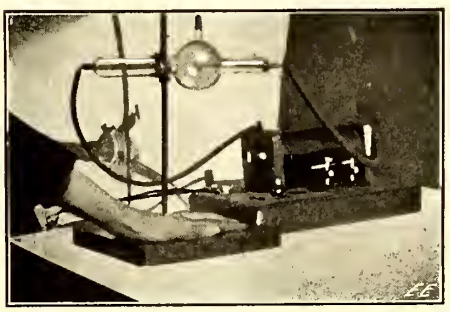
THE average electrical reader is not ignorant as to the general nature of X-rays, or more properly Röntgen rays, but he usually knows comparatively little about them. Considering the ever broadening field of usefulness of these remarkable rays, it behooves the experimenter who wishes to keep abreast of the times to make himself better acquainted with them and their properties. It is the author's intention in the following article to briefly outline the latest advances in this branch of science and to give some experiments, using apparatus within the reach of every experimenter.

Simple Form of Vacuum Bulb for the Production of X-Rays. When the Cathode Particles Strike the Target, B, They Set Up Etheric Vibrations—X-Rays—Radiating in the Direction Shown by the Dotted Lines.

Röntgen, while experimenting with a vacuum tube, noticed that the sides of the tube exposed to the discharge were brightly phosphorescent, and that if a screen of some phosphorescent substance such as potassium platinocyanid was brought into its vicinity it would become luminous. He also noticed that if a thick piece of metal were interposed a shadow was cast, while a piece of wood or a thin sheet of aluminum cast only a partial shadow, showing that the rays producing the phosphorescence could penetrate more or less easily objects opaque to ordinary light, but that the amount of penetration varied *inversely* as the density. This may be further illustrated by interposing the hand between the tube and the screen. The flesh being less dense than the bones cast only a light shadow while the latter are distinctly outlined. The rays were also found to possess the property of affecting a photographic plate.

Fig. 5. Sklagraph Taken by the Author, Showing Bones of the Hand and Finger-Ring. X-Ray Tube Excited on Two-inch Spark Coil.

Of course, an ordinary vacuum tube such as the one with which Röntgen first remarked the phenomena, does not produce X-rays in any great quantity. Many different forms of bulbs have been evolved but they may be divided into two general classes, namely, those operated on spark coils and those operated on high frequency currents such as those from a Tesla coil. As the spark coil exciter is more within the reach of the average experimenter, it has been selected for description in this article. Those who are interested, however, in the operation of high frequency X-ray tubes are referred to a most complete article on the subject by Dr. Frederick F. Strong, in the September, 1917, issue of this magazine.



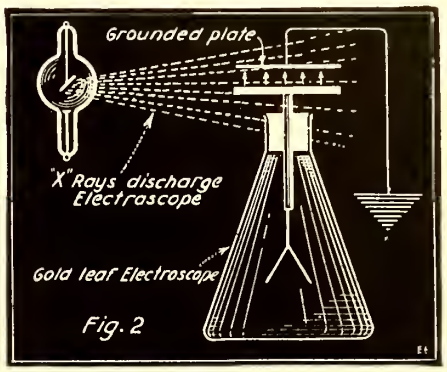


Fig. 4. How the X-Ray Tube, Hand to Be Radiographed, and Covered Photographic Plate Are Arranged.

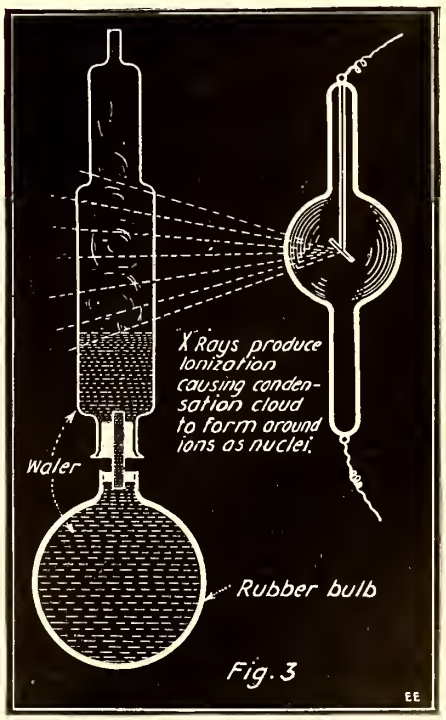

A simple tube for the production of Röntgen rays is shown in Fig. 1A. The cathode A is generally of aluminum and made in the form of a reflector. The anode B is faced with platinum or tungsten and inclined at an angle of 45 deg. to the cathode. Sometimes a third electrode (C, Fig. 1B) is added. This, however, is not necessary in small tubes. The pressure in the bulb must be extremely low. After extended use this tends to become even lower. This, altho producing more penetrating rays, decreases the supply of electrons, making it difficult for the discharge to pass. To remedy this some bulbs are equipt with a small platinum tube fused into the glass. When this is heated it allows the hydrogen to pass. If the bulb is not provided with any means of increasing the pressure it may be done by gently heating it in an oven. When the vacuum is high the bulb is said to be "hard"; as the pressure increases it is said to become "soft." For general work the bulb should be rather "hard."

The nature and properties of the rays will now be discust. When the cathode particles strike the target they set up etheric vibrations which radiate in the direction of the dotted lines in Fig. 1A. The nature of these vibrations has been the field of considerable discussion but has now been practically settled. It is the general belief that they consist of *extremely short ether waves*, similar in many ways to light. The chief points of difference lie in the facts that the objects which reflect or at least refract ordinary light are transparent to X-rays, neither are they subject to polarization. This evidence is, however, not so conclusive as it might seem at first sight. It has been known for some time that X-rays consist of vibrations about 10^{-9} cm. in length. It is impossible to conceive of a defraction grating of suitable spacing to intercept these waves. On the other hand, they have many similar characteristics. They move in straight lines, cast definite shadows, affect a photographic plate, and Brandes and Dorn have shown that they even produce a slight but sensible effect on the retina. Prof. Marx, by a series of complicated experiments showed that they traveled at the speed of light. His results, however, have not been generally accepted and his methods severely criticized. I have stated above that Röntgen rays are not subject to polari-

Heat Engines

By JOHN J. FURIA, M. A.

Dept. of Physics, New York University.

THE question often arises, "why is the *hot air* engine not used?" Air certainly is cheaper than gasoline. It takes less fuel to heat air than to convert water into steam. However, it does not follow that the hot air engine

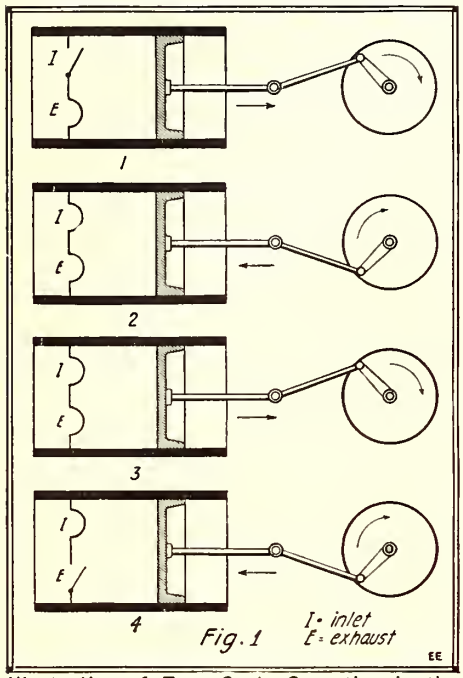

Illustration of Four Cycle Operation in the Gasoline Engine. First the Gas Mixture Is Drawn In. Second, Compression Takes Place. Third Comes the Explosion; and Fourth, the Expulsion of the Burnt Gases Takes Place.

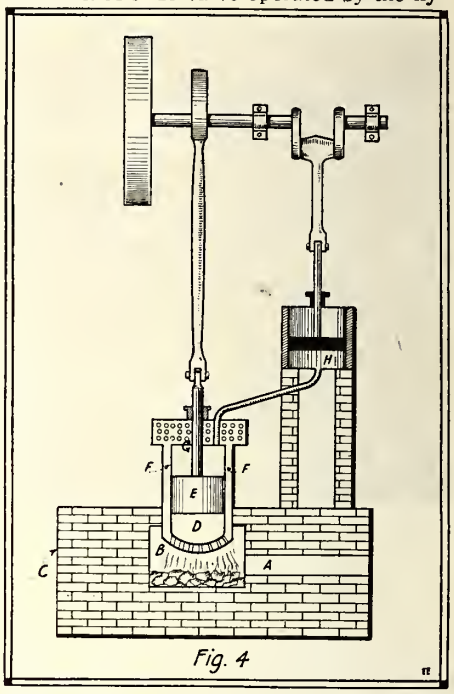
is the cheapest to run and at the same time obtain the necessary power. A little review of the gasoline and steam engines together with the principles of operation of the hot air engine will answer our question, why this type of engine is not used.

The Gasoline Engine.

The gasoline engine (internal combustion) has attained great popularity by its use in the automobile industry. It is flexible, capable of delivering a large amount of power, it develops high speed and power almost instantaneously. It also has an efficiency of about 25 per cent. The engine and the fuel used are light in weight compared with other kinds of engines of similar power. The four cycle engine is typical. Figure 1 is a sketch showing the conditions at each of the four cycles. The first cycle is started by turning over the flywheel (cranking the engine). This causes a *suction* in the cylinder. The inlet valve is either opened automatically or by the suction. The properly mixed fuel (gasoline and air) enters thru the inlet. (During this cycle the exhaust valve remains closed.) After passing dead center, the inertia of

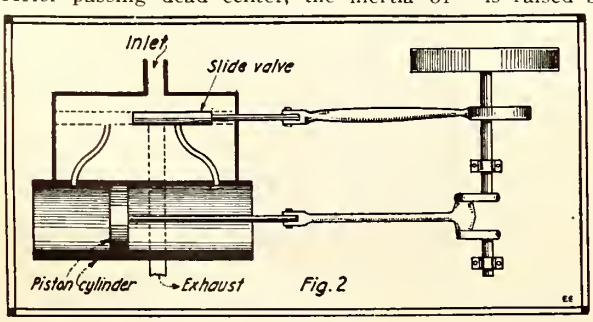


Gasoline—Steam—Hot Air

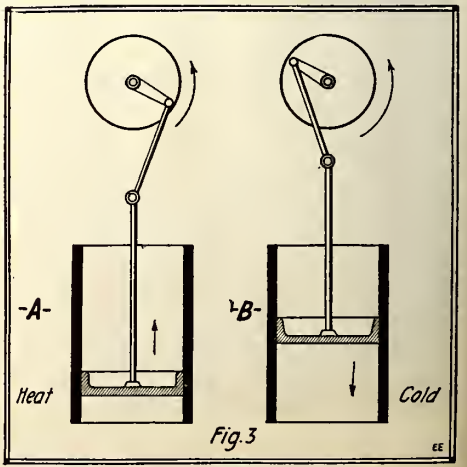
the moving fly-wheel causes the piston to move inward (cycle 2). The inlet and exhaust valves are both closed during this cycle, and the explosive mixture is comprest, rendering it capable of delivering greater power when it is exploded. As dead center is again reached, and the mixture is comprest to a maximum, the mixture is *ignited* by means of an electric spark properly timed. The mixture disintegrates as a result of combustion and forms a gas of tremendous pressure, this pressure causing the piston to move outward. This is the third cycle or power cycle. (Both valves are closed.) On again reaching dead center, the inertia of the fly-wheel causes the piston to move inward; the exhaust valve is automatically opened and the spent gases are expelled. (The inlet valve is, of course, closed during this cycle.) The four cycles are then repeated over and over again.

It is to be noted that during the whole four cycles, only one power stroke is secured; and that this power stroke is secured as a result of chemical action due to the combustion of the fuel mixture. The *four cycles* occur during *two revolutions* of the fly-wheel. It is therefore necessary to have a fly-wheel with a large moment of inertia in order to cause a steady running of the engine. Smoothness is obtained by using several cylinders instead of one, thus securing *more power strokes per revolution of the fly-wheel.* The high price of gasoline together with the complications arising in the devices for securing the proper mixture and the right kind of spark at the right time are points against the gasoline engine. Because of the high temperatures developed as a result of the chemical action, the cylinders must be cooled by some means, usually water circulation (another complication).

Steam Engines.



The steam engine is still very much used in spite of its low efficiency (usually ranging from 10 to 12 per cent). It possesses the disadvantage of not being capable of immediate starting; perhaps this is the chief reason for its not being used in automobile propulsion except in one or two special instances. Its bulk is, of necessity, very large comparatively as is the bulk of the fuel used. (A one horsepower engine requires about 2½ lbs. of coal per hour.) On the other hand it is simple in operation and control. Once steam is "gotten up," the movement of one throttle is all that is necessary to cause a change in speed and power. No fuel mixing device is used nor any electrical system. Figure 2 shows the main parts of a typical steam engine. Steam is raised by heating water contained in a boiler (any kind of fuel can be used). The steam is led into the cylinder thru the inlet valve. In the type illustrated below there are two inlets to the cylinder, one on each side. A slide valve operated by the fly-



The Stirling "Hot Air" Engine. It Only Consumes 2 lb. Coal per H.P. Hour, Being Therefore More Efficient Than the Steam Engine. These Engines Have Been Built to Develop Several Horsepower.

wheel moves in opposition to the piston, alternately admitting steam to the left and to the right of the piston, thus causing it to move back and forth. It is therefore apparent that there are *two power strokes for each revolution* of the fly-wheel or *four times as many as in the four cycle gasoline engine.* The spent steam is usually exhausted into the atmosphere. In the more modern steam engine the spent steam is condensed and brought back to the boiler, thereby requiring water to be added to the boiler much less frequently besides saving fuel. Because of the high price of gasoline, several automobile concerns have expended a great deal of time and money in research and development on automobile steam engines, and their "selling points" are extremely good ones. Getting up steam is reduced to a matter of only a few min-

Experimental Mechanics

By SAMUEL D. COHEN

LESSON XIII

REGARDING REAMERS.

IN the last lesson we completed the discussion on the subject of "Twist Drills." The reader is undoubtedly aware by this time that it is quite impossible to drill any size hole he desires with rigid accuracy thru the use of drills in commercial

Standard Form of Hand Reamer. The Reamer Is Used to Accurately Clean Out Drilled or Cast Holes, Especially Journal Boxes and Shaft Bearings of All Types.

practise. For example, it is desired to place a pin into a drilled hole to have a *driving* or a *sliding fit.* The reader will find that nine times out of ten he will be unable to obtain the proper size drill to do the work. In this instance another form of tool is at hand, namely, the *reamer.* This tool is used whenever a hole is to be enlarged just a few thousandths more than the original. Sometimes the reamer is used when a smooth hole is required, in which case the hole being first drilled is made *smaller,* in order to obtain the finally required size after reaming.

As in the case of twist drills, there are a large variety of reamers, varying in size, and each is suited for a definite purpose. Properly speaking, the reamer may be defined as a tool for perfecting holes previously drilled or bored. Fig. 1 shows a standard *hand reamer.* The reamer should never be used to remove any considerable quantity of stock, but merely to eliminate minute imperfections left by other tools. In some cases the hole may be made to within .001 inch before the reamer is applied, but generally the allowance of .002 inch to .010, according to the diameter of the hole, may be left for the standard reamer to cut. If given too much material to remove, the cutting edges of the reamer will wear too fast, and its reliability as a *sizer* will be quickly destroyed.

Reamers may be divided into two general classes: the *side-cutting* or *fluted* and the *end-cutting* or *bits.* Each of these classes are subdivided into *solid* and *adjustable* reamers.

The first well-known reamer is called the *solid fluted* reamer, and is made with slight modifications to suit two different cases, namely, hand and machine use. Fig. 2 illustrates a hand reamer which belongs to the *short set.* Reamers of the same general design are also made longer in regular sets. The cutting edges of fluted reamers taper in diameter for about one-fourth their length, from E to D being about .01 inch smaller at E than at D.

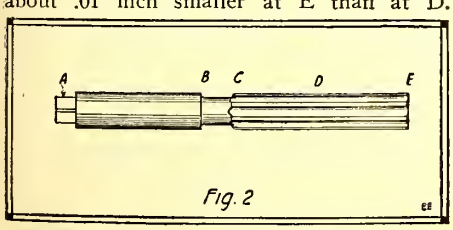

Illustration Showing a Hand Reamer of the Solid Fluted Type for Hand Use. The Letters Refer to Different Tapered Sections Described in the Text.

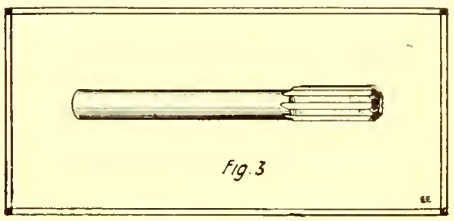
From D to C the taper is reversed, the diameter decreasing about .0002 inch per inch of length towards C. The part between A and B is usually made about .001 inch smaller than the largest diameter at D. When the cutting edges are worn to such an extent that the blank part, when free from bruises, will not pass thru the reamed hole, the reamer is too small for standard use.

As will be seen, the hand reamer has a square end, upon which a wrench is used to turn it. This is the main distinguishing feature between the above mentioned and the machine reamer of the fluted type. The latter is made with taper and parallel shanks the same as a drill. It may also have a shank of any special shape to fit a certain holder. The machine reamer is generally, tho not always, made straight or parallel, from E to D, Fig. 2.

A reamer having a flute parallel with its axis has a slight tendency to draw in. To overcome this, some mechanics prefer the flutes of both hand and machine reamers, made in the form of a left-hand spiral. The angle of the spiral or helix may be from 4 to 8 degrees.

Another form is the so-called *rose* reamer. Its name is derived from the fact that its cutting end resembles a rose. It is essentially an end-cutting tool and is rarely used for other than machine work. The rose reamer has chip and oil grooves on the sides and is made with any shank required in machine work. This reamer has the larger diameter at its cutting end, and tapers back at about the same rate as the hand-fluted reamer, viz.: .0002 inch per inch of length.

The object of the taper on the fluted reamer is to counteract the tendency of all such reamers to produce a hole larger at the outer end. The rose reamer as well as the twist drill have the taper for the same reason, viz: for clearance.



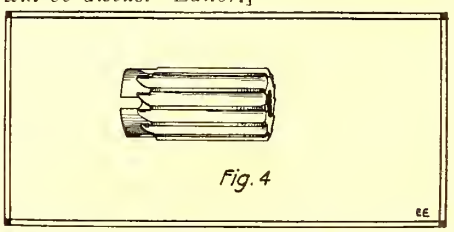
As compared with the fluted reamer, the rose reamer has one advantage, in that when new it will make holes more uniform in size and shape, but has the disadvantage that when the cutting lips are worn, it will bind on the sides and roughen the hole. If the fluted reamer becomes slightly worn at the end, it will still cut on the sides, but because of its cutting on the sides, it is more likely to be deflected by imperfections of the hole, or to cut larger than its fixt size.

As above stated, the standard fluted reamer should be used for *finishing cuts* only. However, the rose reamer can be utilized for roughing or finishing cuts. When the same reamer is used for both purposes, it becomes unreliable as a standard finishing tool. A good illustration of the rose reamer is shown in Fig. 3.

Another type is the *shell* reamer, which is identical in construction to the fluted and rose reamers, with regard to cutting edges, but differs in that the reamer proper is placed upon an arbor, thus saving in cost of material. It will be seen, however, that when the reamer becomes worn to such an extent that its accuracy is destroyed, it should be replaced by a new one, which occupies the same position on the arbor. Fig. 4 illustrates a typical shell reamer. The arbor drives the shell thru the engagement of its key with a rectangular slot cut across the rectangular shell. These reamers are made with either straight or spiral flutes.

The *shells* as ordinarily made are rather short for hand reaming. They are designed mainly for machine work. The taper begins at the cutting end, and the diameter decreases toward the opposite end in about the same ratio as the reamers previously described.

When these reamers wear .0003 inch to .001 inch below standard size, it is necessary to reset or regrind them to a smaller



Typical Rose Reamer. This Is Used Considerably for Roughing and Finishing Work, but One Reamer Should Not Be Utilized for Both Purposes, as Inaccuracy Is Bound to Result.

size. Resetting consists in enlarging the diameter of the reamer by hammer blows in connection with a form of *set* or calking tool. The latter, which may be made by grinding a common chisel flat on the end, is held against the front of the cutting edges for this purpose. It is necessary to anneal the reamer for resetting, and each cutting edge must be treated until the diameter is about 1/64 inch larger than the standard. Having completed this work, the reamer is now retempered and brought to final size by *grinding.* This is usually accomplisht by placing the reamer in a Universal precision grinding machine.

Before grinding the reamer, its center should be carefully cleaned of any dirt or other foreign matter that may have adhered to it. A point scraper made from a three-cornered file answers well for this purpose. After scraping the centers it is usually necessary to lap them. For this process we *chuck* a short brass rod in the lathe and turn the end to the shape of the lathe centers. Having smeared this conical end with fine emery and oil, the reamer is placed on the center of the lathe and started at the greatest speed attainable. The reamer center is lapt by alternately forcing it against and releasing it from the revolving brass. This is done by light pressure with the tail spindle, and for each time that the reamer is prest against the brass it should be revolved slightly. By thus revolving it, we distribute the emery and counteract the tendency of the lap to scratch rings in the center. It is sometimes necessary to return the lap before finishing one reamer; but a skillful workman can do this in ten minutes or less. Instead of having to chuck the lap each time it is used, it would be better to make one to fit the hole in the lathe spindle directly.

[*In the next installment the subject of adjustable reamers and grinding of reamers will be discust—Editor.*]

A Shell Reamer. An Arbor or Shaft Supports the Reamer When in Use. They Are Held by a Key on the Shaft and Are Made With Straight or Spiral Flutes.

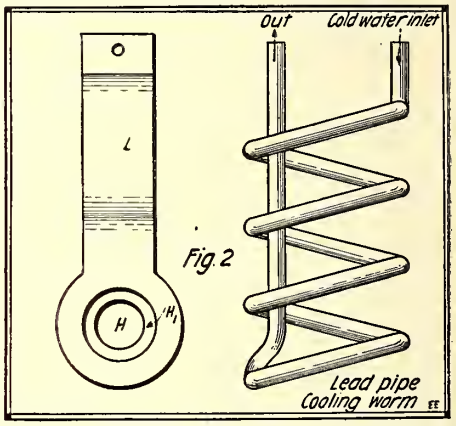
HOW-TO-MAKE-IT

This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

Automatic Electrolytic Interrupter

FIRST PRIZE, $3.00

After having experienced considerable trouble in devising a satisfactory electrolytic



A Really Good Design of Home-made Electrolytic Interrupter.

interrupter, I succeeded in constructing the one described herewith in which most of the faults of its predecessors are eliminated. The greatest of these faults was the dropping of the rod electrode, thus short-circuiting the device. The materials required outside of the battery jar and wooden top, which must be boiled in paraffin to render it impervious to moisture, are: One-half pound of lead, about five inches of glass tubing, having an internal diameter of one-sixteenth inch, three binding posts, a small strip of brass and a small porcelain cup (used for mixing water colors).

The lead electrode is cast in the shape shown in Fig. 2. A hole somewhat smaller than the cup is bored in the large end. A rabbet, H^1, is cut around the edge of this hole so that the cup will fit into it. The lead electrode is now completed and fastened to the top with a machine screw and binding post. The top has a cup-shaped cavity reamed out as shown at C, Fig. 1, which is as deep as one-half the thickness of the top. A hole is bored in the center to receive the end of the glass tube, which should fit tight. The bottom of the tube is about three-sixteenths of an inch above the porcelain cup. The cavity also has a small hole G, Fig. 1, in one side to furnish an outlet for the solution which rises in the tube. A brass strip about one-quarter of an inch wide is fastened across the top of the cavity with a wood screw, binding post and a small screw. This strip has a small hole in the center for the rod electrode to pass thru. The rod is best made of phosphor bronze, and should fit the tube loosely. It has a binding post on top to serve as a weight and for connections. The interrupter is now complete, and should be filled to within an inch and a half of the top with a 10 per cent. solution of sulfuric acid.

The action of this interrupter is as follows: As the rod is worn away by the action of the solution, it is impelled downward by the weight on top, the porcelain cup preventing it from going too far. In case it

Detail of Lead Electrode and Lead Cooling Worm for Home-made Electrolytic Interrupter.

is desired to operate this interrupter continually for any length of time, it may be cooled by immersing in a large jar of water, or else by inserting a cold water cooling worm in the solution, after the design here pictured.

Clever Multiple Switch

SECOND PRIZE, $2.00

I submit herewith an idea for using a motor commutator as a rotary multiple point switch. This sort of switch is useful where it is desirable to economize on space, as on the secondary of a loose coupler.

This switch is, moreover, thoroly dust proof, as it is always on the inside of the cabinet.

Contributed by R. C. SMOLLEN.

This Classy Multiple Point Coupler and Battery Switch Is Constructed From a Small Commutator.

Send us some of your good ideas. We pay for all articles publisht. Address the Editor How-To-Make-It Dept.

THE PHONOGRAPH AS A TEACHER.

Many amateurs object to the use of a phonograph for learning wireless telegraphy because of the fact that the sound coming from the phonograph is in no way similar to the actual wireless message.

Close the doors of the machine and place a telephone transmitter on the inside. Or, better still, place the transmitter directly on the end of the tone arm. This latter method can be used with any make of phonograph. Then connect a telephone receiver (or a number of telephone receivers in parallel) in series with the transmitter and a few batteries.

This method overcomes all objections to the phonograph method and is much better than the omnigraph method since the phonograph records can be made to represent two stations of a different pitch sending at the same time, interference, etc. When you tire of listening to radio signals put on an ordinary record and have a "wireless" concert. What?

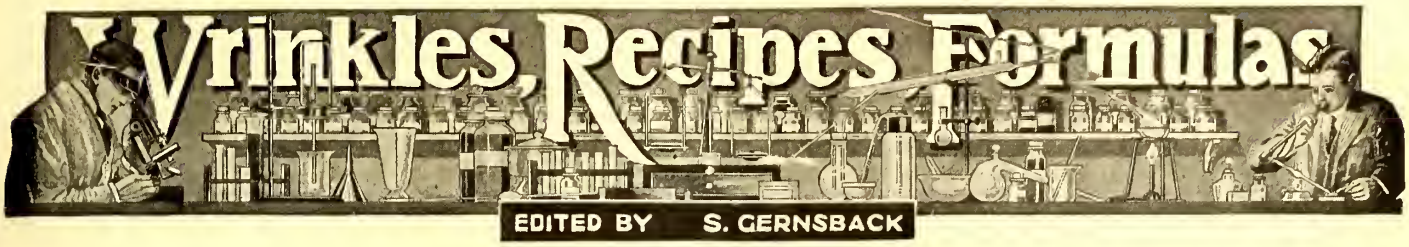
"Collar Button" Push Button

THIRD PRIZE, $1.00

Here is a push button designed to use up all your waste material and make you buy more collar buttons. Bore the holes as shown in a two by one-half inch block of wood, screw on the metal plate D, with the brass spring C insulated from it by the wood or fiber E, slip in your collar button B, glue on the thin piece of wood F, and Eureka! there you have it!



I know my friends will surely bless me for this valuable contribution to Science in the Home. Pa can rest his mind hereafter —when the shirt button drops, he will know it's gone to help the cause of true Science.

Contributed by RAY BILLINGTON.

At Last! The "Collar Button" Push Button. Papa Will Never Find His Collar Buttons Now, When They Roll Away Under the Bed. Little "Willie" Will See to That!

TELL-TALE FOR REFRIGERATOR DRIP PAN.

This tell-tale for an ice box drip-pan consists of a piece of hard wood or fiber cut into the form (A). A piece of No. 14 copper wire is bent into the form (C). This form is allowed to turn on pivot (E), which is a current carrying part of the circuit. When the pan is full of water, the form (C) floats up by means of a piece of wood (cork is good) attached to the end. The copper wire makes contact with (D), and the bell rings, indicating that the pan is full. The notch (B) makes it possible to take the device off when emptying the pan.

Simplicity Is Stamped All Over This Home-made Refrigerator Drip-pan Alarm. It Costs But a Few Cents to Make and Will Save Your Carpets and Hard-wood Floors.

HINTS ON LABORATORY APPARATUS.

By Eugene McGowan

To most experimenters chemistry undoubtedly proves a most interesting study. However the chief fault lies in the fact that things mess up so easily. The following is intended to overcome this difficulty.

First of all the laboratory should be arranged so that the one who uses the room may be able to find everything he wants.

A gross of empty wooden boxes, 12 inches x 8 inches x 4 inches, will be found convenient for keeping dry reagents in.

Labels should be used freely, and all unlabelled bottles washed out. Paper labels on bottles may be protected by a coating of paraffin wax varnish or shellac. But most bottles should have some label in the substance of the glass. These are made in two forms. Enamel labels are melted on the glass. They last well, but white enamel is not always distinct when white crystals are in the bottle. Sand-blast labels are made by roughening the surface of the glass with a jet of sand driven by a blast of air. They are apt to be indistinct when wet, if not made with a really rough surface. They can be made more distinct by rubbing over with crayon or chalk. Sand blast labels cost only about half as much as enamel labels.

Retort stands should be firm and substantial. The sliding collars for the rings should be slotted at the sides, so as to move easily; and a good clamp should be chosen with well-made screw threads.

Deflagrating spoons can be cleaned by holding the cup in the Bunsen flame for a few seconds.

Bunsen burners occasionally get blocked by some molten substance falling into the inner tube. They may be cleaned by washing with water. After washing blow thru the burner to remove any drop of water which may clog the exit. The revolving tube or ring should be frequently turned, so as to keep it in order; otherwise they get jammed and it is impossible to change quickly from a yellow to a blue flame.

Balances should turn with much less than a centigram. Balances with steel knife-edges, if protected from the air of the laboratory, will remain serviceable for years. Those with agate edges set in steel are more durable, but are more expensive. Weights less than a centigram are needless, and cause trouble to beginners. More exact weighing can always be done by watching the pointer, if the weights are accurate.

Management of mercury. Mercury is difficult to manage, on account of its weight and the ease with which it picks up impurities. Stone-ware mortars are better for holding mercury than glass beakers, which easily crack when set down. All operations with mercury should be conducted over a tray or on a table with a groove around the edge.

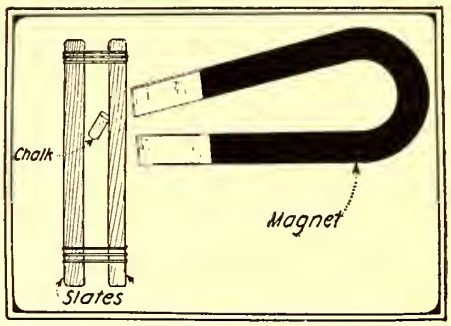
Dust on the surface of mercury may be removed by allowing the mercury to run thru a dry filter paper in which a few pin holes have been made. Or the mercury may be washed in a current of water, and then past thru a separating funnel. The little moisture on the surface may be removed with a blotting paper. Many metals easily dissolve in mercury; and a very little tin or zinc will spoil its fluidity. They are best removed by shaking the mercury in a bottle with a little nitric acid; the tin or zinc will then dissolve, leaving the mercury pure.

A few words of caution concerning the care of reagent bottles are in place here. A good reagent bottle must have its stopper ground to fit it, and this stopper will not fit any other bottle you may have. Consequently the stoppers should never be interchanged. Again, the stoppers of all reagent bottles, excepting sulfuric acid, should be paraffined, otherwise they are apt to stick.

Do not lay down the cork of a reagent bottle while pouring out a solution, as the stoppers may become changed. Again, no solution but the one corresponding to the name on the bottle should ever be placed in the bottle.

Another important item is that each bottle shall have its own particular place on the shelf, and always be put in its place; thus the amateur chemist will know exactly where to find the proper reagent, just as a printer knows where to find the letters in his case, by prearrangement.

USE FOR AN ATOMIZER.



An atomizer is a handy appliance to furnish a draft of air when drying precipitates or evaporating solvents like ether or chloroform. The drying of precipitates and crystals can best be carried out when same is placed on a blotter to help absorb the liquid.

"SPIRIT" SLATE-WRITING.

Two thin slates are brought forth and offered for examination by the audience. The operator then places in between the two plates a small piece of chalk and hands the two slates to some-one (it does not matter whom) to tie with a string or seal all around with scaling-wax. After a few minutes or so, the slates are taken apart and Presto! there is found a message from the "spirit world" written with the chalk, which was placed in there by the "Medium."

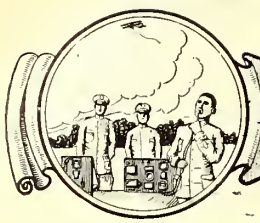
The way it's done is this:

The chalk is of special formation; it is made of chalk dust mixed with iron-filings and a little glue. A strong (need not be very big) magnet is used to make the chalk move and write the message. The "Medium" located the chalk by tipping the slates to one corner and placing the magnet under it.

"Spirit" Slate Writing May Be Performed With This Simple Apparatus. The Chalk Container Could Very Well Be a Small Perforated Ball Filled With Powdered Chalk. The Slates Should Be Held Horizontally.

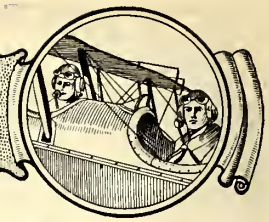
This works better in the dark for the simple reason that the people will not notice the magnet and its use. The darker the better.

Contributed by GEORGE PASTO.



MAKING THE MOST OF A LITTLE SPACE.

It is most discouraging to have to spend half-an-hour finding tools and impedimenta before starting an hour's work in the evening. The remedy is to have a place for everything, and keep everything in its place. Also, keep them as compactly as possible. A good deal of extra room can be got out of an ordinary cupboard by the exercise of a little ingenuity. Things not often required should be kept on the top shelf. Perhaps there is still some space to spare. Then tack a piece of cloth or a large handkerchief inside the top of the cupboard, and screw in a couple of brass screw hooks a few inches from the ends. Sew a brass ring to each of the free corners of the cloth and you have a sort of cradle in which many odd things may be suspended by slipping the rings over the hooks.



A dozen wooden soap or sugar boxes, stood one above another in a corner of the room, preferably in a recess, will do duty for a cupboard. Capital shelves can be made inside the boxes, using wood from the lids, while the whole structure can be effectually disguised during the daytime by covering it with a piece of dark colored material. Extra room can be made by fixing hooks to the outside edges of the boxes for things that can be hung up, while other odds and ends can be dropt into cocoa tins and the like tacked to the sides of the boxes.

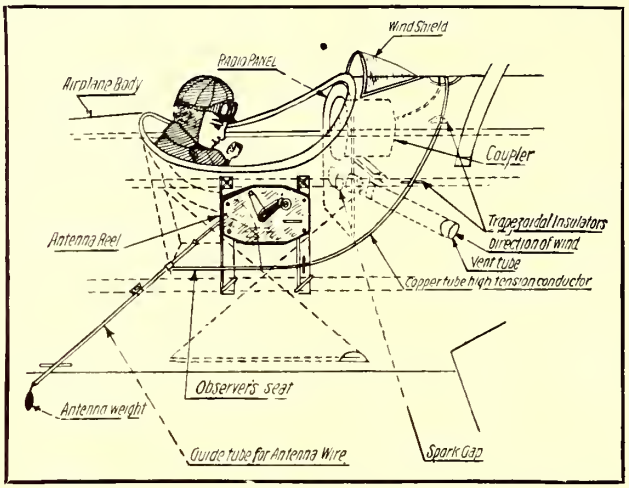
RADIO DEPARTMENT



Airplane Antenna Reels

By LESTER F. RYAN

ONE of the most important parts of the antenna system in connection with airplane radio work is the *antenna reel*. Electrically, the antenna system of a radio transmitter consists of a single trailing wire and a counterpoise. The antenna wire is lowered from the airplane during flight by a hand reel and trails out to a distance of about 300 feet, at an angle of 20 degrees to the fuselage.

The antenna reel, as illustrated in Fig. 1, is so designed in order to stand all mechanical and electrical stresses under difficult service conditions.

It is constructed entirely of the highest grade insulating material and will therefore stand the high antenna voltages which are developed by the high power of the transmitter without leakage and danger to the operator.

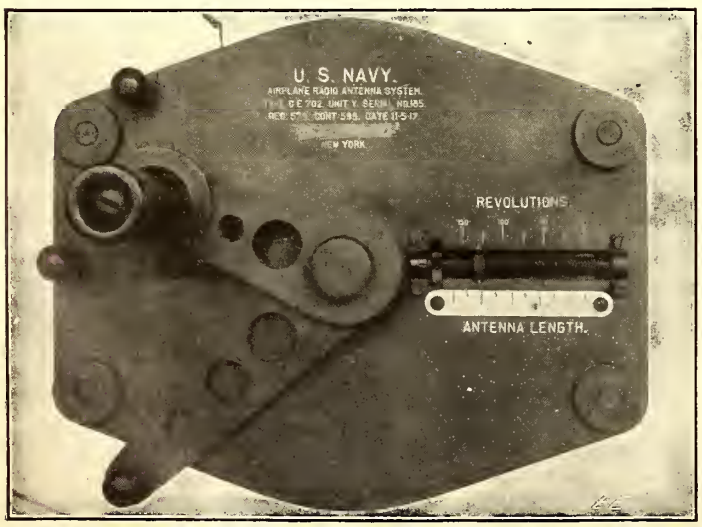
Arrangement of Airplane Antenna Reel On Outside of Cockpit. The Reel Is Self-locking and Also Indicates At a Glance How Many Feet of Aërial Cable the Aviator Has Let Out. The Cable Runs Thru a Guide Tube As Shown. Thousands of Sets Like Those Shown Were Used During the War.

The drum of the reel will hold 600 feet of stranded phosfor bronze or other antenna cable, i.e., if one antenna of 300 feet of wire is lost, an additional antenna of 300 feet is still available. It is provided with a revolution counter as shown in figure which indicates the number of turns or feet of antenna wire in use.

It is also fitted with a *brake* or locking device, which is used to lock the drum when the reel is not in use. This brake may also be used to control the speed of the unwinding. The antenna wire is of tinned copper, and has a breaking strength of 400 pounds.

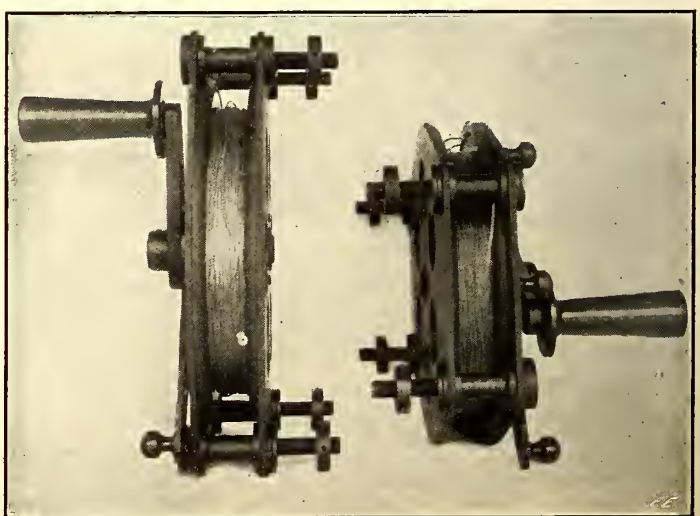
To prevent chafing and breakage of the antenna wire near the weight when the antenna is reeled in, due to the swinging of the weight, a stiff phosfor bronze wire is connected between the antenna wire and the swivel hook. A swivel hook is placed at the end of the tail wire to prevent spinning of the weight during flight. The weight is of lead, and weighs 1¾ pounds. It is of stream-line form to reduce wind resistance to a minimum.

The insulators used are of trapezoidal shape and serve the purpose of insulating the guide tube from the airplane. The flattened end of the trapezoid is made fast to the copper tube; the opposite base is made fast to the airplane fuselage.



To prevent *sparking* or *grounding* of the antenna to the cowl a *cowl insulator* is used. It is made of bakelized canvas, six inches in diameter, with holes near its perifery for lashing to the cowl.

When installing the antenna system on a 'plane, great care must be taken to provide sufficient insulation against the high voltages developed by the transmitter. As a rule, the antenna reel is mounted outside of the fuselage on the right-hand side of the plane, as here shown. It is attached to two vertical pieces of wood which are lashed to the upper main and seat *longerons*. These pieces contain holes corresponding to the four attachment legs of the reels, and thru which these legs extend to the inside of the fuselage. The circular bakelite nuts, as shown in figure, secure the reel posts to these uprights. The copper guide tube thru which the antenna cable slides after leaving the reel is supported beneath and rearward from the antenna reel at an angle of about 20 degrees to the fuselage. It extends 6 inches beneath the fuselage, and is separated by insulators.



The connection between the antenna helix on the set and the antenna guide tube is as follows: The antenna helix is connected to the lower end of the cowl insulator as shown in figure by rubber-covered cable. The cowl insulator is connected with the antenna guide tube by means of a six-foot length of 0.180-inch copper tubing. The antenna wire is connected to the antenna reel by means of a hole thru the bakelite shaft on which the handle is fastened.

When properly installed, the antenna system should cause no trouble. The antenna reel may safely be operated while sending and is without doubt one of the most ingenious and novel features developed in airplane radio transmitters. This type of antenna reel is used in conjunction with the airplane transmitter described in the July issue of the *Radio Amateur News*.

The modern practise in airplane radiotelegraphy and telephony calls for the use of two antenna cables, let out from either side of the airplane. These cables have weights as usual.

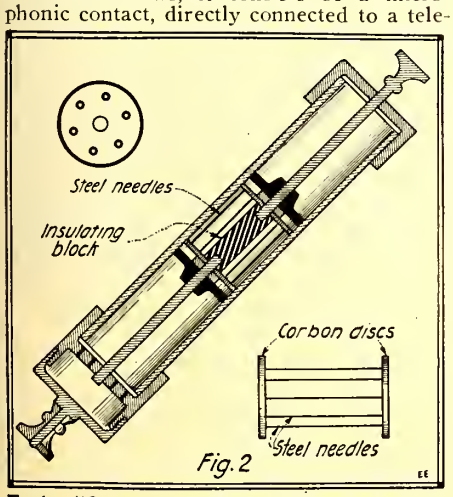
How I Invented the Crystal Detector

By GREENLEAF WHITTIER PICKARD



SPECIALLY WRITTEN FOR THE "ELECTRICAL EXPERIMENTER"

IN 1874 Prof. Ferdinand Braun discovered *unilateral conductivity* in a number of the natural metallic sulfids, such as pyrite, galena and chalcopyrite His observations were limited to the application of battery current to metallic contacts on the minerals, and he noted that a materially larger current would flow in one direction than in the other. Five years later, in 1879, Prof. D. E. Hughes, while experimenting with a carbon microphone, discovered that it was affected by a distant spark discharge, altho there was no wire connection between the circuits. Altho Prof. Hughes did not publish an account of his experiments until 1899, he exhibited his apparatus in operation, over distances as great as 1,500 feet, to many of the prominent English physicists, including Preece, Crookes, Stokes and Dewar. A glance at the circuit employed by Prof. Hughes in 1879 will show that he had the principal elements of the

Hughes 1879 Detector System. B Is the Transmitting Battery, C an Inductance Coil, 1 a Mechanically Operated Interrupter and E a Ground Connection. W is the Receiving Aerial, M a Carbon Microphone, T a Telephone Receiver and E¹ a Ground Connection. Hughes Discovered that the Carbon Microphone Was Affected by a Distant Spark Discharge. Fig. 1.

system re-discovered by Marconi in 1895. Undoubtedly, if Prof. Hughes had had proper encouragement at the time, he would not only have anticipated Hertz in the discovery of electric waves, but also Marconi, in their wonderful application to Radio-telegraphy, and so have altered considerably the course of scientific history. Our immediate interest in Prof. Hughes' work is, however, his detector. As my illustration shows, it consists of a microphonic contact, directly connected to a telephone receiver, and without local battery. It is the germ of the crystal detector.

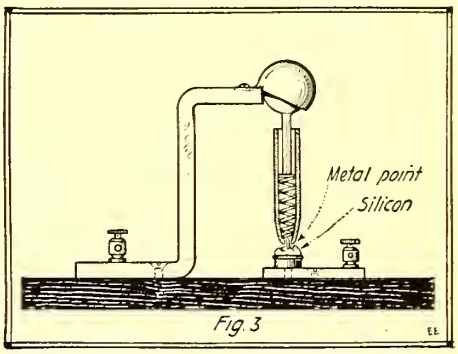
Early "Carbon-Steel" Microphone Detector Used by the Author in 1902 at the Cape May, N. J., Wireless Station.

Dr. Greenleaf Whittier Pickard, Inventor of the Crystal Rectifying Detector. He is Well-known as an Electrical, Telephone, and Radio Engineer and Has Taken Out Numerous Wireless and Other Patents. He Has Tested 31,250 Crystal Detector Combinations.

The Coherer

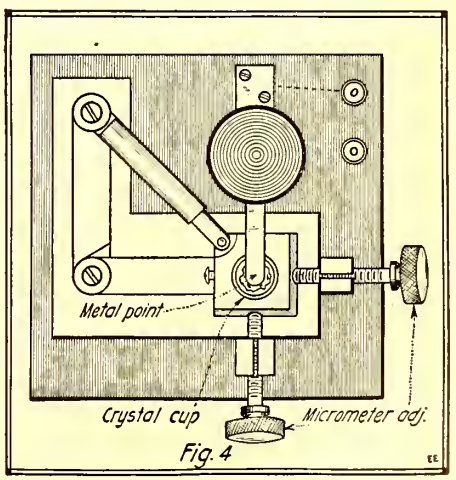
In 1898, when my work in Radio-communication began, there was but one detector—the coherer. To the early workers in this field, the coherer was the *bête noir* of radio-telegraphy; the principal obstacle to assured and speedy communication without wires. Despite its unpleasant idiosyncrasies, the coherer had our deep respect, first because it was the only thing then known which worked, and second because of its *supposed* extreme sensitiveness to electrical oscillations. In the absence of any quantitative measurements, it was generally assumed that the received energy in radio-communication was so infinitesimal as to absolutely preclude its measurement or even detection by ordinary means, such as galvanometers or telephones, even if by some means it could be converted into a form suitable for these instruments. Altho in some of the early laboratory work with electrical waves various forms of thermo-couples and bolometers were used, the practical workers never considered these as possibilities in actual radio-telegraphy, because of the supposed extremely minute character of the received currents, to which such a device as the coherer could alone respond. In common with the other workers at that time, I held the same view of radio reception, and spent much time in attempts to improve the coherer as to regularity of action.

FEW inventions in radio have been made which proved of such tremendous importance to the young art than the Crystal Detector, invented by Dr. Greenleaf Whittier Pickard. In the olden days of the coherer, when we were still groping in the dark, only comparatively small distances could be bridged. The invention of the Crystal Detector may be said to have opened up an entirely new era in radio, for with the coming of this detector great distances were easily bridged and almost perfect communication was possible at all times. "Wireless" had arrived.



But you will want to read the story of how Dr. Pickard invented the Crystal Detector yourself. It is a historical classic. We promise you twenty minutes of most unusual as well as instructive reading.—EDITOR.

The Microphone Detector.



Much of the trouble in coherer working arose from the adjustments of the coherer adjuncts, the relay-tapper-recorder trio. Realizing this, in the latter part of 1899 I began experiments with a *single contact coherer,* in series with a battery and telephone receiver. I soon found, as several others did at about the same time, that a simple carbon steel microphone consisting of a sewing needle resting lightly against a carbon block, in series with a cell or two of dry battery and a telephone receiver, formed a most effective detector, exceeding the coherer in sensitiveness, speed of working and reliability. And, best of all, I found that this combination permitted a considerable degree of discrimination between Morse signals and static, which was not possest at all by the coherer-relay-tapper-recorder combination. All was fish that came to the coherer net, and the recorder wrote down dot and dash combinations quite impartially for legitimate signals, static disturbances, a slipping trolley several blocks away and even the turning on and off of electric lights in the building. Translation of the tape frequently required a brilliant "imagination!"

Altho the *microphone detector* was a

A Review of Radio-Telephony

RADIO-TELEPHONY has been before the public so frequently of late that an article describing the modern scientific apparatus that has made it possible would not go amiss, it is believed. No one man can claim the credit for *discovering* "radio-telephony," but electromagnetic waves of so-called "radio" frequency were first intentionally produced and studied by Hertz who was guided by the electromagnetic equations deducced by Maxwell, constructed some twenty years earlier. The first radio telegraphic outfit was produced by Hertz, and improved by the discovery of the coherer by Brown, and of the invention of the present form of antennae first by Tesla, followed by Marconi, which allows the radiation of large power by long waves.

Battleship Radio-telephone Set—Schematic Circuit Diagram. Showing Microphone Modulator Circuit, Talking Key, etc. Note How the Vacuum Bulbs are Connected on Parallel.

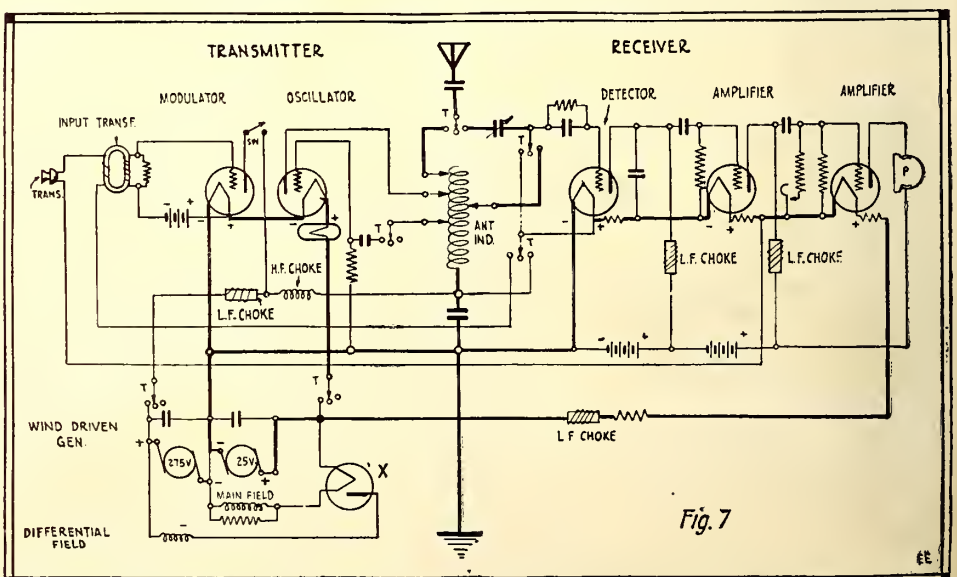
At an early date it was realized that a crystal detector in combination with a telephone would produce in the telephone, currents whose amplitudes varied approximately as the amplitudes of the received high frequency wave, and consequently if the amplitude of this wave could be varied at the transmitting station in accordance with speech, radio telephony would be possible.

The receiving apparatus was therefore in existence and all that was necessary was a means of *varying the amplitude* of the transmitting wave. In regular wire telephony, the amplitude is so varied by *microphones*, and of course this device was at once applied to radio-telephony. The great trouble lay, however, in the fact that microphones, even when especially designed, cannot easily be made to carry large currents and still function properly. Because of this handicap, numerous voice-operated resistance-varying devices appeared. Using methods of this kind, considerable success was obtained, and in 1912 Vanni succeeded in telephoning 1,000 kilometers.

During the years of 1912 to 1914, a great deal of research work was carried on in connection with the use of the audion in radio-telephony, and in 1914 it was decided that the apparatus was sufficiently developed to warrant an attempt at long range wireless telephony. These tests were so successful, that the Navy Department erected an experimental station at Arlington, Va. The type of power bulb used is shown in Fig. 1. The current, by which the filaments were heated, was supplied by a local power company and brought by underground cable to the station.

Alternating current was used for heating the filament and any possibility of the superposition of a 60 or 120 cycle note, due to the frequency of this current, was eliminated by the use of a special scheme of connections. Between the plate and the filament of the power tube a constant voltage of about 500 volts was imprest. It was obtained from one of the motor generators used by the Navy in operating the large Poulsen arc, with which they were then transmitting to Darien and other remote points.

The immense racks containing the power tubes are shown in Fig. 2. At the left in this figure is the remote control for operating the motor generator set in the main Navy radio station at Arlington, and also for metering the currents used for lighting the plant and other such auxiliary purposes.



The first opportunity to demonstrate the use of wireless telephony in war was presented early in 1916. After several trials and experiments, the first radio telephone set installed on a battleship was placed on the U. S. S. *New Hampshire*. This set differed from the one in Arlington only in size. The set was installed on the lower bridge deck, and the telephone transmitter and receiver were mounted on the bridge itself. This allowed the captain, while on the bridge, to converse without leaving his post.

After many successful trials, it was decided to install two experimental sets on other battleships and give the operating staff an opportunity to investigate and criticize them. These sets were installed on the battleships *Arkansas* and *Florida* at Guantanamo, Cuba, the first part of February, 1916. It was found entirely practicable to hold a two-way conversation between vessels over 30 miles apart. There is no reason to think that this was the limit of communication as some of these conversations were overheard in Jamaica, a distance of 175 miles. No attempt was made for range as that was not the object in building these sets.

Each set consisted of a transmitting and receiving set complete with motor-generators. An extension circuit was provided so as to allow placing a hand set in the captain's cabin. The normal position of the antennae was connected to the receiving set in order to hear incoming signals. When it was desired to talk, a push button operated a solenoid switch which connected the antennae to the transmitting set and started the motor-generator. This operation consumed only a fraction of a second. The wave length range of this set was from 600 to 1,200 meters. The complete circuit is shown in Fig. 3.

The greatest success with radio-telephony has been accomplisht in connection with military work in the air. On May 22, 1917, Major General Squier, Chief Signal Officer of the Army, called a conference at Washington to consider the feasibility of intercommunication between airplanes while in flight by means of radio-telephony. There were present at this conference, besides General Squier, Colonel Rees, of the Royal Flying Crops of Great Britain, Captain, now Colonel, C. C. Culver, of the Signal Corps, and Major, later Lieut. Colonel, F. B. Jewett, and Captain, later Major, E. B. Craft, who had been assigned

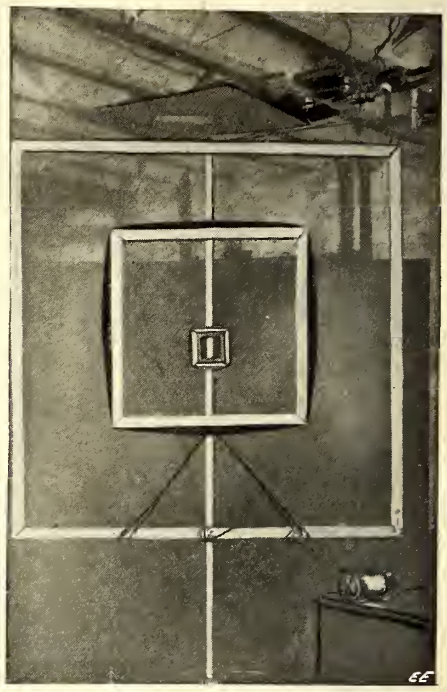
Concentrated or Loop Aërials

By Prof. Lloyd M. Knoll, A. M.

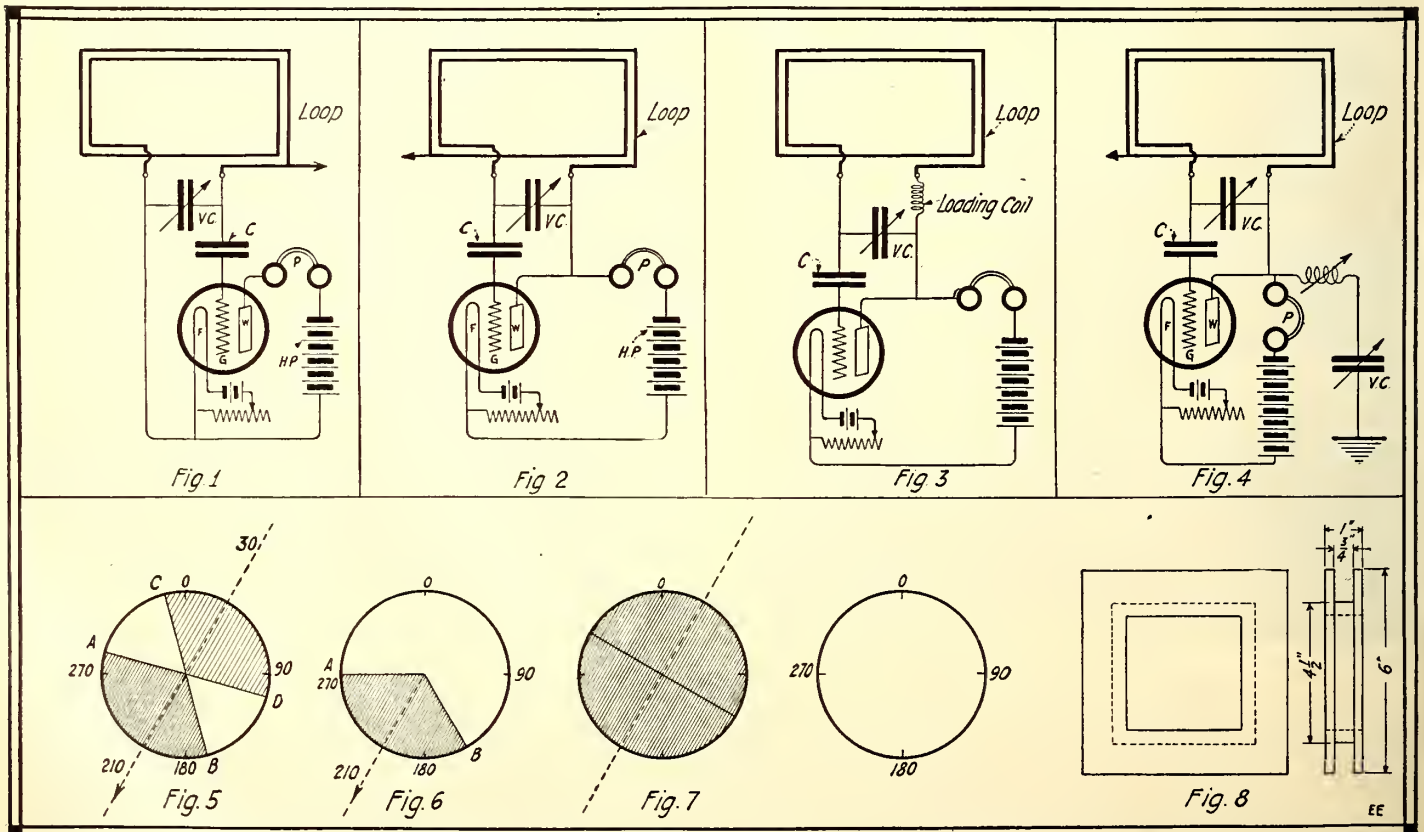
SEVERAL freaks and dreams of radio experimenters before the war have been realized in a device developed by the writer, in connection with the 4th Naval District. Not only does the device eliminate a large amount of interference from other stations of the same wave length, but like the Rogers underground system, eliminates



The Author and One of His Loop Aërial Radio Receiving Sets.

static as well, and being in a highly concentrated form it brings the outfit within the reach of the Radio Amateur. It is specially useful for the city wireless "Bug" who has limited space or a fussy landlord to contend with. It is no longer necessary to put poles on some high building, string aërials over large areas of ground nor even to tap an old 'phone line. The dream of the experimenter that some day he might put a nail in a flower pot for a ground and run a wire to a nail on the wall of his room is eclipsed and now the camper or tourist can pack a grip and be sure of always being in radio touch with the world.

Many operators will recall how it was easier to get certain stations when the aërial was disconnected from the set. This freak (?) set the writer and his friend, Mr. T. Appleby, to work to solve the problem of receiving regularly without an aërial and their results were put at the disposal of the government with the declaration of hostilities, and is only now being made public. Mr. (now Lieut.) Appleby discovered that the device had a strong *directional effect*. Later the writer concentrated the apparatus and discovered the way to eliminate static as well.



The extreme simplicity of the outfit is one of its most striking features. In fact the amateur has all the parts needed and early systems employed very much the same features but on a large scale. A loop of wire of proper proportions, a detector (a vacuum tube is most sensitive but not necessary), a pair of 'phones, the proper connections, and there you are. In the photograph may be seen a set in operation receiving on 2,500 meters wave length. Fig. 2 shows the receiving hook-up employed. As stated before there is a decided *directional effect* and if the loop is mounted in a vertical plane and rotated around a vertical axis, a remarkable fact is noticed. For example, suppose Fig. 5 to be taken as the circle described by the loop. Now if the signal is coming from a point along a line 210° from North, then if the end of the loop connected to the

Some of the Author's Loop Antennae. A Small Aërial of This Type Has Picked Up Messages From Stations 200 Miles Away.

grid of the audion or v. t. moves from A to B, there will be an increase and then a decrease in the intensity of the signal;

To War on an American Destroyer

A Radio Operator's Experience Chasing the U-Boats

By A. H. WHEDON

TO begin with, let it be known that the author spent sixteen long, weary months with the United States Destroyer flotilla based in Queenstown, Ireland, and therefore feels competent to write the following few remarks.

The American destroyers arrived in Queenstown, Ireland, on the fourth day of May, 1917, after a ten-day trip across the Atlantic, during which time our radio transmitting apparatus was not used more than three or four times. You see, when we left the States we had no idea of what we were going into. Our idea of the German submarine question had been entirely derived from reading the newspapers. Consequently, we imagined that we would see a *dozen or so a day,* and that when a merchantship used her radio, several submarines got her position by a direction-finder, and sallied forth to attack her. Naturally, we were very quiet with our own radio instruments, and were terribly disappointed when we reached port without seeing a single "sub."

A "Lime-juicer" (English Sailor) Radio Operator Trying to Decipher What the Blankty-Blank the Yank's Code Message Means.

Don't Look at this Scene too Long or You'll Get Seasick. It Represents What the Radio Room on a "Destroyer" Looks Like In a Heavy Sea.

The Radio Room on the "Destroyer" Had a Leaky Ventilator in the Roof. What Didn't Happen in Those Two Awful Days Off Brest, France,—COULDN'T.

When we reached Queenstown, the British Admiralty Authorities came aboard to look us over and to hold a conference with our officers. One of the results of the conference was the determination to use the British method of radio-communication. They called it W/T (Wireless Telegraph). Of course, the code was the same, but there the resemblance between the two systems ended. And perhaps you think it was easy to forget, after years of thoro training, the things that came as second nature to us and to substitute absolutely new stuff—it was not very simple.

And when it came to working with the "Limy" (British) ships and stations—my, my! They sent at the terrific speed of sixteen to twenty words per minute. Twenty words was their high speed limit. The American operators who first went over there were all picked men, and their speed varied from twenty-seven to thirty-four, and to come down to sweet sixteen, once again meant hard work!

But gradually, as we operated with them, their receiving speed increased, and likewise did their transmitting speed, and again our troubles were increased. Very few of you, probably, have ever heard a "Limy" spark in action, but most of you are fairly familiar with the sound of a low frequency buzz-saw, and believe one who knows, there is not enough difference between them to be happy about. And then, when they started to speed up on a spark like that—can you imagine it?

Another trifling (?) detail (?) that bothered us was the fact that everybody and everything dashed off on the one wave length—600 meters. And altho there was an order out to the effect that radio work was to be reduced to a minimum, very few people ever took any notice of it. Consequently, in the Irish Sea there was an awful mixup, for on the English coast there are Liverpool, Fishguard and Land's End. Opposite them, a few miles away on the Irish coast, there are Belfast, Dublin and Queenstown, and when all of these stations are trying to work on the same wave length, to say nothing of all the ships in the Irish Sea, there is, to say the least, a *little* interference. But as the English boats are not equipt with an efficient wave changer, as are all our boats, nothing was ever done about it. Gradually the problem resolved itself into the equation: "The guy with the most power wins," for nobody would ever keep quiet long enough to let the other fellow work. There was a time when I, personally, had a message to send to Liverpool. It took 5 K. W. for 100 miles.

The English are not renowned for their quick perception. We found that fact out to our sorrow. Altho "playing flats" (unauthorized conversation) is not permitted in either Navy, there are times when it is necessary to talk to the other fellow about a message, or on similar subjects. Of course, such conversation must necessarily be as short as possible. In the U. S. Navy every word is abbreviated in this unofficial conversation. For instance, one operator wants to ask another "What is the check on message number one?" It would be transmitted: "Wht ck msg one." After the answer would come "Tks" for "Thanks."

There was an occasion when my ship, the U. S. S. *Conyngham* was in company with the H. M. S. *Snowdrop,* a boat of the "sloop" type, developed during the war. My sending set wasn't working any too well, but as I had a long message to send him, I decided to make a try at it. So I opened up and started. Very shortly I began to miss sparks, so I signalled over "ST BI 5 TRANS BRKN DWN," meaning "Stand by for five minutes. My transmitter is broken down." There was complete silence for a few seconds, while he tried to puzzle it out. Then he came back with a great big question mark. I thought it possible that I had been a trifle speedy for him, so I made a hasty connection and sent it again, more slowly. More silence. Then more question marks. By that time I had fixt my set up, and was just about to start in on friend "lime-juicer" with the message, when he came across with the conventional signal for "Your Morse is unreadable. Put a competent W/T operator on watch." That was all the thanks I got for trying to tell him to wait a minute.

There may be some of you who think that radio in the Navy is a soft job. Well, it is—on a decent sized ship that knows enough not to roll and pitch *all* the time.

How to Develop Your Inventive Ability

By JAY G. HOBSON

(Author of "How to Finance and Manufacture a Patent")

AFTER many years of careful research into the mysteries of the human mind psychologists have concluded that every normal person is an inventor by nature, having inventive faculties to a certain degree.

The Automatic Restaurant Is a Clean Place To Eat, Isn't It? But Why Must We Allow People With Dirty Hands To Fumble Around In the Spoon, Knife and Fork Receptacle? Why Not Invent a "Dispenser" for the "Eating Tools?"

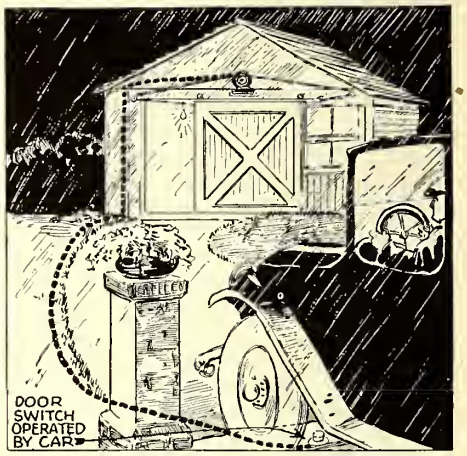
Many have developed these talents further than others, but the fact that we are all inventors naturally is of great importance to every one aspiring to create something of value to mankind and themselves. While we are assured that each individual is capable of creating, improving and originating new and useful things, yet most of us find considerable difficulty in deciding upon the best and surest course to pursue in order to develop our inventive qualities to a point of efficiency necessary to cash our ideas for their full worth.

Inventive ability is simply the power of close observation, scrutiny, imagination and analyzation of material things as they exist with the way they might be made to exist, if constructed in a different form. All things have at some time or other been the result of some dreamer's or some thinker's imagination and—observation crystallized into a mental picture, then developed until it has merged into actual form, a complete, improved article of practical worth.

The practise of observation, imagination,

Why Can't We Go to the Theatre and Find a Clothes Compartment in the Back of the Seat That Disappears Into the Basement When You Sit Down? Nobody Ever Thought of It!

constructive investigation and analyzation will develop this inventive ability and in time make it both perfect and prolific. But there are certain proven ways that help this development more than others. Idle curiosity over things will not promote the inventive training and is not constructive observation or investigation. Investigation, observation and analyzation must be done systematically and with a sincere aim in view. There must be a serious desire for betterment and improvement in mind to find that improvement or invention worth while.



The great revolutionary inventions are few and far between, but when they do appear it is evident that some sincere mind has striven to create a working device of his mental picture which was undoubtedly conceived by a fervent desire to produce an improvement over unsatisfactory conditions as they were in the time of the conception. Or probably it was the aspiration to give the world a device that would save unnecessary labor, prolong life, or improve commercial intercourse for big business. However, it is establisht that to originate or create improvements of value, one must train his mind and imagination to picture things as they should be and then stick to his mental idea until it successfully matures into a practical device of certain operation.

There are numerous examples of inventive development but for illustration we will consider only a few. Elias Howe first observed the pressing need for a machine to do the tedious labor of sewing that in his day was entirely done by hand. After observation came investigation of his idea, then a mental picture or imagination of a machine capable of producing the desired result, then came analyzation of mechanical movements necessary to replace the human hand, and finally after years of discouraging effort he succeeded in designing and perfecting a model that not only did what the human hand would do but did it in one-fifth the time. It took Howe years to perfect his first machine mainly because in those days the art of mechanics was only in its infancy, which necessitated his working out of every mechanical detail. Today it is far easier for the inventor. He can conceive the idea, sketch plain plans and drawings and secure assistance to perfect the mechanical details. There are more and greater opportunities to become inventors today than ever. There is more money to be made and quicker. Elias Howe did not labor in vain as his invention made nearly two million dollars in royalties.

The incident of the hair pin and how its inventor observed his wife bending a straight hair pin to prevent it from coming out of the hair is a much hackneyed experience. But only recently an alert young man in Chicago conceived the idea of placing a hump in the neck of the old-fashioned hair pin to prevent it from coming out of the hair. A patent was obtained upon this extremely simple idea, they were offered to the feminine public in attractive packages and now sell by the millions. To date the inventor has made hundreds of thousands out of his simple little improvement, which only goes to prove that nothing is too small or too simple for our consideration and observation, if we would become successful inventors.

The simple ideas are, as a rule, more prolific and prevent infringement to a greater degree. After an idea is received the inventor should strive to picture it in the simplest possible form. *Simplicity in invention is the secret of patent success.*

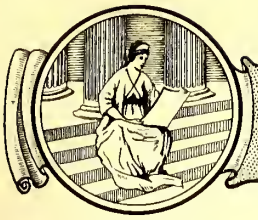
There are five distinct ways in which the mind receives inventive ideas, namely thru the five human or physical senses; sight, taste, smell, feeling and hearing. A

Why Not Invent a Simple and Reliable Garage Door Opener? Thousands of Autoists Everywhere Will Not Only Bless You for It, But Will Buy Them by the Hundred. But It Must Be Cheap in First Cost and Maintenance.

person may see an improvement and patent it, or taste a flavor and create a better one, or smell an odor and design a device to eradicate it, or hear a situation and replace it with a different one.

All inventions have entered the inventor's mind thru one or more of these five ideas-carrying channels before materializing into completed form. The mind is the oven or incubator for hatching these inventive germs and forming them into practical articles for earthly use. Therefore to develop one's inventive faculties it is necessary to develop both the five human senses and also the mind that controls them.

For the purpose of suggesting an effective method of development I will now ask the reader to join me on a little inventive expedition up among the clouds of creation.



Our first imaginative stop will be in the office of a modern business man who is branch manager for a large eastern corporation. It is noon time and our friend decides to go out to lunch. We follow him down the avenue to a cafeteria. He en-

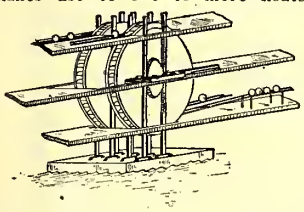
Magnetic Razor.

(No. 1,299,096, issued to Butler Ames.)

A very ingenious idea is this magnetic razor, which makes the cleaning of safety razors a very simple

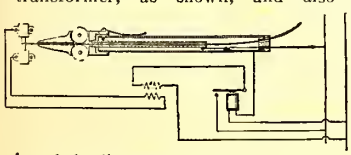


process, as the retaining cap over the razor blade may be instantly removed by pulling it off the magnet cores. The cap and blade members of the razor are adapted to be held in position by a guard member, by magnetic flux passing from one pole of the bi-polar magnet to the other pole, thru the blade and cap, which members are made of steel or other magnetic material.

Tidal-Power Motor.

No. 1,304,238, issued to Judson E. Wright.)

In this tide-motor the inventor makes use of one or more floats,

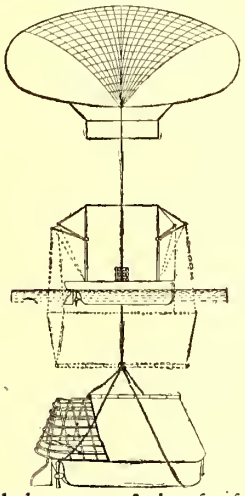


which rise and fall with the tide. The alternate up-and-down movements are made use of thru a pair of gear racks, acting alternately on a pinion or gear wheel as shown. One of the racks acts on the "upward" motion and the other on the "downward" motion, thus preserving a continuous rotary motion in the power wheel. When the action of the tide is low or nil, the power is maintained by a series of spherical weights acting on a bucket wheel connected with an auxiliary power member. These weights are carried to a higher level by the regular tidal motor thru a bucket conveyor.

Electric Soldering Device.

(No. 1,304,545, issued to Frederick A. Costello.)

This soldering device comprises a tubular holder resembling a pencil or pen holder, thru which the wire or strip solder is applied to the work to be united. This holder also carries a circuit-closing switch for the primary of a step-down transformer, as shown, and also

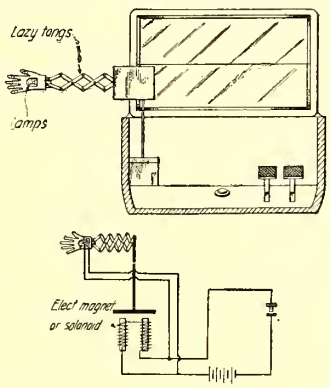


knurled "solder feeding" wheels. The electricity is used only in actually heating the solder when the same is placed in contact with the work to be united by this clever arrangement. A relay serves to open and close the primary circuit of the transformer in the manner evident.

Raising Submarine Vessels.

(No. 1,303,912, issued to Hideo Katayama.)

A clever idea for raising sunken

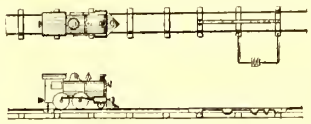


vessels by means of aircraft of the balloon or other type. In the first place, the surface of the upper deck portion of the sunken vessel is covered with a wedge of special pyramidal structure, so that when the balloon or other aircraft is connected with the wreck, as by means of slings, the buoyancy of the balloon may be utilized to greatest advantage. The slanting roof structure reduces the resistance of the body as it is lifted up thru the water.

Electric Semaphore for Autos.

(No. 1,299,361, issued to Hyman Lieberman.)

An electromagnetically operated semaphore for automobile signaling, two of which may be used on the car, one on the right and left, respectively. The device works by

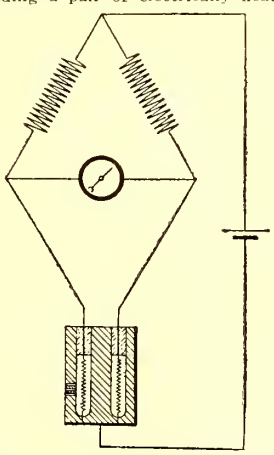


means of a lazy-tongs arrangement connected up to an electromagnet or solenoid. The driver has simply to close the electromagnet circuit with a foot-controlled push-button, when the electromagnet, becoming excited, causes the lazy-tongs to act, thus projecting the hand about two feet. At night the hand may be illuminated by an electric lamp in the palm, which can be seen from either front or rear, and also the fingers can be illuminated by a small electric light placed on each finger.

Electric Whistle for Toy Railroads.

(No. 1,303,117, issued to William C. Roe.)

This invention covers a design for a small electric whistle simulator,

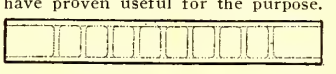


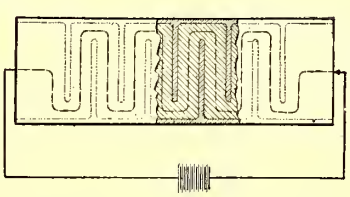
for electric toy railroads. A special circuit controller in the form of an auxiliary track member is provided, in the design here illustrated and described, so that as the locomotive and train pass over this auxiliary contact placed between the rails the whistle simulator circuit will be closed and the device actuated. The instrument is constructed in the form of a buzzer so as to give a high, shrill note, similar to a whistle.

Electric Gas Detector.

(No. 1,304,208, issued to Gilbert A. Shakespear.)

The definite rate of loss of heat from a body exposed to the gaseous mixture is employed as the detecting and measuring agency. A Wheatstone bridge circuit is utilized, including a pair of electrically heated



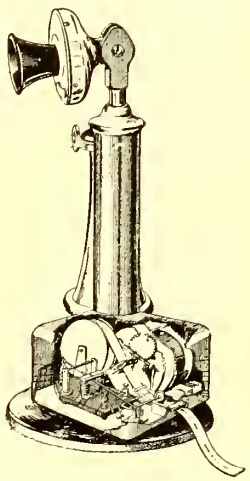


wires, one of which is surrounded by the gas to be tested, while the other is surrounded either by air or by any other gas, which can serve as a "standard" for comparison. A galvanometer is used to adjust the Wheatstone circuits to a state of balance.

Zigzag Carbon Resister.

(No. 1,298,421, issued to John Thomson.)

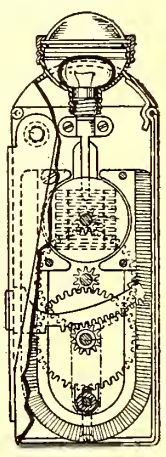
The present resister device renders the carbon element of the resister immune to oxidization, thus restoring the slotted member so as to maintain its original resistance at all times. To do this the slots of the resister are filled with a material having coefficient of expansion and contraction nearly identical to that of the carbon forming the resister. Fuzed aluminum oxid and silicon carbid in its crystalline form have proven useful for the purpose.



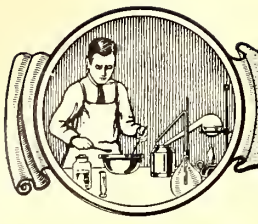
Telephone Call Recorder.

(No. 1,299,154, issued to Arthur Engelberg.)

This invention relates to an electromechanical device comprising a spring motor which will unreel a paper tape, and at the same time, by means of an electromagnet, cause to be recorded on the tape any telephone numbers of parties which may have called while the owner was absent. This device would seem to

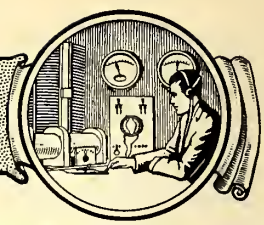


have considerable promise, and if taken up by the telephone companies should prove of great value as a time saver. The spring motor and electromagnetic recording device is controlled from the telephone exchange by "Central." Many times people call a party, only to find "that the line is busy" or else that "they do not answer," all of which wastes a good deal of time in the busy man's day. If the number calling was recorded in the office of the absent party, then upon their return they could call back the number in question.



Magneto Pocket Lamp.

(No. 1,301,595, issued to Marc A. Pattay and Eugène Jaquemont.)



This is a clever idea in magneto electric pocket lamps, and represents several improvements over those heretofore proposed. Not only is it provided with a mechanism for spinning the armature of a small magneto generator, which develops the necessary current for lighting the lamp, by means of a reciprocating rocker arm, but it is also provided with a continuous circular movement crank operated independently and whenever desired by means of a change-over attachment. The device is ingeniously worked out, so that for ordinary lighting purposes it is but necessary to squeeze on the flexible casing of the pocket lamp, which causes the armature of the dynamo to be spun rapidly. No batteries are necessary, and by the arrangement of the mechanism in this lamp it would appear that the light should be practically continuous.

WITH the AMATEURS

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $3.00 each month for the best photos. Address the Editor, "With the Amateurs" Dept.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $3.00 PRIZE WINNER—H. C. SMITH

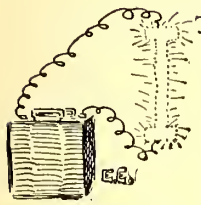
I PRESENT herewith two photos of my laboratory and one of myself. My chemical laboratory has over 150 solid chemicals and about 100 different solutions. The glassware consists of beakers, Erhlenmeyer flasks, funnels, condensers, burettes, hydrometers, evaporating dishes, crucibles, graduates and retorts. It also includes a "French" microscope, a balance, and many other apparata too numerous to mention here. My "Electrical Laboratory" consists of various motors, generators, condensers, wireless transmitting and receiving apparata now in construction, also a switchboard under construction, ½ K.W. transformer coil and a two-inch spark coil. Unfortunately all of my "Electrical Laboratory" did not get into the picture.—H. C. Smith, 3816 S. Honore St., Chicago, Ill.

HONORABLE MENTION (One Year's Subscription to the ELECTRICAL EXPERIMENTER)—ROBERT NIESSNER and ROBERT BOHATY

HEREWITH are several flash-light photographs of the electrical laboratory and experimental machine shop of Robert Niessner and myself. In this laboratory we do all kinds of experimental and research work in chemistry, electricity, high frequency and wireless. This laboratory was started in 1917, and it is still growing very rapidly.

One of the photos (left) shows Robert Niessner, and the other (right) shows myself. Another shows a corner of our "office," where we do all the figuring and correspondence. One of the views illustrates our electrical testing bench and switchboard, and part of our chemical bench. We possess a large screw-cutting lathe on which we do all kinds of machine work. We have had this lathe only a short time and it has turned out quite a few dollars worth of work for us.

These photographs show only a small part of our equipment. We have all kinds of electrical motors, dynamos, generators, gasoline engines, steam engines, electrical testing apparata and a complete set of wood and metal working tools.



Among the magazines that we have in our "office" there is the ELECTRICAL EXPERIMENTER, which is of great value to us in our work. We also have many books pertaining to chemistry, electricity, steam and gasoline engines, et cetera.—Robert Bohaty, 434 East 77th St., New York City, N. Y.

www.americanradiohistory.com

Science in Slang

By EMERSON EASTERLING

IT was an Italian car, the chauffeur was an Italian, and he was delivering long accented discourses in galloping Italian. To be concise, the ignition system had gone on the "fritz" and the wop was "cussin" over the layout. Jazz Stokes and party, we, sat in the tonneau while the driver fingered and swore and smoked Turkish cigarettes.

"The name 'storage battery' is a misnomer," commented Jazz. "The juice is not stored as commonly conceded, but is generated or caused to circulate by the chemical action set up in the plates of the cell."

"How did the storage battery or secondary

Camille Alphonse Faure, Who Pasted Us a Hot One When He Handed Us the First and Original Pasted Gridplate.

cell come about?" asked "Rat" Morehouse, the bow-legged boy from Berkeley, California.

"Volta and Galvani started the ball in that direction when they got to monkeying around in the dynamic field, but the original storage cell was developed by a bird by the name of Planté. Gautherot got to shooting juice thru platinum wires in water and other electrolytes and observed that the little contraption was capable of kicking back a light current when the juice was cut off. The fact of the case was that he stumbled onto the accumulator idea when he was only trying to jerk the H_2O into O and a couple of packages of H. Electrolysis, that was his game. You remember, a lot of the scientists thought that ions was as far down as matter could be boiled—electrolysis did that. Like a lot of other things, the secondary cell was a secondary discovery—the inventor was not fishing for the cell.

"Two years after Gautherot's stunt, in 1803, Ritter constructed a secondary pile much like Volta's. By charging for a few moments with a strong galvanic current the pile would give quite a kick. The plates were copper disks separated by cloths moistened in sal ammoniac.

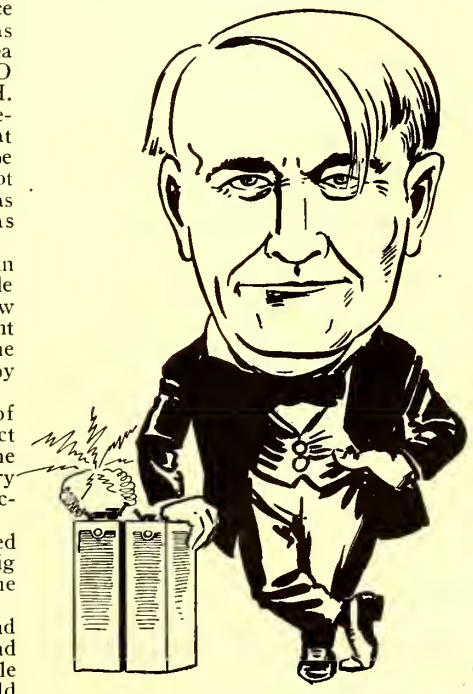
"Count Volta, Bequerel and a stack of other researchers became aware of the fact that gold, silver and platinum and some other nice metals would give secondary currents when subjected to electrolytic action in certain solutions.

"In 1842 Grove slipt us his celebrated gas (no, not mustard) battery. The big idea was the difference in polarity in the two gases, oxygen and hydrogen.

"Mike Faraday had the idea in his hand but did not close up on it when he found that peroxide of lead at the negative pole had a relative high conductivity. The old boy makes note of the fact in his *Researches.*

What Makes the Storage Battery Store?

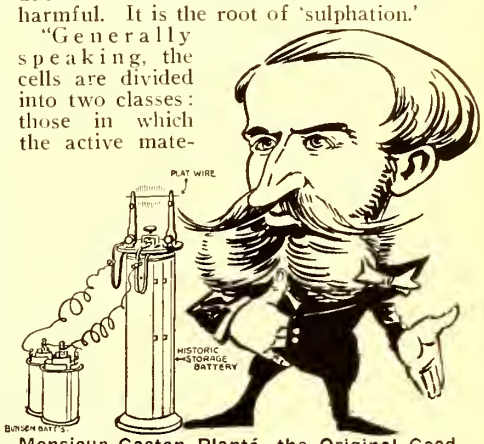
"Until 1860, when Gaston (without the assistance of dear Alfonso) Planté threw a bunch of coiled lead plates together into a jar of solution, the old-timers never had the pleasure of seeing a *real* secondary cell. Gaston, with his plates of lead, lead peroxide and spongy lead, and finally lead sulphate in the sulphuric acid electrolyte, was able to run his battery down to where she took the count and then give her a shot of electric hop and watch her hump again. Metzger, Brush and some of the other highbrows boosted the Planté idea along until they had a fairly decent battery out of it."



"What do you mean by lead, lead peroxide and spongy lead, and finally lead sulphate?" inquired Fred Cochran.

"To begin with, the plates are lead, unless the makers build up the plates from lead oxide and sulphates. The charging current turns the positive plate to peroxide of lead. The negative plate of lead sulphate is converted to spongy lead. The electrolyte is about 23 per cent. sulphuric acid in water. When I said that 'finally lead sulphate,' I was referring to the state that means curtains for the cell. A sulphated cell is like a car without gas or a ship on the rocks. Get the idea?"

"What chemical action goes on in the cell during charge and discharge?" asked Velt.



"It is like this," returned Stokes. "When the juice is sent through the cell, entering at the positive plate, the water is changed to its components, hydrogen and oxygen. The oxygen combines with the positive plate, forming lead oxide or peroxide. The hydrogen forms at the negative plate.

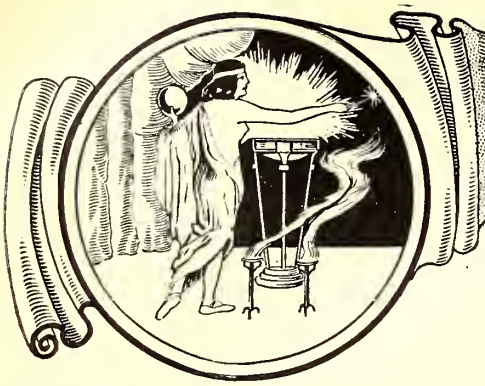
"On disconnecting the source and again closing the circuit, the water is again decomposed. The oxygen uniting with the hydrogen collected at the negative plate and with the plate itself, and the hydrogen uniting with the oxygen of the oxide of lead at the positive plate, causes a current to flow in the circuit that is closed. That is the simple explanation of the operation. There are minor and subsequent actions and reactions that take place, but the only one that makes any difference is the white insoluble sulphate formed by the red or yellow sulphates with the litharge. This formation is a non-conductor and otherwise bothersome and harmful. It is the root of 'sulphation.'

Tommy Edison Stept Off the Lead and Sulphuric Trail and Handed Us the Nickel-Iron Storage Battery.

"Generally speaking, the cells are divided into two classes: those in which the active material is formed by chemical or electro-chemical action, and those in which some easily reducible salt of lead is applied mechanically. Planté types are examples of the former and Faure types of the latter. The Gould batteries are made from the slow former process. The Willard batteries are also of the Planté type, while the Exide cells are of the Faure. The Faure type has a little better output for the weight, but the other has it over on them in sturdiness.

Monsieur Gaston Planté, the Original Goodness-to-Honest Storage Battery Kid.

"Tommy Edison stept off the lead and sulphuric solution train of thought and handed us a new one with nickel and steel and iron plates and a twenty per cent. solution of caustic potash (omiting Perlmutter) for the electrolyte. The electromotive force is not as great as the lead type, but the ampere hours per pound is about half—the bulk being the same, practically, as the old line of cells. Upon discharging, the Edison cell shoves as high as three volts and higher onto the line, but decreases after the load sits on her. You are aware of the fact that the old lead accumulator gives out about two and four-tenths volts at the beginning of the discharge—if you did not know of it before, you do now. The old heavy type has it over on the Edison for constancy of current, but the selling point for the Edison is the lightness and mechanical robustness.



"There are other secondary cells that employ plates of bimetallical composition. The most satisfactory are the *zinc-lead, copper-lead,* and the *copper-zinc,* besides the Edison *nickel-iron* cell.

"Sacramento! Puerco! Blankety Blanko!" And a string of other stuff ending up with the statement that the *"automobile no bono"* and *"a infierno con todos!"* The wop broke in on our discussion—of Jazz's.

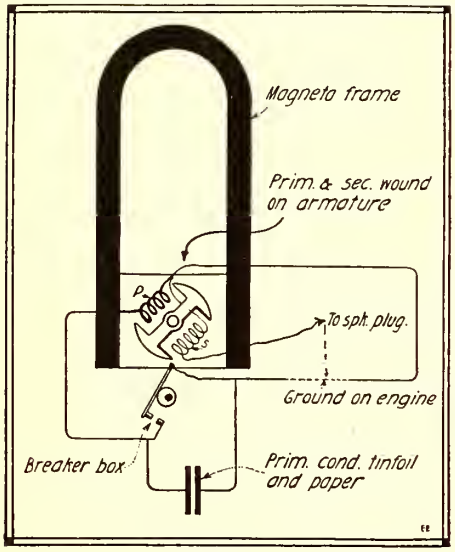
"I guess I will see what is the matter with the motor," said Stokes as he walked around the hood. "I've got a date with a blind man for a game of craps to-night."

In less than five minutes the Italian was saying *"gracias, signor"* and we were leaving a cloud of dust behind us.

www.americanradiohistory.com

THE ORACLE

The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:



1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions addrest to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

MAKING HIGH TENSION MAGNETO FROM LOW TENSION TYPE.

(1016) J. G. Whitfield, Goldsboro, N. C., inquires:

Q. 1. How can I change a low tension magneto into a high tension type?

A. 1. It is rather difficult to change a low tension magneto of the ordinary type into a high tension magneto unless you are quite familiar with the make-up and appa-

How a "Low Tension" Magneto May Be Converted into a "High Tension" Type.

ratus of the latest type machine. We are pleased to give you herewith diagram showing how most of these high tension magnetos operate.

In one of the modern high tension magnetos there are no revolving coils or commutators of any kind, but simply a rotating mass of iron, which is so formed as to cut the magnetic flux in the field many times per second. In this machine the primary and secondary windings are stationary, and undoubtedly you can obtain some information on this machine, as well as other high tension types, which may be of interest to you, by communicating with the various high tension magneto manufacturers.

RADIO ANTENNA QUERY.

(1017) Rolf Carbo, Minneapolis, Minn., asks:

Q. 1. For data on a radio antenna for amateur requirements.

A. 1. Regarding the type of receiving aerial which would be best, should be about 125 feet long, 75 feet high, and at least 4 to 6 wires spaced about three feet apart, which will prove very satisfactory for average long-distance reception and commercial wave lengths.

If you intend receiving amateur wave lengths it will be necessary for you to interpose a variable condenser in your ground circuit.

About the best thing for an all-around set, we advise a small coupler and audion, adapted to a great many ranges of wave lengths. Unless you intend to build a set to receive only undamped wave stations, we would suggest a very large loose coupler.

We refer to our September, 1915, issue of the ELECTRICAL EXPERIMENTER for excellent data on loose couplers.

To Our "Oracle" Friends

Do you realize that not one day passes when we do not receive from 150 to 250 letters addrest to "The Oracle"? If we were to publish all the questions and their answers we would require a monthly magazine five or six times the size of the ELECTRICAL EXPERIMENTER, with no other matter but questions and answers. Of late the influx of letters has become so heavy that several of our associates have been forced to discontinue important editorial work, in order to answer the mail. This we are certain you do not wish. You do not want your magazine to lower its present high standard. You want the best, the very best, and you know we never have failed you yet.

Moreover the multitude of letters are wholly unnecessary. Most of the questions Readers ask every day have been answered before in "The Oracle." Therefore, ere you sit down to write us, look over your back numbers, and nine times out of ten you will find the answer.

We strive hard to publish only such matter as has not appeared before in our columns, and for that reason, only a small fraction of the queries received by us are actually publisht.

Your magazine is steadily coming to the fore as the greatest publication in the scientific world. To keep up its present high standard and to make it a better and bigger magazine requires a tremendous amount of untiring effort on the part of the Editors. Therefore, in the future, we CANNOT in your own interest, answer questions by mail, free of charge.

For questions requiring an immediate answer our fee is 25 cents for the first three ordinary questions, and 25 cents for each additional question. We will gladly advise fee for special questions entailing considerable research work or calculations.

Stamped and addrest envelope should be enclosed with the queries, and moreover, any sketches accompanying them should be drawn in ink on separate sheets. Write plain and, PLEASE, PLEASE BE BRIEF.

Editor of "The Oracle."

STORAGE BATTERY QUERY.

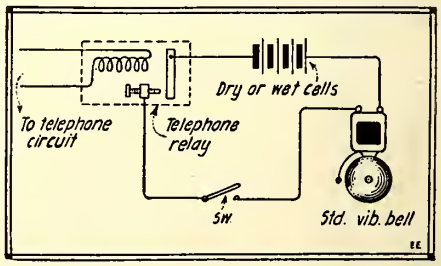
(1018) B. W. Dresser, Homedale, Idaho, asks:—

Q. 1. Several queries on storage batteries, etc.

A. 1. Answering your first question, would advise that water for storage batteries should be distilled and kept in glass containers, as no matter what form of metal you might use, it is only natural that minute particles of the container will mix with the water. It is absolutely necessary for storage batteries, to secure perfect satisfaction from the same, to use pure distilled water absolutely free from any elements which might contain iron or any other metals.

The difference between the current and voltage for static machines and high-tension transformers does not vary very greatly, the designs of the machines and transformers having much to do with their outputs, tho the currents are about practically the same.

It is unnecessary to insulate the conductors of a rotor in a squirrel cage induction rotor. In the usual cases bare solid conductors are merely wedged in the slots of the rotor.



RINGING ALARM BELL FROM TELEPHONE CIRCUIT.

(1019) Theodore Mucha, Terlingua, Tex., writes:

Q. 1. How can I hook up an alarm bell to a regular telephone circuit?

A. 1. With reference to an alarm device for waking up a sleeping person, and to be connected to a telephone circuit, would say that several years ago the Editor installed a very successful form of alarm which will wake the dead.

In order to work this alarm, as the accompanying diagram shows, you will require a telephone relay. This can be pro-

Scheme for Ringing Extension Call Bell from Telephone Station by Means of a Telephone Relay. The Latter Instrument Can Be Obtained from Your Local Telephone Exchange or Supply House.

cured from any supply house at a cost of about $1.00.

The telephone relay is connected directly across the telephone line so that when the current is sent over the circuit, the relay will close the secondary circuit, in which you can connect batteries, electric horn or alarm bell, etc. You can also obtain, if you so desire, a large 6- to 8-inch telephone extension bell, which may be connected across the telephone line.

SAY, what a trick you'll turn for your tongue and taste and temper when you finally get down to bed-rock smokes and let some of that topjoy Prince Albert float into your system! Just will put the quiz into your thinktank as to how much pipe or cigarette-rolling fun you've gone shy on—and, you'll work in a lot of double headers for quite a spell to get all-square!

What's the idea kidding yourself when you know what P. A. will do for your smokespot; when you know what it is doing for men all over the civilized world! You can't hit a happier job than to stock a supply of Prince Albert, jam that joy'us jimmy pipe chuck-full and blaze away! Why, it's like falling into feathers when you've been batting-it-out-on-a-board!

Prince Albert just can't help doing you a clever turn because it won't bite your tongue at any stage! Bite and parch are cut out by our patented process. Want you to know right here, and now, that Prince Albert will be as gentle with your tongue as a toy purr-kitty is with a stuffed mouse! You can rip champeen-smokespeed-records right up the back with P. A. for packing!

You don't need a percentage table to figure out what Prince Albert's quality and flavor and fragrance will do for your happiness every time the clock ticks! You'll get the answer quick! And, now it's your draw! Prince Albert is sold in toppy red bags, tidy red tins, handsome pound and half pound tin humidors, and, in that classy, practical pound crystal glass humidor with sponge-moistener top that keeps the tobacco in such perfect condition!

Solving the Transportation Problem

(*Continued from page* 303)

two main tracks, while a revolving pinion engaged with this rail rack. The train derived its energy from an electric third rail and shoe which operated the electric motor; this in turn worked the pinion.

In Fig. 3 is shown a later type of hydraulic shoe also operated under the water pressure and water suction plan. With this shoe very little water is lost.

100 Miles Per Hour—Safely.

From what has appeared, it will be seen that being that there is no friction, enormous speeds can be obtained with such railways. As a matter of fact one hundred miles an hour is a conservative figure. Nor is it dangerous to run such wheelless gliding trains at such speeds for two reasons. One is that there is no friction. There is no wear and tear of material, and if the flat rail with its guard rails (see Fig. 2) is constructed right, it will be impossible for the shoes to jump the track. And now we come to the most important point as far as the speed is concerned.

These trains it was found could be stopt almost instantly, and *very simply by cutting off the water pressure.* This maneuver brings the hydraulic shoe in direct contact with the rail and an enormous friction sets in. No brakes are needed to stop such a train. *The train is its own brake.* Nor is that all. Such trains can be stopt where *the rails dip at an incline of* 40%, a thing unheard of on regular railways with wheels. You see in a train of this kind there is nothing to roll and the minute the water pressure is taken off, the train must stop at once even at the worst incline. Inversely if the right tractive method is used to propel the train, it will run up almost impossible inclines at angles no regular railroad would ever think of attaining. Furthermore, in view of what has appeared, it will be realized that the cars do not have to be of such ponderous weight as are the present day ones. They can be constructed of aluminum alloy and could weigh one-quarter of the weight of the ordinary car and still be safe.

Former Disadvantages.

There was only one real disadvantage on a railway of this sort. During the winter the formation of ice and snow on the rails tended to put the entire road out of business because no means could be found to do away with the forming ice and its consequent unevenness or roughness of the track. This, however, would not worry our present day engineers for the simple reason that our trains would probably carry some electric heater in front of it, each train thus melting the ice as fast as it formed.

New Ideas by Mr. Gernsback.

We have today a means for propelling the gliding railroad, which is as simple as it is efficient. Our cover illustration as well as Fig. 5 show the means proposed. Fig. 6 also depicts the various methods used. The writer proposes the use of a single track, each car having two hydraulic shoes of the kind shown in Fig. 3. The car is held upright by means of the gyroscope shown. This gyroscope is to be driven by an electric motor and the energy is to be taken from a third rail running alongside the track. This also furnishes the power for the electric lighting system of the train and for the motors which drive the compressors as well as supply the power for the suction pipes. The propulsion of the train is accomplisht as follows:

Electro-Magnets Pull Trains.

The entire track must be supplied with *power (tractive) electro-magnets* sunk or led into the rail which latter should be of some non-magnetic material such as brass or bronze. The power electro-magnets are placed about six inches or so apart and run thru the entire length of the track. Normally these electro-magnets are not energized as will be seen by referring to Fig. 6. When it is desired to start the train, the conductor moves his *magnet-control lever* inside of the car. This lever at the lower end has a contact shoe, which when sliding over the contacts as shown, energizes its particular electro-magnet. In Fig. 6 it will be seen that two of these contact shoes are used. This is done so as not to have any dead points, as otherwise the train could not start. In this figure it will be seen that the rear magnet contact shoe has just closed its contacts, and the rear hydraulic shoe comes now under the influence of the energized magnet. This will tend to pull the rear shoe over the energized magnet. But the instant the pull starts, the train moves along as well and the contact is broken.

The momentum of the train, however, is sufficient to carry it along, and by this time the forward contact shoe will have energized the electro-magnet at the extreme right, shown at Fig. 6. The forward hydraulic shoe now comes under the influence of the energized electro-magnet and the train is pulled forward again. This play is repeated constantly and of course very quickly; within a few seconds the train has obtained a terrific speed. This speed increase can be regulated simply by an arrangement which lifts the electric contact shoe away from the contact rail, and by this means the speed of the train can be

(*Continued on page* 338)

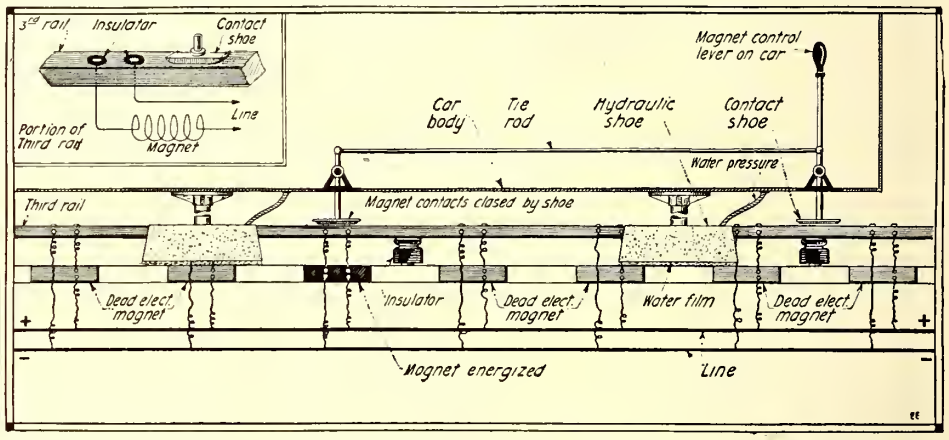

Fig. 6. Showing Mr. Gernsback's Arrangement for Propelling the Train by Means of Electro-Magnets. As the Train Moves One Electro-Magnet Is Energized at a Time, Which Exerts Its Traction on One of the Shoes, Thus Pulling the Train Along. Insert Shows Method of Making Contact with Power-Magnets.

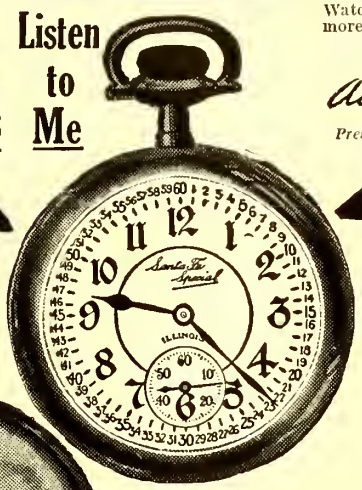
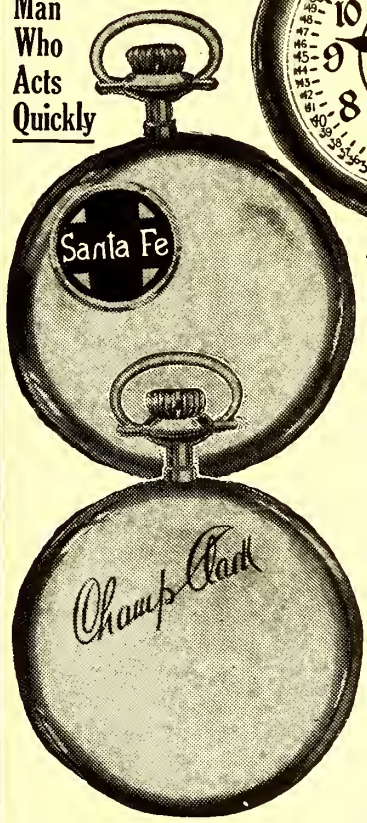
Pres. Alonzo S. Thomas, Santa Fe Watch Co.

LISTEN MEN!



I HAVE determined to make 1919 the banner year in the Watch Sales of my Company. To do this I must distribute 5,000 "Santa Fe Specials" to 5,000 men in different communities this year. I must do this REGARDLESS OF PRICE OR PROFIT. Therefore, I have Cut the Price of these 5,000 Watches to ABSOLUTELY ROCK BOTTOM. This means that if you act at once you can get one of these Guaranteed Watches on this CUT-PROFIT PLAN, and pay for it in small monthly installments. MY OBJECT:—I know that every Watch sold on this Cut-Profit Plan will sell at least one more at the regular price, so I make this STARTLING, UNHEARD OF OFFER to men who will tell their friends of this remarkable Watch Value, if they find the Watches all and more than I claim for them.

Signed,



Alonzo S. Thomas

Pres. Santa Fe Watch Co.

Listen to Me

For the Man Who Acts Quickly

I SAY

Unless you already own a Watch that you are sure is just as good as they make them, this is a money-saving opportunity you positively cannot afford to miss. It is a Bargain such as you do not meet every day. For that reason you will have to act promptly or this allotment of 5,000 Watches may all be gone before you get yours. To make sure you get one, suppose you write me personally, care Santa Fe Watch Co., right NOW before you forget it. I want you to join my **"5,000 Watch Club"** and carry one of these beautiful Standard "Santa Fe Special" watches.

21 Perfect Jewels
Adjusted to Positions
Adjusted to Temperature
Adjusted to Isochronism
Adjusted to the Second
Thin Model
All Sizes

The ILLINOIS Famous Santa Fe Special 21 JEWEL RAILROAD WATCH $2.50 A MONTH

"Santa Fe Specials" are Standard Railroad Watches, **Guaranteed to Last a Lifetime and Give Satisfactory Service.** Are found in the pockets of men in service on the important railroads of this country. Senators, Congressmen and Governors keep their official appointments by "Santa Fe Special" time. Army Officers and Privates carried them all through the Greatest War in history—thousands of these splendid Watches are in use all over the World. If you want one on my liberal CUT-PROFIT PLAN you had better write for my Free Watch Book today and make your selection without delay. I will send the Watch for you to see WITHOUT ONE PENNY DOWN—I will even allow you to wear the Watch 30 days FREE—then sell it to you on a binding money-back guarantee.

THINK OF IT!

A Standard Watch at a Saving of ⅓ to ½ of Your Money. That is exactly what this wonderful offer means, and it is exactly what you get, **if you are so fortunate as to get your order in in time to get one of these 5,000 "Santa Fe Specials" on my Special Distribution Cut-Profit Plan.** The coupon, a letter or your name and address on a postal will bring my Free Watch Book right back to you. Don't delay—write today.

NEW CASE DESIGNS

I want you to see the newest designs in Cases used on these "Santa Fe Special" Watches, so that you will fully realize their beauty and up-to-dateness, as well as the value of the Bargain I am offering you. I want you to see the 3-color inlay work—nothing more refined. Then think how distinctive and personal **your Watch** would be with your own name, monogram or some appropriate emblem engraved in the Case, just to suit your own ideas. You will also want to see the new French Art designs in engraved Cases—all shown in **My New Watch Book,** printed in beautiful colors. Write for it today, it will be sent FREE.

SANTA FE WATCH CO.

Tropical Climates Make No Difference with the "Santa Fe Special"—Four Seconds in Five Months.

I feel it my duty to let you know how my "Santa Fe Special" is standing the tropics. It is the best watch I have ever carried, with no exception. It has not lost over four seconds since I received it, about six months ago, comparing it with Naval time. I wouldn't sell it for $50.00 and take chances of buying another make half as good.

B. H. GABBARD, Tutuila, Samoa.

I received the watch and think it is one of the finest pieces of work I have ever had. I am pleased very much with it.

A. RATHOFF,
U. S. S. Jupiter, Atlantic Squadron.

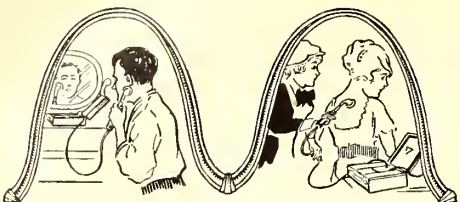
Likes It Better Than a Watch that Costs $85.00.

I find my watch to be the best timepiece I ever owned. I owned an $85 watch before, which was stolen from me, and to tell you the truth, I can see no difference, so far as keeping good time is concerned, between it and my "Santa Fe Special." The "Santa Fe Special" comes up to the mark of efficiency in every respect. I put her through some severe tests this winter, and she hasn't lost or gained a second yet, as far as I know. If anyone knows the value of a good timekeeper, it is we people here in the Coast Artillery Service. The watch is worth more than you ask for it in my estimation.

FRANOIR L. WALLOW,
Cpl. First Company, C. A. C.,
Fort McKinley, Maine.

A Watch to be Proud of.

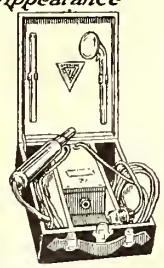
Received the "Santa Fe Special" watch today, and am more than pleased with it. I must say that the engraving is the best workmanship I ever saw, and I know I have a watch now that I can be proud of.



J. C. FAHNING, U. S. S. Washington.

Says It's Worth Sixty Dollars.

I want to say that the watch which you sent me is far above what I expected for the money. A friend of mine with a $50.00 Hamilton, almost new, offered me his watch and $10.00 for my "Santa Fe Special." A local jeweler tells me that my watch ought to have cost me $60.00.



T. E. DAVIS, Hurlburt, N. Mex.

Solving the Transportation Problem

By H. Gernsback

(*Continued from page* 336)

regulated to a nicety. In order to overcome the difficulty of starting the train with a bad jerk, it is in the power of the conductor to move the contact shoe forward or back, for a few inches. Thus the hydraulic shoes can be brought under the gradual pull of the electro-magnets by being a greater distance away from the energized magnets as shown in Fig. 6. For, the further the hydraulic shoe is away from the electro-magnet, the less the tractive effect will be.

In the writer's system, the train is stopt the same as by the French method, simply by withdrawing the water pressure. The hydraulic shoe then comes into contact with the track and the train stops almost immediately.

System Not Expensive

It will be argued that this magnet arrangement is a very expensive method, but this is not the case. These railroads are not intended for great distances, but will be mostly used in cities where first cost is of no consequence. Witness for instance the truly enormous cost of subway construction where the cost per mile frequently runs into millions of dollars. In the electro-magnet tractive scheme, like in all other railroads, it is only the first cost that counts, and it is very much doubted if the idea advanced here will make this railroad cost even one-quarter as much per mile as an ordinary elevated railway.

Another important plan which the writer advances, and which is shown impressively on our cover illustration, is that this railway is not intended to run thru the streets, *but rather over the house tops.* This is quite practical with such a railroad for the following reasons: Firstly, the single track will take away practically no light where it crosses over the streets. The track can be very light because the cars themselves are light. Also, there is but a single track, and consequently the structure that carries it can be exceedingly light. Secondly, there is no noise whatsoever. You cannot hear the coming or going of the gliding wheelless trains. They make absolutely no noise and *there is moreover no vibration.* The pillars supporting the track can be placed on two adjoining house walls as shown in our cover illustration; therefore no foundations are required. Stations can be located on the roof tops if desired, where they will not be as unsightly as at present. Elevators will take the passengers up and down.

Being that these railroads can be run safely at a speed double or triple the present day ones, it should be possible to provide a seat for everyone, no matter what the increase of the population will be. We cannot transport in the future many more people than our present day transportation facilities provide. Airplanes are out of the question for obvious reasons and so are airships for the reason that they cannot be operated quickly enough, and also they cannot carry enough passengers no matter what their size. Take for instance a New York Subway car when packed full will accommodate often as many as two hundred passengers, while a ten car train carries two thousand souls. From this it can be seen that neither the airplanes nor the airship can ever hope to compete with the wheelless trains as outlined above.

How to Develop Your Inventive Ability

By Jay G. Hobson

(*Continued from page* 330)

ters, steps in line, picks up his tray and proceeds to obtain his knife, fork, spoon and paper napkin. Directly ahead of him is a man with dirty face and hands who also fumbles around among the silverware probably touching our friend's knife and fork as well as his own. Our friend notices this and frowns, but sees nothing of importance about it other than the unsanitary annoyance for the time being.

At five-thirty P. M. we return to our friend's office and find him all prepared to drive home in his eight cylinder flyer; so feeling the need of fresh air we invite ourselves to go along. We haven't gone far until it begins to rain in torrents, but we don't bother as the top is up. Arriving home our friend turns into the driveway and as he nears the garage observes both doors tightly closed which means that he must get out into the wet to open them and that's no joke. He simply jumps out, gets wet and mutters things we can't record here.

Our friend's wife meets him at the door with the usual welcome and he feels greatly relieved amid the comforts of his cozy little home. Supper is served with our friend enjoying a good meal. During dessert his wife expresses her great desire to see a certain good play at the opera. Husband frowns inwardly for it is his preference to keep within the shelter of his home this wet evening. But observing his wife's earnest desire for additional amusement he strives to show some enthusiasm over the suggestion. They leave for the show about seven-thirty.

Arriving at the theater thirty minutes later they enter, taking their wraps with them to their seats. Past experience with the check room service has convinced them of this wisdom. The theater is crowded, every seat is occupied. There is no empty seat near them to lay their hot wraps on. Our friend must hold the collection upon his lap which doesn't add to his comfort. Along about the third act when the exciting part of the play makes everyone sit rigid with expectation, our friend is simply sweltering under the many woolen garments over his knees but he just sits there and suffers without one idea concerning the uncomfortable situation.

Returning home after the show our friend finds a telegram waiting for him. It is from headquarters instructing him to make a special business trip up-state to a city that he has never visited before. He prepares for the trip and leaves the following morning. But before leaving he acknowledges the company's wire and at the same time requests them to send him an expense check.

While en route to his destination he takes the hotel directory from the Pullman Library and selects what appears to be the best hotel in the city. He proceeds to this hotel and registers as usual. The following day the company's check arrives

$1.00 INEXPENSIVE ELECTRIC POWER $1.00

The wonder of the twentieth century inexpensive electric power, this is possible with our new electric power system, a new idea in electricity. With the aid of our instruction and chemicals you can make and install a power battery as shown in the illustration, absolutely safe and simple. **Stop wasting money** on buying batteries, install the new electric power battery. It is not an acid or dry battery, it is a new combination of wet and dry elements which produce electricity. These batteries are **powerful and cheap** to operate, they produce a direct current of more than 10 volts, cheaper than any other form of battery. They are wonderful for operating all kinds of experimental work, for lighting purposes and for many other uses where electric current is needed. Any user of batteries knows the value of an inexpensive high voltage electric current. These batteries should be in every home, office, shop and factory, no matter how small a current is needed; to reduce or raise the current of the battery, simply move the volt regulator on the switch board. The beauty of these power batteries is, that they do not evaporate or lose current when not in use, therefore, with every day use recharging the battery is necessary about every month or so, it can be recharged at home in a few minutes, **no electricity or machinery is required** for this operation, recharging material can usually be obtained around your home or can be bought for a few cents. These batteries when charged weigh about 34 pounds and if properly installed **will last for years.** Each battery making outfit consists of a completely wired switch board, battery connectors, wire, instructions and plan for making, installing and recharging the battery and complete chemicals. **Special introductory price, $1.00, prepaid.** Outside the U. S., $1.25.

NEW MODEL TELEPHONES $2.00

The most useful and inexpensive wall telephones yet developed. Good use can be found for a set of these telephones in many homes, and in office, store or shop, indoors and outdoors; they save many steps and much time. You can easily install these new model telephones and have your own private line with no operators to bother or listen to your conversation. They are thoroughly practical and serviceable all around telephones. Their construction is simple and neat, nothing to break or to get out of order, a child can operate them with ease, they will give satisfactory service at any distance up to 1500 feet, and even at that distance the voice will be perfectly plain and understandable as with the **regular commercial telephone.** These new model telephones are electrically operated, two batteries will operate a set of phones for a long time, the cabinets are made of polished oak and finished with a durable varnish and fitted with excellent receivers and transmitters, fine workmanship and construction throughout, **guaranteed to operate** under all conditions. We are offering the New Model Telephones at an **exceptionally low price.** Each telephone set consists of two New Model Telephones, calling system, wire, instructions and diagram for installing. **Special price to introduce $2.00, prepaid.** Outside the U. S. $2.25. **FREE**—We want every reader to own a New Model Telephone set, so we are going to give away a **2-cell battery FREE** to every purchaser of a New Model Telephone Set.

ELECTRIC LIGHT IN YOUR HOME $1.00

The latest electric light, no batteries to buy or electric bills to pay. Anyone can install and maintain this midget electric light. Safe, simple and inexpensive. No more smoke and smell, no wicks or oil, no chimneys to clean or break, just as safe in the barn, garage and clothes closet as in any open room, always ready for use, day or night. A touch on the switch and you instantly have a **bright electric light.** No matter where you live this light can be installed. It is not affected by heat or cold. Many homes have installed this electric light in their halls, closets, pantries, barns, sheds, cellars, garages, etc., with good results. It is an extremely useful light which no household should be without. The reason for this bright electric light is that the lighting bulb is fitted with a drawn Tungsten filament wire which is much more efficient and durable, besides giving a **300% increase in light** as compared with the ordinary carbon lamp. The power system furnished with this lighting outfit is somewhat similar to the electric power battery described above. Each electric light outfit includes the following: Complete directions and plans, copper wire, insulated wire holders, knife switch, drop light fixture with socket, friction tape, battery protector, maroon shade, national mazda globe. Our dry battery compound, which assists in renewing and supplying the current and our current renewing system with which you can **renew the current at home without expense.** With every day use one recharge usually lasts two to three weeks. This electric lighting outfit is undoubtedly the most practical and durable electric light of low cost and long service ever devised. **Special price to introduce these electric lighting outfits $1.00, prepaid.** Outside the U. S. $1.25.

Our Guarantee—It is our intention that every article described above will reach you exactly as described, that it will satisfy you perfectly, that it represents full value for the money you paid or we will refund your money.

Just to introduce our new line of goods we are offering them at these greatly reduced prices. We only have a limited number of the above described goods at these prices. **Order now,** direct from this ad. We guarantee safe delivery anywhere for additional 10 cents on each item.

How to Develop Your Inventive Ability

By Jay G. Hobson

(*Continued from page* 338)

as requested. Being a total stranger in the city he asks the hotel manager to kindly cash said check, explaining who he is and the integrity of his superiors.

The manager very diplomatically explains that he has often heard of his fine company and would be pleased to accommodate him if he will just have some one identify him so that he can be sure our friend is the proper person. For it is possible, from the manager's point of view, that our friend could have found the check—that had happened before! Of course, the hotel does not mean to doubt our friend's honesty for one moment!

Turning around he rams the check deep into his pocket with a vow, to himself, that he will get that check cashed by the first bank he comes to.

Walking slowly down the main business street he runs into a friendly looking bank and he decides to try his luck in there. Approaching the cashier's window deliberately he shoves the check for a hundred toward the cashier with the remark that he would appreciate the favor. The cashier excuses himself for a minute and retires to one of the financial reference books for information about the company.

Promptly returning to his money cage the cashier politely informs our friend that he would be pleased to favor him if he will obtain additional identifications. Our friend is almost desperate by this time and requests the cashier to take him to the president of the bank. The president is courteous but assumes the same stand about further identification as the others. Our friend's spirits dropt very low from this last retort. But glancing down on the expensive mahogany desk of the president he accidentally observed the national emblem of an organization to which both he and the president belong and quickly makes this known. The president's face softened and after a few hand shakes the cashier is summoned with instructions to honor our friend's check which was accomplished among expressions of appreciation.

Now shifting our minds into reverse we will return to our friend's first experience in the cafeteria and see what, if any, improvement was suggested by things that transpired. This simple little test of observation will help to show how far your inventive abilities have been developed. The more observing mind would have received an idea of value after seeing that man with dirty hands mussing over the silverware. A mental picture of a sanitary dispensing machine for knives, forks and spoons would have appeared. A machine with levers to operate the dispensing of the silverware so that only one pair of hands would touch the silverware to be used by them. This would be an improvement of worth.

The incident at the garage should have suggested a device to automatically open the doors as soon as the automobile came near enough to put it into motion. Possibly a small electric motor attached to the doors with a bumper switch to come into contact with the front tires of the auto. After the small motor had propelled the doors sufficiently to allow the auto to enter, there would be a cut-off switch on the end of the door that would stop the motor.

Then at the theater our friend's discomfort should have suggested an improvement in seats. One with a clothes compartment in the back that would open when the seat was bent forward and close and disappear thru the floor when the seat was pushed backward.

www.americanradiohistory.com

Being check-bound away from home in a strange city without anyone to identify you is no joke, for I speak from experience.

The trained observer's mind would have pictured a device in the form of a small pocket case with his picture in one side and across the picture would be signed his official signature. In the other side would be secured a cancelled company's check bearing his signature, the stamps of the different banks and clearing houses it has past thru on its way back to the company; and on its face it is marked PAID. This old check would be compared to the new one. The signature on the picture and on the old check and on the hotel register would be compared together, which would be all the identity necessary to obtain the money needed.

A few months ago I was visiting friends in the evening. They owned a popular phonograph that they played for hours each evening and fully enjoyed every moment of it. This particular evening that I called they refrained from playing even as much as one short record, and I could not quite understand the unusual situation. Being by nature somewhat nosey about unusual conditions I inquired of the cause for their abstinence. The husband frankly confest that he had neglected to stop by the music store for a very important accessory necessary for proper playing of their instrument. This explained, I exprest my regret but immediately an idea flashed thru my mind that there was a great need for a small device to make this important accessory.

For weeks I kept turning that spark of an idea over in my mind trying to picture a machine that would be satisfactory for the purpose desired. Finally I pictured it in detail and soon constructed a working model that proved efficient. Then I applied for broad patents both in the U. S. A. and foreign countries. It is about ready for the market now, but in justice to the manufacturers it isn't possible to explain definitely all about the construction and origination until ready for public announcement. However in a later article I shall show several drawings and give a complete explanation of the invention.

Bomb Expert Eagan

(*Continued from page 296*)

use among the Italians. These bombs were made by Italians who had been employed in fireworks factories in Italy and in America. The cause for the placing of the bombs was feuds among the Italians. A section of the city became known as the "bomb centre."

While walking in a section of the east-side on a fair May day, in the neighborhood of East 11th and 12th Streets, I was stopped by a policeman from the East 5th Street Police Station House. "I was just up to the station house and sent a call for you," he said. "Why?" I queried. He answered, "We have located a big package down in 11th Street, which looks like a bomb, and the people in the house have left their apartments, fearing it will explode."

Upon arriving, I ordered all the children away from the place, and then started to operate upon the bundle. To my great surprise I came upon *two fulminate of mercury caps attached to two fuses, and twelve sticks of 40 per cent. dynamite put up in two separate packages!* To each six sticks of dynamite, a fulminate cap was attached. The bundle was surrounded on all sides with heavy pieces of iron, bolts and small pieces of slugs. It was then covered with burlap, which in turn was covered with newspaper and bound with

Why Not Earn $35.00 to $100 A Week

As A Mechanical Draftsman?

"Get into the profession of big pay and Rapid Advancement with the help of the school that has started hundreds on the Road to Success. I am ready to help you." Roy C. Claflin, President, Columbia School of Drafting.

Learn At Home In Spare Time

You don't have to stop work or leave home in order to become a trained Draftsman. Through our practical home study Training we will teach you Right in Your Own Home so that you will soon be able to qualify for a good position at Big Pay. We will continue to instruct and help you until we know you have the knowledge necessary to succeed.

No Previous Training Necessary

Right now—TODAY—there are openings for thousands of Draftsmen in the Government Departments, industrial concerns, and the big engineering offices. One department alone recently called for 1,800 draftsmen. With this tremendous demand has come a big increase in salaries.

Draftsmen Are Getting $35 to $100 a Week

with big chances for even better pay as the demand grows. By enrolling NOW for our practical Home Study Course in Drafting you can quickly qualify for a position as Draftsman and by properly applying the principles we teach.

You Have a Chance to Become a Chief Draftsman

and get to the very top in this fascinating profession. Our course will give you just the knowledge you need to make good as chief draftsman when your chance comes.

Peace Calls For More Draftsmen

With the problems of reconstruction facing the nation the demand for draftsmen is even Greater Than During the War. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. You can help in the work of reconstruction and secure a Big Salary with excellent opportunities for advancement. Prepare now and be ready when the demand reaches its height.

We Will Help You Secure a Position

as soon as you complete our course. We have already placed hundreds of our graduates in good paying positions and are constantly in touch with vacancies for which Draftsmen are Urgently Needed. Government Departments and Private Concerns are continually calling upon us for our graduates because they know that our instruction produces draftsmen of the caliber they need.

Thousands of Men Wanted Right Now

Drawing Outfit FREE

As soon as you enroll you will be sent our special drawing outfit FREE so that you will be sure to have it to work with while taking the course. This set will be yours to keep. You are not asked to return it after completing the course.

Illustrated Book of Particulars Sent Free

Fill in the coupon below—send it to us and we will send you FREE a copy of our illustrated book telling all about our practical Home Study Course and how you may secure our instruction at once on Easy Terms so as to quickly qualify for one of the Big Positions Now Open.

Mail This Coupon To-day

a heavy wire. In all, the bomb weighed about thirty pounds.

With the development and common knowledge of explosives of the nitro-cellulose group, chlorat and nitrat mixtures disappeared and the number of composite nitro-cellulose and nitro-glycerin bombs has increased and many ingenious combinations of the above mentioned methods of ignition have been devised, showing that much keener minds and men well trained in chemistry and the use of explosives have made these later type bombs.

Speaking of Large Bombs.

The first bomb of this type, the "Cunard Bomb," discovered in 1902, was the largest bomb I ever handled. This type was very rare then, but it is now "the usual garden variety." The Cunard bomb was of the nitro-glycerin class mechanically detonated. The bomb consisted of 100 lbs. of 60 per cent, dynamite, placed in two boxes, each containing 50 pounds. These boxes were set inside a larger box within which was set a *timing device* which would set off the fulminating caps and detonate the explosives. The timing device was set to explode when the ship had proceeded two hundred miles from the coast. The man who made the bomb was discovered in a tenement and was found to be insane.

The O. K. Bottling Works Bomb was of the nitro-cellulose type, mechanically and electrically operated, as was evident from the circumstances, weight and size of container, the express charge and the debris. On the morning of December 12th, 1913, a small pasteboard box was delivered by the Adams Express Company and was received by the stenographer, Miss Anna Amusewitz, who laid it aside until she had opened the mail. The bookkeeper who was in the office when the bomb exploded and who survived his injuries, stated that Miss Amusewitz cut the string, thereupon an explosion occurred. The office was wrecked, Miss Amusewitz was hurled into the corner and died within ten minutes. The perpetrator was never discovered.

The Herrara Bomb was of the nitro-glycerin group, chemically ignited. The circumstances were similar to those of the O. K. Bottling Works Bomb, which killed Miss Amusewitz. Mrs. Herrara was killed outright and her husband was totally blinded.

The Taylor Bomb, the second manufactured by Klotz, was of the same type and made by the same person. This bomb killed Mrs. Taylor under the same attendant circumstances as noted above.

My own fingers were blown off by a bomb of the same description and manufactured by the same man who sent it to a prominent man in New York City, (Judge Rosalsky), related Inspector Eagan.

Shortly after the third bomb, Herman Klotz, a draftsman and former employee of the City of New York, was mortally injured by a bomb he was making. Klotz confest to these outrages before his death in the Fordham Hospital.

Since the beginning of the European War, bombs have been of an improved type and are modelled along the lines of munitions used by the European Belligerents.

The Fay Bomb manufactured by Lieutenant Commander Fay, of the German Imperial Navy, was of the alkaline metallic nitrat and chlorat type, mechanically detonated. The bomb case was of steel plates welded together by 100 rivets, and a riveted cover with a water-tight gasket. The interior was filled with a chlorat, nitrat, sulfur and antimony mixture. There were two detonating devices, one within the steel case and the other one the exterior. The exterior mechanism was attached to the propeller shaft of the steamship and the rotation of the shaft tightened the spring on the interior me-

www.americanradiohistory.com

chanism so that when the spring automatically released, it tript the firing pin which exploded the percussion cap, thus detonating the chemical mixture.

The Recent "Gimbel Bros." Bomb.

The late nation-wide Post-Office Bombs were composite bombs of the nitro-glycerin, alkalin, metallic, chlorat type, manually, mechanically and chemically ignited, and were the work of a trained, experienced expert, who knew chemistry, explosives and the psychology of his victims. These nineteen bombs were similar in composition, but not in operation, to the bomb which killed Governor Steunenberg of Idaho. See photo of bomb.

The latest bomb outrages known as the "Anarchist Fighter's Bombs" were of the *high explosive* type. The details cannot be divulged at this time, but the destruction surrounding the residences where the bombs were set off tells the tale all too well.

There are many foolish bomb scares—from diamond studded wrist watches, sent without notice, to one of the Four Hundred's latest debutantes, to a piece of copper ore sent to a mining engineer or a new kind of cheese sent to a prominent patron of the Waldorf-Astoria, who is a connoisseur of famous cheeses, or it may

***INSPECTOR OWEN EAGAN** holds perhaps one of the most unique positions in the world. Mr. Eagan is the official bomb opener in New York City, where during the last decade more bomb outrages have been perpetrated than in any other community in the world. Mr. Eagan has consented to publish some of his experiences in the columns of the ELECTRICAL EXPERIMENTER, and we feel certain that every reader will be intensely interested in Mr. Eagan's experiences. Inspector Eagan has opened thousands of bombs in his past career, only once being injured, when he lost a finger of his left hand due to the premature explosion of a bomb.*

be a box of coals containing a ticking alarm clock which has been sent to the Italian barber in the corner barber shop. These jokes cause much worry and excitement and should never be perpetrated. In one case I found a woman in a serious condition, due to the receipt by messenger of a package the inner wrapper of which was decorated by skull and bones and a warning of death. Arriving there and removing this cover, I extracted a bottle of plain "Pluto Water"!

The latest bombs were not the only ones sent to prominent persons.

Carnegie Mansion at Ninety-first Street and 5th Avenue was the scene of a bomb discovery. Another bomb was discovered outside the offices of the Italian Consul at 212 Lafayette Street. These were of the nitro-glycerin class, manually ignited by the application of a match to the fuse.

The late Honorable Mayor Gaynor was the recipient of a similar bomb which was discovered outside his office window with three burnt matches, and a piece of Chinese lighting punk which showed evidence of having been ignited.

The wealthy and prominent persons of our city are not the only victims to have these unreliable and unexpected packages sent to them. Two bombs were placed in churches in this city. Two bombs were placed in moving picture houses on the East Side. One bomb tore away the stairway and gallery. Even tenements suffer as much as mansions and private residences.

Bomb-Making An Unhealthy Vocation.

The "bomb maker" is not particular where he manufactures his infernal ma-

Try This Interesting Experiment

It is something *everybody* can do.

It is something you *must* do, if you would ever be more than a drudge.

It will bring you freedom from worry.

It will make you happy, and independent.

It is wonderful insurance.

It puts you where you can grasp opportunity when it comes along.

It gives you a vacation when you need it.

It means more advantages for your children.

It denotes character and stability.

It puts you out of debt.

It is the beginning of Success.

Try it.

It is—*SAVING!*

It is now made easy by a new system, and interesting.

Almost as fascinating as a game.

It is the Budget System of Saving and Making Money.

You have read about it in the magazine and newspapers.

All authorities endorse it.

It stops you from slipshod spending.

It saves the money that now slips through your fingers—puts it where it will do you some good when you need it.

Thousands of happy, successful families use it today.

It is fast becoming universal among worth-while people.

A business principle applied to the home—that's what the Budget System is.

It shows you in advance the minimum amount you can save.

A Chicago family beat their Budget by $65.00 last January.

That's getting ahead.

You can do the same.

You have always *intended* to save more.

You have worried about the high cost of living.

You have wondered where all your money went to.

Take that last $50.00 you spent.

What have you got to show for it?

How much of it can you account for?

Can't you account for *all* of it?

No?

Then you are a reckless spender.

Just such methods keep millions poor.

They cause hand-to-mouth living—and destitute old age.

The Budget System corrects this evil.

But learn the Budget System correctly at the start.

It's so simple.

An accountant named Palmer devised a wonderful Budget Book—

based on seven years' actual experience in the home.

It tells you all about starting a Budget—and how to keep it up.

Then there are pages to last you two years.

By Palmer's System it only takes you a few moments each day.

A grammar school child can do it.

It is all in one handy volume—well bound,

convenient,

handsome.

You'll be proud to show it to your friends.

But prouder still to enjoy the advantages it brings to you and those dear to you.

You won't be without this wealth-creating book if you see it.

We want to send it to you *at our expense.*

You don't even need to send postage.

Merely mail the coupon.

We send the book—all charges prepaid.

You keep it five days.

Quickly you will see that it will pay for itself several hundred times.

You will see why users are so enthusiastic about it.

You will want to keep it.

No matter whether your income is steady or variable.

No matter what season of the year.

You will never be without Palmer's Household Money Maker if you see it.

That's why we make such a liberal offer.

Keep it five days.

Then send us the purchase price—

only three dollars.

Think what a trifling sum this is.

It is less than half a cent a day, as the book lasts two years.

Read the letters in this ad.

They are pouring into our office every day.

You, yourself, are likely to write us a letter that will appear on this very page.

But the first step is to send the coupon.

DO IT TODAY!

The quicker you get Palmer's book the quicker it begins to save you money.

ACT NOW!

KRIEBEL & CO., 643 Home Insurance Bldg., Chicago.

Users Are Enthusiastic

I am wild about this book, the one I should have had long ago.
T. B., Watertown, Fla

I kept tab on house expense for 6 years, when I told my folks it averaged $40.00 a week they just laughed at me. We are 10 in the family. Taking the book home I told one of my daughters to put everything down from January 1st to date, when we closed the month of January it amounted to $174.79. It surprised them all. I am sure I can save what I paid for the book in a week; don't need to wait two years as it is an eye-opener to the folks at home. Be sure and send me another book in December, 1920.
R. K., Odebolt, Ia.

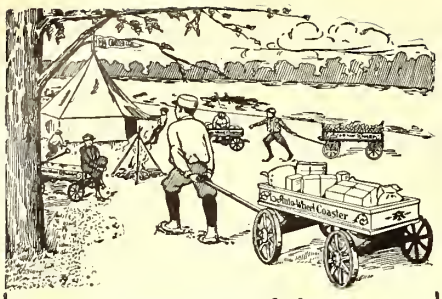
I am very much pleased with same. Enclosed please find money order to pay for two copies of this great book, kindly send me another copy by parcel post as I desire to turn same over to a close friend
D. O. R., Frankfort, Ky.

Will you please accept this check and forward one copy of this book? I have seen a copy of this book and it is just the article I've been looking for for the past year or so.
W. L. F., Alexandria, La.

I gave the book to a friend of mine for a wedding present and if I am not mistaken it will prove the most valuable present I could have given him. Kindly send me another of these books for my own use.
W. G. V., Kansas City, Mo.

Attached herewith you will find check in payment of your account against me, and for the balance request that you mail your Household Money Saver to the following four parties.
A. E. K., Cleveland, O.

KRIEBEL & CO., 643 Home Insurance Bldg., Chicago.



You may send me Mr. Palmer's book, prepaid. Within five days after receiving it I will send you $3, or mail the book back to you.

NAME .....

ADDRESS .....

For the convenience of those who wish to remit cash with order, we allow a cash discount of 25 cents, making the price of the book $2.75. If you remit cash with order you may keep the book five days, then return it if you do not want it, and we will refund your money.

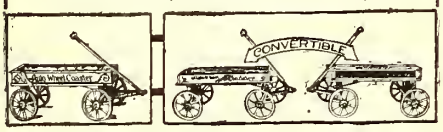
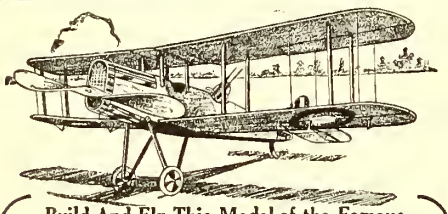
Adventures of the
Auto-Wheel Coaster *Club*

HOW THE AUTO-WHEEL HELPS AT CAMP.



——First the long hike, with the Auto-Wheels carrying the heavy loads—tents, and chow, and fishing tackle, and all the rest



——And when we pitched camp the Auto-Wheels did a man-sized job hauling away rubbish from the camp area, and bringing up firewood. Jim, the Club Captain, bossed the job, and camp was ready in forty minutes.

——We all wore our Club caps—the kind all Auto-Wheel Club members get free by writing to the Buffalo Sled Company for details.

BOYS: If you want to share the fun of the Auto-Wheel Coaster Club, write for booklet showing Auto-Wheel Coaster and Auto-Wheel Convertible Roadster. *A Free Felt Pennant* goes with this handsome booklet.

THE BUFFALO SLED CO., 163 Schenck Street, In Canada: Preston, Ont. N. Tonawanda, N. Y.

Build And Fly This Model of the Famous

DE HAVILLAND DeH-4
BATTLE PLANE

Here's a new IDEAL Model Aeroplane—a faithful duplicate of the war-famous Battle Plane that downed the enemy over the battlefields of France. This new IDEAL Model is in every detail a practical, 3-ft. copy of the original. Has oval aluminum radiator, veneer cockpit and fuselage, aluminum top and bottom engine cowling, hand carved propeller, ball-bearing propeller shaft and rubber-tired disc wheels. Guaranteed to fly from the ground. Miniature gun mount and guns can be made and mounted on the rear cockpit. Build one; it's easy! IDEAL Accurate Scale Drawings, including building and flying instructions, show any bright boy how to do it.

chine. A cellar in an East Side tenement, the laboratory of a prominent hospital, an abandoned shack in the marshy sections of the suburbs, the servant's room of the mansion, a suite in the most modern apartment house, perhaps in the next apartment wherever you may be living. *Bombs, strange as it may seem, have been made by many types of men, in all degrees of education, wealth and state of life.*

In the bomb factory in the rear of a quiet and prosperous barber shop, the proprietor was killed by an explosion and upon the examination of his body, a little carelessness in placing a too highly reactive chemical in his pocket was found to have caused the end of his career. This rear room contained enough chemicals to stock a small drug store, sufficient dynamite to clear Long Island of tree stumps and enough modern fire arms and ammunition to make envious a "would-be" Jesse James.

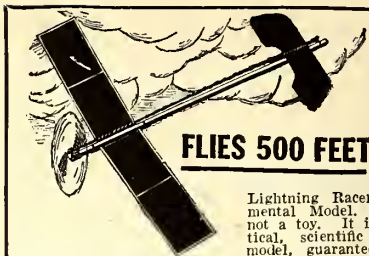
The making or setting of bombs is not a safe and lucrative occupation or hobby, as many of these men meet destruction by their own bombs. The greatest death toll paid by bomb makers occurred in the top floor of a six-story apartment house on Lexington Avenue, between 102nd and 103rd Street. Three anarchists, Hansen, Carron and Berg were killed. A brother of Louis Berger, who used a fictitious name "Murphy," escaped death with severe injuries. The force of the explosion destroyed the three upper stories of this building.

During the war I was kept busy with the routine work of the Fire Department cooperating with the Police, Federal authorities, Defense authorities and in the instruction of agents who were assigned to the investigation of various enemy activities. The signing of the armistice brought its train of trouble with shells, rifle and hand grenades, fuses and every imaginable war relic which contained explosives. Many fingers were torn off by grenades exploding in the hands of children."

Mr. Eagan Only "Official Bomb Opener."

At this point we ventured the question: "How many men are engaged in this kind of work, Mr. Eagan?"

Mr. Eagan's answer is illuminating: "The only official bomb opener other than my own unique position, was the Imperial Chief Inspector of the late Czar of Russia, who held an exalted place in court circles and received a fabulous salary. I am one of the hard working, loyal American citizens in the Civil Service of this City, accepting an humble salary and have secured my position by long and trying experience, constant study and research."



To the question: "How did you engage in this mysterious and dangerous work?" Eagan's answer is to be found in the indomitable spirit of his race.

"As a boy, my Mother would relate to me the mysteries of Cleena, the Fairy Queen of County Cork, Ireland, whose invisible palace was on my great grandfather's estate near Fermoy. The spirit of delving into the occult and mysterious was early developed and not lacking the necessary nerve and grit, I went to it."

The telephone bell rang. "Another bomb," laconically said the inspector.

"Here's my card. Ring, if you get a package," were his last words as he dived into the express elevator. I looked at his card. This is what it says:

OWEN EAGAN.
BOMB EXPERT.
Fire Headquarters. Worth 4100.

FLIES 500 FEET

Lightning Racer Experimental Model. This is not a toy. U. S. S. TENNESSEE ELECTRIC DRIVEN.

The U. S. super-dreadnaught Tennessee is a sister ship of the California, now being built at the navy yard, Mare Island, Cal., and which is to be launched in the fall. The Tennessee is 624 feet long, 97 feet 5¾ inches in width, and has a draft of 30 feet 6 inches. She displaces 32,600 tons and has a speed of 21 knots. She has eight water tube boilers and a fuel capacity of 1,900 tons. Her armament will consist of twelve 14-inch guns, fourteen 5-inch guns, four 6-pounders, four anti-aircraft guns, and two torpedo tubes. She will be manned by a crew of 58 officers and 1,024 men. She will burn oil exclusively and will be equipt with electric drive.

Man's Greatest Curse--Infected Teeth

(*Continued from page* 301)

"Tooth infection is undoubtedly transmitted from person to person in the same family, from parents to children, by means of kissing, the use of common drinking and eating utensils, and many other ways. So, if one has infected teeth, he is not only dangerous to himself, *but may transmit this infection to other members of his family, especially his children,* and produce serious conditions which are difficult to explain. One is appalled at the condition of the first teeth of children, many of whom have to have their first teeth filled. Often the second teeth become infected from the first set and the child carries thru life the result of the neglect of the teeth, on the one hand, and the transmission of the parent's infection, in addition.

"Consequently, we feel justified in advocating radical measures in eliminating the infection from children as well as adults, and that means extracting all infected teeth, whether in children or adults, as soon as there is evidence of infection.

Conditions Resulting from Infected Teeth.

"As we give further attention to the subject of chronic infection of the teeth, we are finding more and more conditions resulting therefrom. At first, *the relation of infected teeth to rheumatism* was demonstrated by Hastings in 1914. This was a very important discovery, for this disease had baffled physicians who could find no definite cause for it and many fanciful theories were put forward to explain the cause. *Not only can rheumatism be prevented by intelligent care of the teeth,* as outlined above, *but in many cases it can be cured by the simple method of extracting infected teeth.* Possibly the most common ailment of people in general today is summed up in the general term 'stomach trouble,' and often this condition resists all attempts at eradication by the ordinary methods and may persist for years, causing the patient to drag out a miserable existence. In the majority of cases, infected teeth are at the root of the trouble, and if the condition has not progrest too far, extraction of those teeth, so fondly cherished for years, may clear up the chronic stomach trouble.

"We have proven conclusively that the infection of the teeth, after years, may spread to other organs of the body and cause disease in these remote regions, which disease has apparently no relation to the teeth, but, nevertheless, the infected teeth are directly responsible for the condition. The bacteria which grow and propagate

(*Continued on page* 347)

Make a Bigger Income Learn Draftsmanship

Great demand for draftsmen now. Still greater demand in prospect. War over, building is to be resumed and manufacturing to expand to meet home and foreign needs—which means plenty of good positions for draftsmen. Take up this paying profession. The Chicago "Tech" method is the quickest, easiest way to become a draftsman in spare time while you hold your present position. That proved before you pay a penny. (See free lesson offer below.) Send coupon. Learn how to earn

$25 to $100 a Week or More

at interesting work with opportunities to rise to superintendent, manager, or other executive positions. Let the Chicago "Tech" engineers train you At least get the free lesson and information.

Drawing Outfit

(No Extra Charge)

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives this drawing outfit—set of instruments in case, drawing board, T square, triangles, scale, curve, drawing paper, pencils, etc., or a cash credit in case he already has an outfit. You use them while learning.—then take them right into your practical work.

NOTE: Enrolled with Chicago "Tech" you have the personal direction of practical engineers, builders and architects who teach you the methods they use in their own work. No useless theories, no time wasted. You are prepared to stand beside old, experienced men. Big advantage to learn from a staff like this—every man a specialist.

Come To the College or TRAIN at HOME

Wherever you are you can have this Chicago "Tech" training. Complete instruction by mail. Exercises, lessons, personal direction of our experts right in your own home if you cannot come to the college for a resident course. Send the coupon and get the facts.

Auto and Gas Engine Course

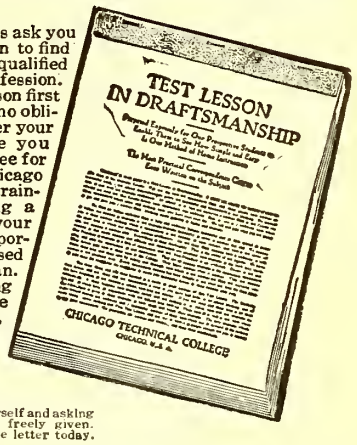
All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Splendid opportunities open now.

Learn All This in Spare Time

All about the Principles of the Automobile.
All about Gasoline Engines.
All about Power Plants and Transmissions.
All about Carburetors and Fuel Supply Systems.
All about Lubrication and Cooling.
All about Batteries.
All about Magneto Ignition.
All about Starting and Lighting Systems.

Know How To Fix Troubles

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.



Write Send the coupon and get catalog and all information now.

Easy Payments

The fees for Chicago "Tech" courses are very moderate—and you can pay on easy terms. And also—you can obtain in a few months what it would take several years to acquire by ordinary methods. You can get an early start. You are soon ready to take a paying position and to quickly get back the cost of your course.

FREE TEST LESSON

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man. The coupon will bring all the facts about the course, the small fee, and the easy terms.

Mark with X the branch you are interested in--or if in doubt about which course to take, write a letter stating facts about yourself and asking our advice which will be freely given. Mail either the coupon or the letter today.

FOR EXPERIMENTERS ONLY!!

WE have in the past held many extraordinary sales, but we believe that the present one eclipses all by the wonderful values we are offering. The goods which we offer on this page are all standard telephone apparatus. Every piece we are offering is equipment that for one reason or another was discontinued by the telephone companies. If you wanted to buy any of the pieces which we offer herewith, from the manufacturers, the price would at least be ten times what we are asking for it. You can readily ascertain this for yourself by looking over our wonderful prices.

RUSH

Cut out and attach to your order. It will leave us within 24 Hours.

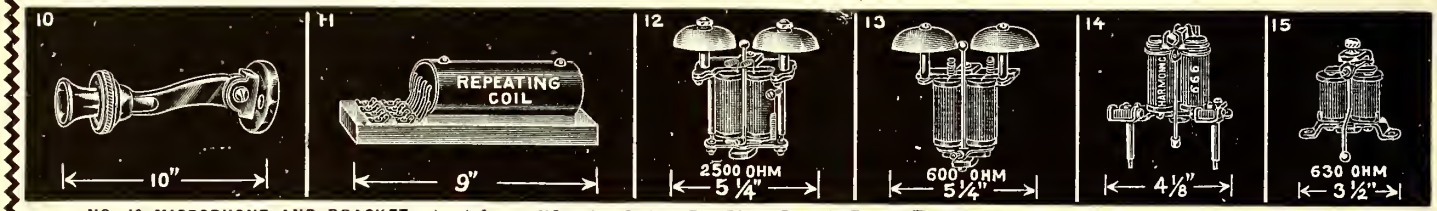
We have bought a large block of these goods and have a large quantity of every item on hand. Immediate shipment can be made on all of the goods in practically any quantity within reason. *Shipment within twenty-four hours* will be made if you use the adjoining coupon. This coupon saves you several days and your order will then be considered a rush order. We guarantee every piece to be as represented, and we will refund the money if goods are not exactly as claimed by us.

No. 1 TELEPHONE RELAY, 1500 ohms—has two silver-contact springs and is very sensitive. Can be used wherever a sensitive relay is needed. It is adjustable and can be used for a variety of purposes.
No. 1 Relay—shipping weight, 2 lbs. Price..... **$1.50**

NO. 2 STANDARD TELEPHONE Induction Coil, primary 1 ohm, secondary 55 ohms. Used wherever you need a good induction coil. Has primary and secondary and iron wire core; fibre heads.
No. 2 Induction Coil as described—shipping weight, 2 lbs. Price..... **$0.50**

NO. 3 STANDARD RESISTANCE wound with German silver wire—4,500 ohms, can be used as a choke or plain resistance, and has many other uses that readily suggest themselves to the experimenter.
No. 3 Standard Resistance as described—shipping weight, 4 oz. Price..... **$0.40**

NO. 4 HORSESHOE MAGNET, size 3¼ inches wide x 5 inches high. Will lift about 1 lb. Quality euch as used on magnetos, which means the best.
No. 4 Horseshoe Magnet — shipping weight, 2 lbs. Price..... **$0.30**



NO. 5 REPEATING COIL (Transformer). This is a standard small repeating coil and is used by all telephone companies. It has 4 different windings and eight contacts. Entirely enclosed in iron. The resistance being respectively 72 and 120 ohms, and 90 and 100 ohms. Diagram is furnished. Can be used for wireless, for boosting signals, etc.
No. 5 Repeating Coil—shipping weight, 2 lbs. Price..... **$0.50**

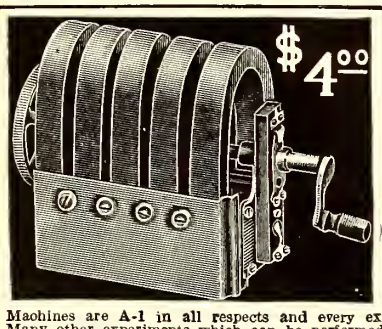
NO. 6 ½ M.F. CONDENSER. This is a standard telephone condenser and has ½ microfarads. Condenser comes in neat metal casing. This condenser is used in connection with spark coils to absorb the vibrator spark. Invaluable for test buzzers to absorb spark and make the sound of buzzer more steady. Is also used by every experimenter in connection with wireless where a fixed capacity is needed. Several of these condensers should be in every experimenter's laboratory.
No. 6 Condenser, ½ M.F.—shipping weight, 1 lb. Price..... **$0.50**

NO. 7 DOUBLE POLE BELL TELEPHONE RECEIVER—hard rubber casing with 4 ft. cord and tips. Standard 75 ohms—very powerful magnets. This receiver can be used in connection with any ordinary telephone work, and you will even find it sensitive enough for short distance wireless work.
No. 7 Bell Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.80**

NO. 8 STANDARD TELEPHONE RECEIVER with Metal Head. This receiver is made by Stromberg Carlson Co., with genuine hard rubber handle and ear cap. A very good fool-proof as well as sensitive receiver that cannot be put out of order if you try. Used for the same purpose as No. 7 Telephone Receiver.
No. 8 Standard Telephone Receiver—shipping weight, 3 lbs. Price..... **$0.75**

No. 9 IMPEDANCE COIL (Close Core Transformer). This is a very fine little transformer and is used extensively in connection with telephone work. It is in reality an A.C. transformer for which you would pay $5.00 if you had it made to order. The primary has 0.15 ohms, secondary 2000 ohms. It can be used for a variety of purposes that will suggest themselves to every experimenter. Can be used successfully to boost wireless signals. Also in connection with audions, etc. An A-1 instrument. Size 3 x 3 inches.
No. 9 Impedance Coil—shipping weight, 2 lbs. Price..... **$0.65**

NO. 10 MICROPHONE AND BRACKET. An A-1 sensitive microphone of the carbon grain type. Has hard rubber mouthpiece and enamel steel bracket, the instrument being 10 inches long. This microphone, in connection with our No. 7 or 8 Receiver, will constitute a complete telephone outfit, good to speak 50 miles or more, at a remarkably low price.
No. 10 Microphone and Bracket—shipping weight, 5 lbs. Price..... **$1.00**



NO. 11 REPEATING COIL (Transformer). A standard repeating coil used for telephonic work. The coil windings are encased in an iron tube 2¼ inches in diameter. There are eight terminals for the four windings to connect to and the instrument is invaluable in connection with radio work to boost up eignals, audion work, etc. Many interesting uses will be found for this coil. Resistances are: 100, 120, 145, 175 ohms.
No. 11 Repeating Coil—shipping weight, 8 lbs. Price..... **$2.00**

NO. 12 POLARIZED RINGER with Bells. The resistance of the two coils is 1250 ohms each. The armature is perfectly adjustable. Bell will work on any magneto. We also furnish blue print with ringer showing how *a first class polarized relay* can be made by anyone using only a few pieces of metal and screws.
No. 12 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.50**

NO. 13 POLARIZED RINGER with Bells. This is the eame kind of ringer as the No. 12, except that it is not adjustable and that the resistance is less. First class in all respects. Blue print furnished with this to *make polarized relay* same as with No. 12. Solenoids on this ringer are worth more than the price we ask for the entire ringer, and do not forget a powerful magnet that goes with it.
No. 13 Polarized Ringer with Bells—shipping weight, 2 lbs. Price..... **$1.00**

NO. 14 HARMONIC RINGER. This ringer is also polarized and has a powerful magnet. It works on 66.6 cycles and any magneto will operate it if run at a certain speed. A very finely built instrument. Resistance of each coil being 200 ohme. Can be converted into a polarized relay by substituting a very fine leaf spring instead of the heavy one furnished. A most interesting instrument with which to experiment.
No. 14 Harmonic Ringer — shipping weight, 4 lbs. Price..... **$1.60**

NO. 15 RINGER without Bells—630 ohms. This also is a polarized ringer and has an adjustable armature. The adjustment is done by means of the top screw. A beautiful little instrument. With this instrument, too, we furnish a blue print showing how a *polarized relay can be built.* You should have several of these beautiful little instruments. They are worth their weight in gold; the powerful magnet alone being worth more than the price we ask for the entire instrument.
No. 15 Ringer—shipping weight, 2 lbs. Price..... **$0.80**

No. 55 5-bar magneto, 110 Volt A. C. Generator

This is one of the most powerful magnetos ever built, when manufacturers could afford to put good stuff into them; equipt with transmission, make and break, etc. Transmission wheels are all brass, crank handle furnished. This magncto, as well as the other ones listed below, will light a 110-volt lamp merely by turning the crank handle slowly. While this magneto gives alternating current only, it can be rewound so it will light up a number of four, six and 10-volt lamps, all depending upon the thickness of the wire you wind on the armature. As we furnish these magnetos, they will give a powerful alternating current and you will not be able to stand the current when grasping hold of the terminals. This makes an ideal shocking machine. All our generators can be transformed into a direct current machine by equipping it with a home-made commutator. Machines are **A-1** in all respects and every experimenter should have one of them in his shop. Many other experiments which can be performed with this machine will readily suggest themselves to any experimenter. The magnets furnished with these generators are very powerful, each one being able to lift one pound easily.

NO. 55 5-BAR MAGNETO GENERATOR as described—shipping weight, 25 lbs. Price..... **$4.00**

NO. 33 3-BAR GENERATOR, same as described above except that it has only 3 bars, and is somewhat emaller.
No. 33 3-bar Generator—shipping weight, 10 lbs. Price..... **$2.00**

NO. 44 4-BAR GENERATOR, same as No. 55 except that it has 4 bars, and is somewhat smaller.
No. 44 4-bar Generator—shipping weight, 15 lbs. Price..... **$3.00**

NO. 66 6-BAR GENERATOR, same as No. 55 except that it has one more magnet and the armature is somewhat larger and more powerful. This is the biggest type made and is extremely powerful.
No. 66 6-bar Generator—shipping weight, 30 lbs. Price..... **$4.50**

Complete Wall Set

This is a complete commercial telephone station. The cabinet is of polished oak, piano finish, within which is contained the powerful magneto, the 300 Ohm polarized ringer, and induction coil. The magneto is exceptionally efficient, being of the two bar type with brass gear transmission. The extra sensitive microphone, mouthpiece and two gongs are mounted on the front of the cabinet, giving the entire instrument that desirable appearance of compactness and efficiency. Guaranteed to work over 20 miles. The telephone receiver is a double poled one, and has a hard rubber case. Seven binding posts are provided for connections. The instrument is one which we can offer with pride to our patrons at a ridiculously low price. It is unobtainable anywhere else at less than $15.00 and is an instrument unequaled in value for the price we ask. Size over all 11" x 10" x 8". Shipping weight, 15 lbs.
No. 26 Long Distance Telephone Set..... **$8.00**

CARBON GRAIN TRANSMITTER

A special design of transmitter for long distance work. Is used on wireless telephone sets where a steady current of ¾ to 1 ampere is constantly required. Sizes over all 3¼ x 2½ inches. Shipping weight, 3 lbs. **No. 6080 Carbon Grain Transmitter as described..... $1.00**

"The Livest Catalog in America"

Our big, new electrical cyclopedia No. 20 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 176 Big Pages, 400 illustrations, 300 instruments and apparatus, etc. Big **"Treatise on Wireless Telegraphy."** 20 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. FREE Cyclopedia No. 20 measure 7x5¼". Weight ½ lb. Beautiful stiff covers.

Man's Greatest Curse--Infected Teeth

(*Continued from page* 345)

at the roots of infected teeth must have an outlet, especially if the tooth has been crowned and all means of drainage from the upper part of the tooth is thereby cut off. *Then the bacteria filter thru the bone in which the teeth are embedded, which bone is microscopically porous, and from the organisms or bacteria gain access to the lymphatic system and migrate to other organs and set up a secondary focus of infection.* When this condition occurs, it is easy to understand that the mere extraction of the offending tooth will not clear up the condition but the infection must then be eradicated from this new focus.

"We have various methods of locating these secondary *foci* of infection. If the tonsils are infected as a result of infected teeth, *the teeth should first be extracted and then the tonsils removed.* If the stomach is infected, an examination of the contents will show the presence of this infection and it can be treated by means of vaccines, but always *after* the infected teeth are extracted. In the more serious conditions the *intestinal tract* may be the seat of the *secondary infection* and, by means of the X-ray certain things relating to the function of the intestines may be found and intelligent surgical aid may have to be invoked.

Three X-Ray Views of Infected Teeth. The Two Right-hand Radiographs Show Abscesses Indicated by Arrows: The Dark Patches In the Left-hand Radiograph Indicate Abscesses. This Photo Was Taken Down Thru the Top of the Mouth, the Patient Holding the Plate in the Mouth Between the Teeth.

"There can be no doubt that many unexplained diseases have their origin in infected teeth. Thus Barker, at the Johns Hopkins Hospital, has shown that many cases of *pernicious anemia* have recovered when the infected teeth are extracted. It has also been shown that *serious heart conditions, diseases of the kidneys*—commonly known as 'Bright's Disease'—*diseases of the gall bladder* and many other diseases may be the result, directly or indirectly, *of a focus of infection originating in the teeth.*

Nervous and Mental Diseases Due to Infection

"Finally, the most serious result of infected teeth is to be found in the relation of this infection to *nervous and mental conditions.* We have been for years groping in the dark, trying to find a cause for these unexplainable conditions. We have considered mental diseases as something apart from general diseases where such things as worry, grief, fear, overwork, and many other elements are usually given as the cause of disease of the mind. Since we have found at the State Hospital at Trenton *that many of the patients suffering from mental disease had also very serious chronic infections of the teeth, tonsils, and gastro-intestinal tract,* and that by **eliminating these infections our patients recovered,** we are justified in concluding *that these chronic infections play a very important role in the causation of the mental condition.* Of course, other factors, such as we have mentioned, have a profound effect in lowering the vitality and allowing a latent infection to become active.

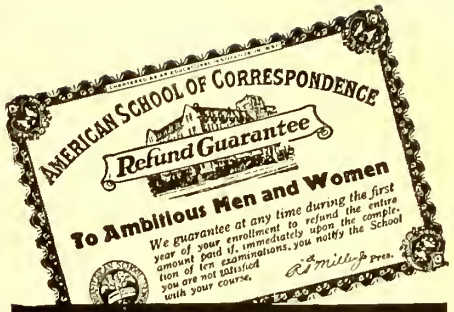
"By recognizing the fact that mental diseases may be the result of infection and the toxemia or poisoning due to this infection, we have been able to restore many patients, who with our former methods of treatment, became chronic patients and remained in the hospital until the time of their death. *Thus we have been able to discharge 87 per cent. of the patients admitted to the hospital in the last nine months, whereas for a period of ten years, the proportion of discharges to admissions was only 43 per cent.* In other words, we have *doubled* the number of patients who leave the hospital as a direct result of our researches.

"As a prevention of mental diseases, then, it would seem that the proper care of the teeth is of the utmost importance, and we would emphasize the fact that the proper care is entirely different from what the usual dental examination reveals, *and that only by refusing to have devitalized teeth* (teeth in which the nerve has been destroyed), *crowned, or otherwise preserved, and insisting upon having these teeth extracted, can we hope for better teeth and prevent infection, which later will have serious consequences.* This is a matter which can be controlled by the individual and it is the public in general who can bring about a better state of affairs by insisting upon good dentistry, in the sense we have explained, and by not allowing the kind of dental work which preserves the teeth to the detriment of the patient's health. Such results as we are trying to obtain can only be brought about by educating the public in these matters, as well as the medical and dental profession. For this reason we believe that the widest publicity should be given to these facts and their importance emphasized both from the standpoint of prevention and cure.

CONCLUSIONS.

"We feel justified in summing up the results of modern scientific medical and dental investigations as follows:

1. That bad or infected teeth are extremely prevalent and because they cause no symptoms to the patient are often unrecognized.



2. That these same infected teeth may be the source of many serious and often fatal diseases, including nervous and mental diseases.

3. That the only known prevention of the effects of this infection is to have all devitalized teeth removed as well as the teeth known to be infected.

4. That one should not allow devitalized teeth to be capt or crowned nor pivot teeth to be placed on old roots but insist that these teeth be extracted.

5. That all persons should keep in mind the danger of transmitting this infection to other members of their families, especially children, and thus prevent serious trouble in after years.

6. That while the infection may originate in the teeth, in the course of years this infection will travel thru the lymphatic system and invade other organs, and eventually set up secondary foci of infection, which become more dangerous than the original focus in the teeth."

Find Out What TRAINING Means to YOU

What it Has Done Intensive training has qualified men like YOU for the positions they wanted—given them steady employment—made them sought after by employers—multiplied their earning power—made them leaders in their chosen lines. For thousands, it has changed the drudgery of "getting by" into the joy of GETTING ON. Do you realize that the *same* intensive training can do the same for you?

Why it Does it Doing things better than the other fellow—thinking and acting for yourself—having a grip on your task—the expert touch—the trick of KNOWING HOW—that is why you succeed after intensive training. *That is what it does for you.* Training clears away the cobwebs, throws the spotlight on the things you don't know about your work, and makes you the master of any emergency.

Don't Fool Yourself

Don't be fooled into thinking that "luck" or "pull" will make you a winner. The man without training just scrambles through life—never a money-maker—never sure of his job—never holding a responsible position. As long as you refuse to train you must pass up opportunities and make way for the man who does. Face the facts and then let the American School help you into a better position—the one you want—as it has helped its thousands of students.

You Take No Risk

The American School's guarantee above means that you can test what training will do for you without risking one cent of your money. We've got to make good with you, so check and mail the Coupon—NOW—for Free Bulletin.

Save TIRES LIKE THESE

I Earned $2200 In Four Months

This is Richard A. Oldham

Mr. Oldham was tel graph operator for the Illinois Central Railroad for twenty years. He is fifty-eight years old. One day he read one of my advertisements and the possibilities of making money in Auto Tire Surgery business. In a few weeks he had purchased and installed a Haywood outfit. A short time afterward he wrote us that his income in four months was as much as it had been in Two and One-Half Years as Telegraph Operator.

Be a TIRE SURGEON

Make $2,500 to $4,000 Per Year Giving New Life to Old Tires

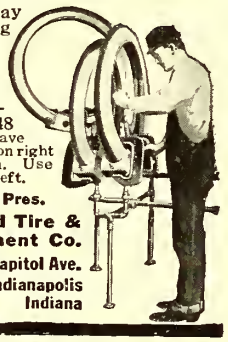
A Haywood Tire Surgeon can do more with old tires than was even dreamed before the war. By the **Haywood Method a Haywood Tire Surgeon** can give 4,000 to 5,000 more miles of new life to a tire that two years ago would have been thrown on the junk pile. And it's easy to learn.

HAYWOOD'S TIRE SURGERY

Stations are Needed Everywhere

20,000,000 tires wearing down every day. By Tire Surgery you can quickly repair, rebuild and give new life to tires seemingly all worn out. Cuts, gashes, tears, bruises, broken fabric, every kind of an accident that can happen to any tire, inside or out, you can repair and save for long service. **The chance to make money is simply wonderful.**

$2,500 to $4,000 a Year is Possible



If we told you all the truth you wouldn't believe it. You would say, "it is too good to be true." But you can see what a great field there is for **Haywood Tire Surgery Stations**—for this better way.

WITH THIS HAYWOOD OUTFIT

Send Today for My Free Book

WRITE TODAY

I have ready to mail you the day I get your request, a fascinating book—all about tires—how to repair them by the Haywood Method—how to start in business—how to build up trade—what to charge. In 48 to 72 hours you can have the whole proposition right in front of you. Use coupon at the left.

M. HAYWOOD, President
HAYWOOD TIRE & EQUIPMENT CO.
1210 Capitol Ave. Indianapolis, Ind.

DEAR SIR: Please send me by return mail your free book on the new Haywood Tire Surgery Method and the details of your free school of tire repairing.

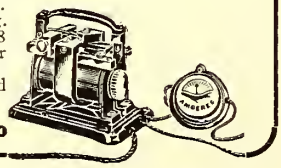
HOME BATTERY CHARGING



means vitality and long life to your battery and anyone can do it with the

NEW F-F BANTAM BATTERY BOOSTER

which will fully charge any 6 volt storage battery eF-Ficiently from 100 to 130 volt 60 cycle alternating current lamp socket.

This is a new size of F-F Rectifier and similar to our standard F-F Magnetic Rectifier which has been on the market for over 3 years. Thousands in use giving satisfactory service. Simple, safe, sure acting. Copper and carbon electrodes rectify the current. Capacity 6 volts 8 amperes. Shipping weight 10 pounds. Price complete with Ammeter and Battery Clips $15.

Send check for prompt shipment via express or if via parcel post add sufficient for postage and insurance. Bulletin 12 on request.

THE FRANCE MANUFACTURING CO., Cleveland, Ohio

Says the Master Mechanic. The Greb Automatic Grip Puller is a One-Man Puller—Quick-acting, strong and simple in the extreme. May be locked in any desired position. A combination of two or three arms. Heavy Duty Size capacity 1" to 18"—Junior size capacity 1" to 7". Two sets of jaws furnished with each size.

Ten Days' Trial If your dealer or jobber does not have them we will send you one. Try it ten days. If not satisfactory, return to us and we will refund your money. We also make the GREB RIM TNOL.

The "Torpedoplane" and "Sub" Spotter

By George Holmes

(*Continued from page* 306)

called because of its weakness for laying eggs in other people's nests—is one further testimony to British engineering ability and the resourcefulness of our navy.

Rear Admiral Bradley A. Fiske, U. S. N., conceived the idea of a torpedo-carrying airplane in the winter of 1910-1911 as a means of defending the Philippine Islands, and discust the idea with the General Board of the Navy. In April, 1912, he applied for patent on the torpedoplane, which was granted in July, 1912, by the U. S. Patent Office.

The Italians were the first to make experiments in dropping weights from an airplane, with a view to evolving a method of launching torpedoes. Captain Alessandro Guidoni, Royal Italian Navy, using a 1910 Farman biplane equipt with floats, made a number of experiments at an Italian naval base in 1912-1915.

Captain M. F. Sueter, who was then director of the air department of the British Admiralty, appreciated the value of the idea and in conformity with the practise of the British Navy, which provides that the name of the commanding officer shall appear on a patent application with the name of the author of the invention, a patent application was made in the joint names of Captain Sueter and Lieutenant Hyde Thomson, in March, 1914.

The sinking of a Turkish troopship while at anchor in the Sea of Marmora, in 1915, by a British torpedoplane, created a little more interest in the experiment, but no greater support was given to the work and the experiments were superficial in nature and dragged on slowly, due to lack of official interest.

In May, 1917, those who believed in the potentiality of the torpedoplane and hoped that the Allies would put this device into effect against the German Navy before Germany could build torpedoplanes, were made heartsick by the report that the British steamship *Gena* had been torpedoed by a *German torpedoplane*.

In connection with the above, it is stated by the Admiralty that this method of attack was first practised successfully in August, 1915, by R. N. A. S. pilots, who sank several ships in the Dardanelles by torpedoes from seaplanes.

How the Torpedoes Are Carried.

A sketch of one of the German seaplanes that participated in the attack against the *Gena*, showing the pontoon arrangement for holding the torpedo in the German seaplane, is exactly like the arrangement on Admiral Fiske's torpedoplane. The torpedo is held between the two pontoons of the seaplane with a bracing to keep the torpedo from moving while the seaplane is flying.

Some years ago I had occasion to discuss, first with Admiral Fiske and then with Allied officers, the advisability of using *automatic brakes* to check the velocity or fall of the torpedo. This discussion led to considering a number of methods, such as lowering the torpedo by means of a cable. But it was realized that while it would be feasible to lower the torpedo several hundred feet by means of a cable, and its direction could be maintained by means of vanes, and the possible swerving of the torpedo might also be checked by means of vanes, which would hold the torpedo steady excepting in case of sudden turns, the advantages to be gained were not readily apparent. The giant naval seaplane NC-4, which crost the Atlantic, could easily carry two full-size torpedoes.

www.americanradiohistory.com

One Hundred Miles an Hour Torpedo Boat!

Some of the transatlantic planes being designed at present are capable of covering 3,000 miles without stopping. These machines can be converted into torpedoplanes by merely attaching the torpedoes under their planes or at some other convenient place. And then they become flying torpedo boats, capable of cruising at a speed of 100 to 125 miles an hour or more. A crew of half a dozen men will be sufficient to operate such a torpedoplane. Imagine this marvellous combination of speed, potentiality and mobility! What better weapon can we find for the defense of our coasts and island possessions? An enemy fleet bent on attack or carrying an invading force would have to contend with large torpedoplanes before it could come within 1,000 miles of our shores and with smaller torpedoplanes launched from aerodrome ships, such as are recommended by Admiral Rodman.

Admiral Fiske's "Sub" Spotter.

A patent was recently issued to Admiral Fiske on a clever submarine localizer.

As the illustration shows the aircraft, plane or dirigible tows a super-sensitive sub-sea microphone thru the water by means of a float or else an armed boat, which may serve to give battle to the enemy, should he arise to the surface. Suspended from the boat is a sound-detecting microphone connected by circuit wires carried by a cable to a battery and telephone receiver in the car of the airship.

The operation is as follows: When a submarine is under water, power is supplied from her storage battery to an electric motor, whereby the submarine is driven. The continuous whirring sound made by the motor while in operation transmitted thru the water affects the microphone so that this sound is heard and recognized in the telephone receiver by an observer in the airship car, listening thereat.

Being thus apprised of the location of the submarine, the observer may transmit that information to a station ashore, or to a vessel afloat, by any known means—as, for example, by visible signals or by radiotelegraphy.

In order to enable the observer to convey information as to the speed and direction of the submarine, the sea area to be protected may be mapt in divisions of predetermined area, as 1, 2, 3, etc., of the detail drawing reproduced herewith. The observer knowing, for example, that he is over division 7 and hearing the submarine noise in his telephone, signals that fact to an observer at some central station. Afterward, being over division 5, *if he still hears the sound,* he communicates that further fact. The central station observer thus becomes informed that the position of the submarine is first in division 7, for example, and that its course is to a second position as in division 5, and, therefore, northeasterly, while the time elapsing between the signals will show approximately the speed of the submarine in going from the first to the second position.

The boat may be simply a float in boat shape, or it may be an armed motor-boat with crew on board. In the latter case, as soon as the observer in the airship signals the crew of the detection of a submarine sound, the cable may be detached from the boat, leaving the microphone suspended from the cable, and the boat free to watch for and attack the submarine, or to give warning to other vessels in the vicinity. Any suitable means of release may be provided.

By noting where the sounds in the telephone become louder or fainter, and by steering in such a direction that the sounds become louder or remain in the same intensity, the observer in the airship can move in a direction and at a speed approximately that of the submarine.

The Worst Crime of Civilization

LIONEL STRONGFORT
"Dr. Sargent, of Harvard, declared that Strongfort is unquestionably the finest specimen of physical development ever seen."

AMONG all our laws for the protection of women and children there is not one to prevent a weak, sickly, anemic man—a creature who is a man in name only—from marrying some pure, wholesome girl and making her the mother of children destined before their birth to be a source of grief and anguish to her as long as she lives.

Men of America, what are you going to do about it? How are you going to protect your sisters and your daughters? How are YOU, who read this, going to protect your future wife and *do your part* to breed a race of strong, sturdy children that will be a credit to America, instead of poor, sickly, watery-blooded little creatures who have no chance in life, and who, when they grow up, will inevitably help to fill our insane asylums and our jails?

Men of America, Wake Up!

It's up to YOU, to every individual one of you, to make YOURSELF fit, first of all. It's a living condition that confronts you, not an academic theory. It's a condition based on the immutable laws of heredity, which have operated ever since the world began. It's a condition recognized by every breeder of live stock, and taken advantage of to improve the qualities of the cattle, horses or dogs he raises. It's the great inexorable Law of Nature that Like Breeds Like; that the progeny will inherit the qualities of the sire in an *intensified degree.*

Read those last two words again, and think—think *hard.* What will YOUR children be? If YOU are weak and sickly; poisoned by constipation, green with biliousness, tortured by indigeston, wrecked by nervous headaches, with vitality barely sufficient to carry you through your daily work—*what kind of children can you beget?*

Fit Yourself to Be a Father

You don't want to deceive the girl who loves and trusts you and wreck her life by making her the mother of children who will cause her to curse the day she married you. You want her to bear happy, healthy, laughing children, who will grow up into strong, virile men and women, a source of joy and comfort to you both in your old age.

FIT YOURSELF to beget such little ones, and at the same time to take the place among men in the world to which you are rightfully entitled. YOU CAN DO IT—there isn't any question about it—IF YOU MAKE UP YOUR MIND TO DO IT. You can get rid of the hampering ailments that are preventing you from being quick, efficient in your work and keeping you from getting a better job or higher position at bigger pay; you can break off any evil habits that are giving you a hang-dog feeling and making you ashamed to look your fellow men and women in the face; you can build up your flabby muscles, strengthen all your vital organs, make your blood rich and red and fill yourself with the punch and power of a REAL MAN, if you will stop "putting it off until tomorrow," *take hold of yourself and go about it the right way.*

Strongfortism Will Enable You to Do It

Strongfortism has lifted thousands of weak, ailing, impotent, discouraged men out of the bog of hopelessness and despair and placed them on the broad, straight road to health, happiness and prosperity. Strongfortism has restored the manhood they had destroyed and thought they had lost forever and given them renewed vitality, ambition and the power to DO THINGS in the world. Strongfortism has enabled them to beget children who will make Americans of whom both they and their country will be proud.

Strongfortism will do for YOU what it has done for them. It is simply Nature's way of living life; the way that has no drugs or medicines about it; the way that makes for health and power and potency; the way that gets the most enjoyment out of life. I KNOW whereof I speak. My lifetime has been spent in studying the human organism; in learning Nature's way of building up and strengthening the tissues of the muscles, the vital organs and the brain. I GUARANTEE results; I guarantee to improve you 100 per cent, physically and mentally, if you will follow my directions, and it makes no difference where you live, what your present condition is or whether your youthful follies brought you to it. You can follow out my course without interfering in any way with your present occupation, in the privacy of your own bedchamber if you like.

DON'T DELAY—tomorrow never comes to those who put things off. **Take the first step NOW.** Send for my FREE BOOK, **"Promotion and Conservation of Health, Strength and Mental Energy."** It will show you how to make a MAN of yourself. There's no charge for it; I ask you only to enclose 3-2c stamps to pay for packing and postage. Fill out the coupon and send it in TODAY. You'll hear from me by return mail with something you wouldn't miss for any money.

Be a
Mining Engineer

A great profession, not overcrowded, offers the diligent and ambitious student assured and exceptional rewards. *Located in the heart of one of the greatest copper mining districts in the world,* the College offers a unique combination of theoretical instruction with practical experience in all phases of mine development and operation. Four year course can be completed in three. Vast mines, mills, smelters, electrolytic and power plants of the most modern type, are practically a part of the College equipment and constitute a factor of enormous value in the courses of instruction. Every opportunity for specialization. A state supported college not conducted for profit. Established 1886. "M. C. M. Men Make Good." For descriptive book address Administrative Officer, Houghton, Michigan.

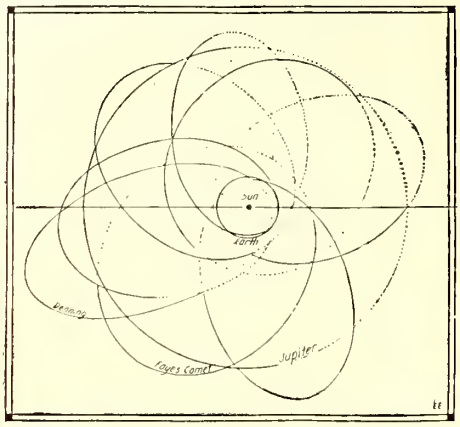
LEARN MECHANICAL DENTISTRY—DEMAND UNLIMITED

A paying professional trade: You will be a trained dental mechanic and receive our diploma when competent. Students given advantage of thoroughly up to date laboratory, and services of graduate Dental Surgeons on practical cases. No effort spared to place graduates advantageously. No age limit. Day or Evening. Individual instruction. No educational requirements. No book or home study. Easy terms. Highest references. Especially attractive proposition to those who write at once for catalog H.



Popular Astronomy

THE NATURE OF COMETS

By Isabel M. Lewis

(Continued from page 313)

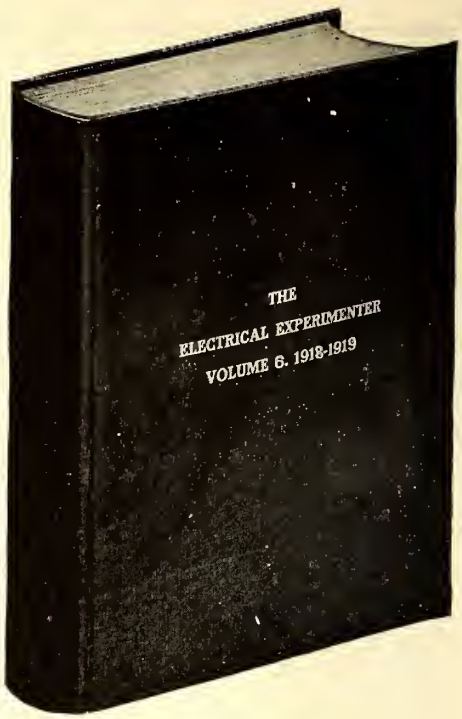
istic tail and peculiar cometary features are fully developed. As the comet again recedes from the sun after perihelion passage its speed slackens once more. It soon parts with all its spectacular features and fades rapidly away into oblivion.

This Diagram Shows How the Planet Jupiter Captures the Large Majority of the Comets. It Will Be Noted That Most of the Comets Are Grouped Around Jupiter's Orbit.

THE DISTINCTION BETWEEN STARS AND PLANETS.

THE chance enquirer into the mysteries of space usually is puzzled by the distinction that is to be drawn between stars and planets. All celestial objects except the sun, moon and a few chance comets he is apt to group together vaguely under the head of "stars" even to the "shooting stars."

The planets shine only by the *reflected light from the sun* around which they revolve, as does also the earth, which is one of the smaller planets. This light from the sun may be reflected from a rocky surface, as in the case of the moon, which is not a planet, to be sure, but a satellite *of* a planet, —the earth,—or it may be reflected by a cloudy atmosphere as in the case of Venus or from surface snow and clouds as in the case of Mars. The outer and larger planets Jupiter, Saturn, Uranus and Neptune, being chiefly in a gaseous condition, reflect sunlight from the gaseous vapors that envelope their central molten or gaseous cores.



Stars, on the contrary, are *suns* composed of intensely hot incandescent vapors of many chemical elements *emitting light and heat of their own.* The heat of the stars is inappreciable to us simply because they are so far away.

In size, the planets are conspicuously inferior to the sun and to the average star tho it is now known that there are some dwarf stars in existence that are as small as planets. The sharp distinction remains, however, that planets revolve around a central body that supplies them with the light and heat that they do not possess themselves, while the stars, however small they chance to be, shine by their own light and move thru space as independent bodies.

Not only is the distinction between stars and planets one of physical condition and, generally speaking, size. It is also one of relative distances.

The planets are all comparatively close to the earth. All are companion satellites of the same sun. The nearest Venus comes at times within twenty-six million miles of us and the farthest Neptune within twenty-seven hundred million, but the very nearest

(Continued on page 357)

This Book Cost $34,000

1200 Authors Contributed

Our Bound Volume No. 6 contains a goldmine of electrical and scientific information. No such value has ever been offered before for so low a price. A marvelous cyclopedia of electricity. A reference book of authentic information not found in any other book in print.

Volume contains twelve numbers of the "Electrical Experimenter" magazine — May, 1918 to April, 1919, inclusive. There are 984 pages, 2,110 complete articles, 1,908 illustrations, 369 questions and answers. Sizes, 12" high; 9" wide; 2" thick.

A world of electrical information; the entire electrical Progress for one year; the greatest reference book on current "Wireless"—all at a price within reach of everybody. Mind you, the book is durably bound in attractive green linen with heavy covers. Letters stamped in gold. You will be proud to have it in your library. We have only 600 copies, therefore be sure and order to-day. Shipping weight 8 lbs. Add a sufficient amount for postage, otherwise we must ship by express.

$3.00 add postage for 8 lbs.

Positively the Greatest Electrical book bargain in the World. We ship AT ONCE. Order today to avoid delay.

CARUSO CONCERTS TO AMATEURS BY WIRELESS 'PHONE.

Cleveland, Ohio, or that portion equipt with wireless receiving instruments, heard its first wireless telephone concert on the night of April 17th. And it is to become a permanent institution.

Every Thursday night between 8 and 10 o'clock the radio amateur or professional who "tunes" his instrument to receive wave lengths of 375 meters will be able to listen to strains from Caruso and Sousa's band interspersed with baseball scores and the latest news bulletins.

The concert will come from the plant of the Martin Company, air plant manufacturers and will be audible to wireless operators within 200 miles. It is estimated that 400 radio amateurs "listened in" on the first concert.

The wireless transmission of music is accomplished by use of the wireless telephones as developt by F. S. McCullough, wireless expert for the Martin Company. The same apparatus as is used in airplanes is employed and the music produced by a phonograph. The transmitting apparatus of the telephone replaces the phonograph horn. The baseball news and bulletins were announced by voice, so that no knowledge of "codes" were required to receive them.

Changing Nature's Face

(Continued from page 300)

copper wires extend from the blasting machine to one or more of the detonators. The ends of the two insulated wires inside the cap of the detonator are bridged by a very fine wire, which is soldered to the ends of the feed wires, and it is the heating of this fine bridge wire in the midst of the explosive charge, due to the passage thru it of the electric current transmitted from the dynamo, which ignites the cap explosive and in turn the main dynamite blasting charge. Electric blasting caps are made practically air-tight and water-tight, and are therefore safer to handle than the ordinary open-end blasting cap. It requires about 1½ to 2 amperes to melt the fine platinum bridge wire in the cap.

Connecting Wires

Owing to the small amount of current required, about 2 amperes, to melt the fuses in the electric detonators, and as these are invariably connected in series, a fairly small wire can be used to carry the current from its source to the location of the blast, as well as between the various charges, as shown in the accompanying diagram. No. 20 insulated copper wire is usually employed for connection between the dynamite charges in the holes. For the feed wires between the charges and the dynamo, a larger wire, such as No. 14 rubber covered copper conductor, is used. Several ways of connecting the charges in a group, as for instance in blasting a "ditch" or "brook," are illustrated in the accompanying diagrams, *A, B, C, D.* As will be seen, the various charges are connected in series. However, under some conditions the charges are connected in parallel. The series connection here shown is invariably used when a hand-operated *blasting machine* is employed to explode the charges. Parallel or series-parallel arrangements are used with dry or storage cells, or else an electric generator driven by a gasoline engine is used as the source of electricity for firing the blast. The standard blasting machines, fitted with magneto generators are designed in different sizes to fire from 1 to 200 charges, depending upon the type and size. The amount of current produced is about 3 amperes with this machine, while

Mechanical Engineering

Learn at Home!

Employers everywhere are looking for men with mechanical ability. Splendid salaries and rapid advancement are offered.

There is an easy, delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving men and women just the training they need for success in mechanical engineering and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

I Can Make You STRONG

I can show you how to develop every bit of strength that a real man should have. I can give you an abundance of vitality and a highly developed body and mind.

The Man who wishes to succeed in business must be endowed with an unusual amount of strength, endurance and vitality. I have found the way to develop these qualities in the shortest possible time. I have done it myself, with my own body, and I have done it for many other of the world's strongest men.

EARLE LIEDERMAN

The Acme of Physical Perfection

Let me take you in hand and make a real man of you. You will always bless the day that first you sent for my book. I can put pep into your actions, vigor into your step, and make your mind so clear and alert that you simply must go ahead in business and social life. There is no reason why you should go on through life all fagged out, more dead than alive. Let me change all this—let me make life worth living. Give me a chance to show you what I can do for you.

Send To-day for

MY NEW BOOK

"Muscular Development"

It tells how I can help you. I will send this valuable book to you by return mail on receipt of only 10c to cover cost of mailing and wrapping. Use the coupon below. The book contains full particulars of my splendid offer, and is profusely illustrated with pictures of many of the world's strongest men whom I have trained. **Don't pass this by. Sit right down and fill in the coupon. Do it now, this minute, while it is on your mind.**

the larger machines develop several hundred volts.

In some cases electric light or power circuits are tapt in order to furnish the necessary current for firing the charges. For example: if a circuit is supplying 250 volts and 10 amperes to a light or motor load beyond the point where the line is tapt, then this can be safely short-circuited and relied upon to fire 125 detonators in one series or five series of 625 detonators each. Such use of this current will not interfere with the operation of the motor or the lights, as connection is made for too short a time. Dry cells can be used for exploding electric blasting caps, but their rapid deterioration makes them unreliable. A storage battery will prove much more trustworthy.

How to Prepare the Blasting Charge.

The preparation of the load is accomplisht in several different ways and depends upon natural conditions where the blasting is to take place. Where ordinary wet ground such as in meadows or near a brook is to be blasted, in order to form another ditch or stream, it frequently happens that the necessary blasting holes may be drilled with a crow-bar. After the dynamite cartridge has been placed in the bottom of this hole with the electric detonating wires attached, the hole will in most cases fill with water, and this provides a satisfactory substitute for *tamping,* and will give very high efficiency when the blast takes place. It is interesting to mention in this particular instance, that in actual coal mining operations the drill hole is commonly filled with water instead of being tamped with coal dust, etc. Water being practically incompressible and possessing considerable inertia under the sudden bursting pressure of the charge, results in very high efficiency of the blast. Where a hole has been drilled in rock, or wherever it has been tamped or filled up with loam, the following proceeding is to be noted: To guard against danger of a prematurely detonating charge, the first five to eight inches of tamping over the dynamite cartridge should be *gently packed* by means of a tamping stick. When this amount of lightly tamped material has been placed, the rest of the tamping should be made as hard as possible, using a *wooden* tamping stick for the purpose. Moist clay free from gravel and clods makes good tamping material. Free running sand or moist loam is also effective. As pointed out in instruction books on the handling of explosives, it is not necessary to use any loam to tamp the drill holes, where the blasting is done in *watery ground,* or wherever the water will fill the hole to a depth of a foot or more. It is good practise, especially where heavy charges are used, to place two inches of paper or dried leaves immediately over the priming charge, so that they can be used as a safety marker, if the tamping has to be removed for any cause.

Purposes of Blasting.

The accompanying illustration shows three distinct purposes for the blasting operations carried on by agriculturists, and those desirous of cleaning up stump-strewn and rock-covered property. The method of using one, two or three lines of holes for blasting various widths of ditches is shown in the left-hand illustration. It is indeed surprising to learn that these ditches, in actual tests carried on before Government experts, have been blasted out with dynamite in the manner here shown. The bottom level of the ditch, when finished, was so nearly perfect *that not a shovel had to be touched to it.* In some cases, where specially deep ditches are desired, it sometimes becomes necessary to place another row of holes along the bottom of the first ditch blasted out, and then to blast this out.

The experts in charge of the blasting

usually drill a few holes and try several trial shots to ascertain the best depth and spacing for the holes. For ditches of three or three and one-half feet width, the depth of the holes will usually be 24 to 30 inches, and the spacing between the holes from 18 to 24 inches, altho it may be necessary to increase the depth and decrease the spacing in some cases. The test is usually begun with holes two feet deep and 18 inches apart. These are placed in lines and about 10 of them loaded with one dynamite cartridge each.

This loading, say the experts, should lift the soil at least 200 feet into the air and scatter it over the adjoining swamp for a distance of 150 feet, *leaving a clean ditch.* If such is not the case, then a different loading layout should be tried.

Blasting Stumps.

One of the principal uses of dynamite as utilized by agriculturists and by engineers in clearing up large areas containing obstructions is that of blasting out stumps. The lower illustration in the accompanying view shows how a large lateral stump is drilled, and how the electric blasting caps and dynamite cartridges are placed. The terminals of the blasting caps are connected in series, and the two wires run to the blasting machine which should be situated 250 to 300 feet away from the stump at least.

A new innovation in drilling the holes for stump blasting is the use of a portable electric drill or auger. One or more of these electric drills, as may be required, can be operated from a portable gasoline engine and dynamo outfit, or else from electric feed wires supplied by the local light and power company. Comprest air drills have also been used to some extent for this work and have proved very satisfactory. In all stump blasting it should be noted that the depth of the holes should reach to the sub-soil, not close up to or in contact with the wood. The best tools for making the holes are the crow-bar and the sub-soil punch.

Breaking Boulders.

There are three general forms of blasting applied to rocks, particularly those of the *boulder* class. *Blockholing* requires the smallest amount of explosives, altho more labor is involved with the drilling of a hole or series of holes directly into the boulder, as shown at the top of the right-hand illustration herewith.

Mudcapping, as depicted at the bottom of the right-hand illustration, requires the smallest amount of labor, but a considerably larger amount of explosives, while *snakeholing* is intermediate with respect to both labor and amount of explosives required. Each method has its own particular and special use.

Blockholing consists of drilling a hole into the boulder and charging it with a small amount of dynamite. It is the best and simplest method for breaking very hard or very large boulders, especially those of the "niggerhead" type, which are very difficult to break by other methods.

Snakeholing consists of punching a hole underneath but immediately against the bottom of the boulder, and placing a charge of explosives in as compact shape as the size of the boulder will permit. A boulder which has been snakeholed out of its resting place is shown in the accompanying right-hand illustration. As will be seen, the explosive, being confined on the under side of the boulder by the earth, can exert a powerful blow on the boulder and will force it out of its position or roll it out. If a sufficient charge is used, the boulder will be broken into fragments. The boulders should always be either pried out or snakeholed out of their resting places to the top of the ground, before attempting to break them by blockholing or a shattering blast of the type described above.

Learn Electricity

In the Great Shops of COYNE IN 3½ MONTHS

Thousands of Electrical experts are needed now. Come to the great shops of Coyne and let us train you quickly by our sure practical way backed by 20 years of success.

Earn $125 to $300 a Month

Come to Coyne where experts train you on the actual apparatus. You work on everything from the simple bell to the mighty Generators, Electrical Locomotives and Power Plants. Everything to make you a Master Electrician. Look at the picture taken from life in our shops.

Become an Expert in 3½ Months

No need of taking 1 to 4 years to become an expert. We have proved this in thousands of cases. We are the only school teaching by the original Coyne methods, which means no books, no classes—all practical training.

Earn Your Way. Our employment department will help every ambitious man to earn a part or all his expenses—without charge.

Mudcapping is known by a variety of fantastic and expressive names, such as "Bulldozing", "Blistering", "Poulticing" and "Adobe Shooting", and is made possible by the fast, shattering action of the higher grades of dynamite. In practise it consists of removing the dynamite from the shell and packing it in a compact conical heap on the boulder, and after inserting a cap and fuse covering it with several inches of thick, heavy mud.

The explosive should be placed on the boulder at the place where it would be struck with a hammer were it small enough to break in that way. This may be on the top or side. If the boulder is embedded in the ground, a snakehole shot to roll it out on the surface should first be made, *because the confining dirt makes it much harder to break with a mudcap shot.* The mudcovering should be as thick and heavy as it is convenient to make it, *not less than* 5 *or* 6 *inches,* and should be free from stones, *as the blast will throw them as tho they were bullets. Never lay a stone on top of the mud for the same reason.*

The explosives used are 40 per cent dynamite for easily broken rock and 50 per cent strength for hard "niggerhead" boulders.

Seam Blasting:—Frequently ledges and boulders have *seams* from which the mud or stone chips can be removed to a considerable depth. When such a seam is as much as one-half inch wide, successful blasts can be made by packing a reasonable amount of 40 per cent or stronger dynamite into the crack and tamping it securely with moist clay. This method will require about the same amount of dynamite as snakeholing, but is more satisfactory for badly-seamed boulders or ledges. The greatest care must be exercised in placing and tamping the charge *to prevent the expanding gases from escaping thru the cracks.*

Diameter of Boulder in Feet	No. of Cartridges Required: Mud-capping	Snake-holing	Block-holing
1½	2	1	¼
2	3	1	¼
3	4	1½	½
4	Don't attempt	4	¾
5	Don't attempt	6	1

This is based on the use of dynamite of 50 per cent strength. If 40 per cent dynamite is used, increase the amounts by half, and if Red Cross Farm Powder is used for snakeholing or blockholing, the amounts should be doubled.

Scrapping Old Machinery.

Breaking up old machinery, such as heavy castings or steam boilers, can be readily done with dynamite.

For scrapping a boiler use only 40 per cent or stronger explosives. Remove the dynamite from the shell and distribute in a continuous cord about half an inch in diameter all the way around the boiler, and secure it with a heavy mudcap. This can be placed along one of the seams more easily than on the smooth plates. When detonated such a charge will cut the plates almost as neatly as a shearing machine, and will reduce the cumbersome boiler to a size that can be handled.

For breaking heavy castings mudcapping is practised the same as on boulders. Sometimes a hole in the casting can be used for a block hole and loaded as described previously.

Large vessels and even boilers can be broken up *by first filling them with water, and, if possible, closing all openings.* The dynamite is primed and suspended in the water near the bottom or the thickest metal, *but must not be in actual contact with the metal.* The explosion of such a charge transmits a powerful blow to all sides and shatters them.

Brilliant Electric Lights and Big Profits in Battery Charging with this HB Lighting & Charging Set

With this sturdy, dependable HB outfit, you can make your own electric light at lowest cost, and charge auto batteries at the same time. You SAVE MONEY and make BIG PROFITS. Outfit runs from line shaft or engine. No wear out, trouble proof, economical.

Small Payment Puts This Money-Maker In Your Shop

Balance on easy terms. Profits pay for outfit. Absolute Money-Back Guarantee. Ask our Service Department about proper size for your needs. Pin this ad to your letterhead and mail **today** for information.

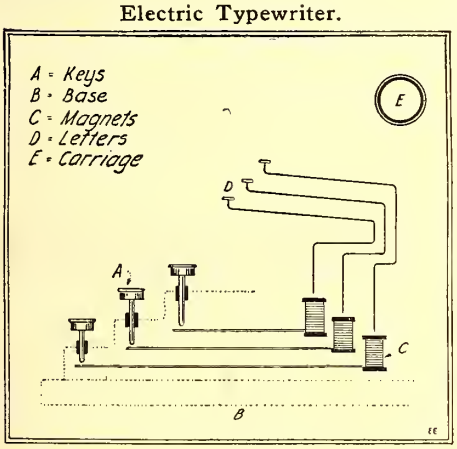
In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries addrest to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Automatic Cut-Out Switch.

(334) Ben Waigand, Nampa, Idaho, states: "I am enclosing a print of a patent my brother and I took out some time ago. I would very much like to hear from you as to its worth in the electrical field. Also what we shall do with the patent.



A. The invention relates to an automobile cut-out switch which is to produce a mechanically operated means, whereby, when a fuse in a three-phase circuit is blown, the switch connecting the circuits will be automatically thrown out of operation from the circuit. In three-phase circuits, one of the fuses may be blown, but this does not entirely break the circuit since it will continue to operate on a one-phase circuit, tending to overheat the motor or diminish the lights. By means of this invention, however, upon any of the fuses being blown, the switch is thrown open automatically. This seems to be a very good idea except for the fact that the fuse links which work this switch are exposed all around, which we believe is against the Fire Underwriter's ruling. Some device should be attachable whereby this objection is overcome. Otherwise, we think the patent is a good one. How successful it will be from a commercial standpoint we have no means of knowing. It all depends upon the owners of the patent who wish to exploit it.

Mechanical Converter.

(335) Herbert M. Hubs, Indianapolis, Ind., wishes to know if he could obtain a patent on a mechanical current converter which he designed. He claims that it will work with an efficiency of 80%.

A. It is impossible to say off-hand if a patent can be obtained on the idea as we do not know what it is about. We do not know the technical details; for that reason we cannot give any intelligent advice.

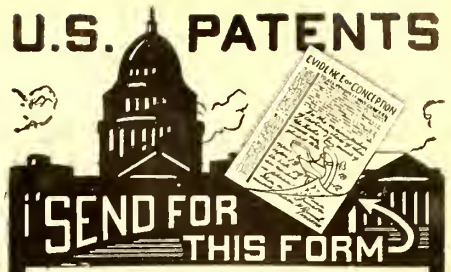
Electric Typewriter.

(336) Lucius M. Turner, Royston, Ga., writes as follows: "I have an idea which I think is entirely original concerning a typewriter that will work with electromagnets. My idea is as follows: Have each key used as a switch or, in other words, used like a telegraph key. As you are aware, each arm on which the letter is attached is shaped somewhat as shown in diagram. When the key is pressed the circuit of that particular magnet is closed. For instance, take the letter 'K.' Press the letter K and that closes the circuit of that certain magnet and the letter K is made. Magnets are located under each letter, as shown in illustration. IN THIS WAY ALL LETTERS WILL BE HIT WITH EQUAL FORCE. In reading letters and typewritten matter you often see some letters less plain or dimmer than others. This would be absolutely avoided. The magnets would be very small and therefore consume very little current. The current could be supplied with a few batteries located under the table or in the drawer, or in any other convenient place that is not needed. Please advise me as to whether it could be patented, and if it would be practicable. Also if it could be manufactured at a reasonable price (please give me some idea as to the price) and if I could find a ready market for same."

A. A very clever idea, and it seems it has the germ of a possible great future. Our present typewriters are operated on a very antiquated plan, and have not been improved since Remington built his first machine. What we refer to is the muscular energy it takes in operating a typewriter. It is rank foolishness in this age of invention and electricity to ask people to wear themselves out by pounding the keys. Electricity should be the mover. Mr. Turner in his invention has shown a very simple way of doing it. He uses the keys to establish the contact. Even the slightest touch will close the circuit. Then electricity, plus electromagnets, will do the rest. Each electromagnet will pull down its key. It thus should be possible to operate a typewriter with the very slightest touch, and each typewriter could be plugged into a light socket or otherwise, a battery or storage battery without any trouble whatever. Of course, the details will have to be worked out to make the device practical, but we certainly think that it is a coming thing. We believe also that such a typewriter could be marketed at a cost only slightly higher than the present-day machine.

We think a patent can be obtained on this invention without much trouble, and we would advise our correspondent to get in touch with a patent attorney at once.

Auto Tail Lamp.



(337) G. R. Smathers, Charlotte, N. C., says: "I have invented a combination auto tail lamp. It is a combination affair of two lamps in one, one being red, the other white. Either red or white bulbs can be used, or instead use red or white lens. It is electrically operated and is provided with extra "push" for white light, which is to be used in backing out of garage or "turning around" at night, in order to avoid "backing" into obstacles such as fences, ditches, etc. The white light, which is larger and brighter than the red one, serves the same purpose as do the front headlights. This device is also provided with the well-known license-plate bracket. The red light throws a white light on plate from under side."

A. From the description and drawings which we have inspected, we do not see anything fundamentally new in the device, and we doubt very much that a patent can be obtained on the combination. There are many similar devices on the market now.

Adjustable Book-Mark.

(338) N. Alpert, Sedalia, Mo., submits description and model of a new article of manufacture. In part he says: "Please advise me whether I can obtain a patent on an adjustable book-mark. It is to

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

RANDOLPH & CO.
Dept. 172 Washington, D. C.

be made of two strips of steel. The adjustable strip is so fastened that it is able to slide up and down or sideways. The stationary strip can move sideways in either direction. Near the end of this strip and on the underside, a clip is attached, by which the whole thing may be fastened to a page. I am sending a rough model with this letter. It will give you an idea of how the device will work.

A. This is a very clever idea, and we think there ought to be a market for it. It could possibly retail for five or ten cents, and for this reason five-and-ten-cent stores would probably be a good market to exploit the idea. We think a patent could be obtained.

Improved Fuse Plug.

(339) Thomas Sheehan, Duluth, Minn., wishes to have our opinion on an improved fuse-plug which works on the thermo-electric principle, similar to the *blinker contact* arrangements, that blink electric lights. This fuse is made similar to the regular fuse, except that in the interior it has a steel wire, which has a tendency to contract when a certain number of volts and amperes pass thru it. Naturally the wire must be of the gage that will not contract unless the voltage is over 110 volts. Our advice is asked on this invention.

A. While this is a very clever idea, and while no doubt it works and perhaps a patent can be obtained upon it, we doubt very much whether it would prove a success from a practical standpoint. We think the Fire Underwriters would not allow such a fuse plug to be put in use, for the reason that there probably would be bad arcing at times, and the heating effect therefrom would endanger fixtures, etc.

A gold palladium alloy which makes an acceptable substitute for the more expensive platinum iridium alloy used in chemists' utensils has been developed by metallurgists in California.

CREDIT CORRECTION NOTICE.

How to Make Photo-Micrographs

(*Continued from page* 317)

will require a shorter exposure than dense objects or objects stained with carmine or picric acid. The experimenter should use his own judgment in regard to the length of exposure; some idea of the length of exposure may be obtained by examination of the photo-micrographs here shown.

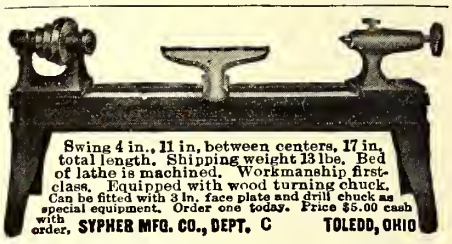
No. 1. Scales from the wing of the moth of the grape-vine cut-worm, and are a good example of the scales which cover the wings of all moths and butterflies. This is the "dust" which comes off on the fingers when holding a butterfly or moth by the wings. Different shaped scales will be found on the same insect by taking scales from the various parts of it.

No. 2. Parenchyma of sunflower leaf; the specimen was obtained by stripping a small piece of the epidermis from the upper part of the leaf. The large pointed objects are hairs, the thin jagged lines mark the cell walls; the small objects shaped somewhat like coffee grains are the stomata by means of which the plant takes in CO_2, its principal food, from the air.

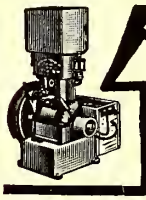
No. 3. Part of the surface of the under wing of the squash bug. The photo shows cells and the opening of glands which exude moisture, keeping the wing from becoming brittle. The dark line is part of a vein.

No. 4. Is a micro-photograph of the nitrogen fixing organisms from a nodule on the root of a pea. These micro-organisms have the property of fixing nitrogen from the air.

No. 5. Tip of antenna of May beetle; the short sharp bristles are the sensory organs, probably the sense of smell.



No. 6. Tip of the wing of the crane fly, showing covering of fine hairs.



For the average experimenter a microscope having a magnification from 15 to 250 times is sufficient, and with it photographs of pollen, mould, mildew, et cetera, can readily be made.

Popular Astronomy

By Isabel M. Lewis

(*Continued from page* 350)

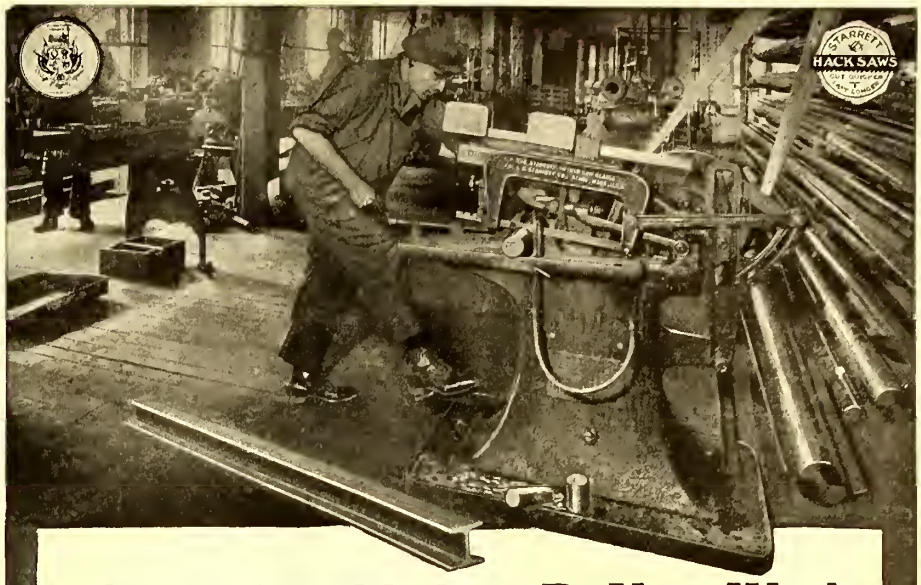
of the stars is twenty-six trillion miles away. An inconceivable great abyss separates the sun and his planet family from the stars.

It is because they are so near that planets appear disk-like in the telescope, just as the sun and moon appear disk-like without the telescope. Even in the most powerful telescope in existence the stars appear as points of light simply because they are so distant.

Since the planets are so near, they appear to wander thru the sky from day to day and from year to year, the result of the earth's motion around the sun as well as their own motion. As a result of these two motions their apparent motion thru the sky is very complicated and the nearer the planet is to the earth the greater the rate at which it appears to move thru the sky from day to day. The stars, on the contrary, are apparently immovable for many hundreds of years, tho in reality they are in rapid motion thru space.

The continual change of position of the planets is confusing to the beginner who desires to learn to know the grouping of the stars into constellations. It is quite disconcerting to find an unknown bright star where none is indicated on the map. Perchance the observer may think he has discovered a brilliant *Nova*, but Novae, especially brilliant ones, are extremely rare. Gradually the fact is brought home that the unknown object is simply one of the five planets visible to the naked eye.

Uranus at the limit of visibility and Neptune far beyond it we need not consider.



Venus and Jupiter one soon learns to recognize by their unusual brilliancy which far surpasses that of the brightest stars. They are distinguished from each other by their distinctive colors and relative brightness. Venus is always a clear sparkling white and considerably brighter than Jupiter who glows unflickeringly with a slightly yellowish tinge .

Mercury, "The Elusive One," as the ancients called him, is rarely seen as he is always so near the sun. When it is possible to catch a glimpse of him in spring or fall when the ecliptic rises most sharply from the horizon, one marvels at his beauty and brilliancy as he twinkles in the twilight with the splendor of a first magnitude star.

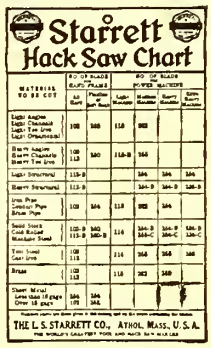
Mars, "The Ruddy One," always glows with a deep red tinge but changes very greatly in brightness. When far away from us Mars is very like Antares, the deep red star glowing in the heart of the Scorpion low in the southern, summer sky. When comparatively near to the earth, however, Mars is one of the most strikingly beautiful objects in the sky and surpasses all stars in brilliancy.

Saturn, never particularly interesting without the telescope, is dull leaden colored and, in brightness, resembles a number of first magnitude stars. It is, therefore, more easily mistaken for a star than any of the other planets. It is easy to keep track of this planet when it is once found, however, as it takes nearly thirty years to make one trip around the sun and therefore moves eastward among the stars about twelve degrees a year.

During July and August the splendor of Venus will attract the attention of even chance observers of the heavens. It will be "Evening Star" during these months, as it has been during the spring and early summer and will reach its greatest brilliancy on August seventh. After that date it will draw rapidly nearer the sun.

Choose Your Blade to Fit Your Work

If you've been cutting 3" round machine steel with a heavy gage, coarse blade and find your next job is on structural beams—7" I beams, for instance—it's cheaper to change to a blade designed for that class of work than to keep on with the coarse blade you used on round stock.



The smaller the cross-sectional area to be cut, means fewer teeth engaged at any single instant and a corresponding increase in wear on the blade at that point. Also, the fewer teeth used the sooner they will dull and the greater likelihood of stripping.

That's *one* reason why the Starrett Hack Saw Chart recommends different blades for different kinds and shapes of metal. In this case, our tests show that a blade with more teeth to the inch should be used on structural steel than on round stock.

Inside a U-Boat

(*Continued from page 309*)

captured enemy craft, the U-117, U-140, UB-148, UB-88 and the UC-97. The views here reproduced were taken on board the surrendered submarine U-105, and the machinery shown is typical of the other German craft of this type.

Under a U-boat's Deck.

The submarine UC-97 was a smaller craft than some of the others, but proved to be one of the most troublesome craft possest by the enemy during the war. This boat was designed to serve as a mine layer, as well as being fitted for carrying torpedoes, and provided with a 4.1 inch deck gun. She was propelled by oil-burning Diesel engines, each rated at 300 h.p. for travel on the surface. Propulsion when submerged was accomplisht by means of four compound-wound interpole generator-motors, mounted in pairs on the same shaft and coupled to the engine by means of a clutch. Each generator-motor unit developed 100 kilowatts capacity, or 130 h.p., when running as a motor at full load. These machines were artificially cooled. When these units are driven by the Diesel engines, while cruising on the surface, they operate as dynamos and charge the storage batteries. When submerged the engine clutches are thrown over, and the generators are now operated as motors by the electric current supplied from the storage batteries. A motor-driven air compressor supplied the necessary compresst air for discharging the torpedoes, emptying submerging tanks, et cetera. The electrical control and switchboard rooms on the UC-97 are situated forward of the engine room, from which all electrical apparatus is controlled. The hull is divided off into water-tight compartments which can be sealed off individually by close-fitting doors. The control room is directly below the conning tower. In this control room we find apparatus for steering the vessel, firing the torpedoes, planting the mines, also for filling or emptying the submerging tanks. Much of this part of the control equipment is installed in duplicate, so that if one set is disarranged the other set may be instantly put into service. The U-boat is steered by electric motors, provided in duplicate. One motor is placed aft and one forward, thus reducing the chances of becoming totally disabled to a minimum. It is possible to maintain the U-boat within two feet of any specified depth below the surface by discharging from or letting in water to the submerging tanks. There are provided elaborate and carefully calibrated depth gages on all submarines which indicate at any instant the exact depth at which the submarine is submerged. One of the accompanying photographs shows these depth gages.

Collapsible Motor-Operated Periscope.

The periscope is a collapsible affair which can be quickly elevated, thanks to the ubiquitous electric motor, for the purpose of taking a "sighting" and then quickly lowered. Two periscopes are invariably provided, in the event that one should become fouled or shot away. The periscope measures approximately four inches at the base and two inches at the top, thus reducing the visible portion and its accompanying "wake" to the smallest possible dimensions. This is highly important as the "wake", if very broad, can be easily seen by a sharp enemy look-out. Aiming at the head of this wake, the eagle-eyed gunner can make things highly unpleasant for the submersible.

In the forward part of the submersible are located the officers' quarters and the radio operating room, as well as the sub-sea telephone apparatus, by means of which the sounds of the propellers and engines of ships can be heard several miles away.

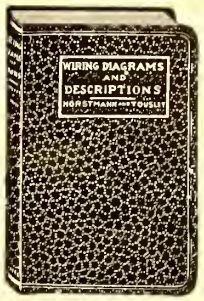
The Under-water "Ears" of the U-boat.

No wonder the surreptitious U-boats popt up in the least suspected places, for they could detect an enemy merchantman one to two hours' sail away. By carefully listening to the sounds picked up by the microphones mounted in the shell of the vessel, a steamer or warship could be trailed or maneuvered around for miles. U-boats have been known to dodge the Allied destroyers for periods of three and four hours; "blind-man's buff" you might call it, but he who laughs last laughs best, for the destroyers carried a better under-water sound detector than the "Heinies" and every move along his tortuous course was closely checked up. Periodically, depth charges were "let go" and many times, more than the Germans care to admit, the final crunching sound of a vanquished U-boat, as the depth bomb spelled its doom, came to the ears of the destroyers' officers via the sensitive hydrophone. The U-boats could be trailed just as accurately finally, as if they had been maneuvering on the surface of the sea.

Life on these craft was not to be craved for, especially when a U-boat got cornered and had to lay on the bed of some sound or harbor, for 10 to 15 hours. Electric cooking utensils were supplied, the same as on all of the Allied submarines.

The larger U-boats measured 300 feet and more in length, and had a capacity of 20 or more torpedoes and 45 mines. Craft of this type are propelled by two powerful Diesel engines, developing 1,200 h.p. each, for cruising awash, charging the storage batteries, etc., and when submerged propulsion is effected by a set of four 500 h.p. electric motors. The motors are operated as generators while awash, when it becomes necessary to charge the batteries. These large sub-sea craft often had a cruising range as great as 7,000 miles. The speed of this type of craft on the surface is about 19 knots and submerged about 10 knots. They carry two disappearing deck guns of 4 to 6 inch caliber. The torpedo tubes are four in number at the bow, while two are provided at the stern. At the bow of the U-boat the Germans mounted a cleverly contrived saw for cutting thru sub-aqueous nets. Even so, the nets placed in the waters about the English coasts enmeshed many of them, from which they endeavored to struggle loose in vain, as the official Admiralty reports prove. It may be said in closing that, contrary to the usual expectations, inspection showed the workmanship on the machinery of these U-boats to be very plain and ordinary.

Go to Church by Telephone



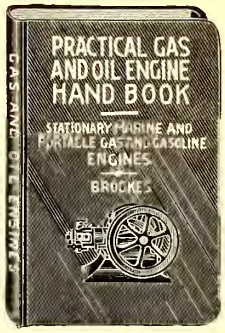
Holding church services by telephone was one result of the influenza epidemic. This was done by one church in Muncie, Ind., which arranged that at 10:30 o'clock, thru the coöperation of the local telephone company management, the telephones of all subscribers who wished should be connected with the telephone in the church, to which a special microphone was attached. The church organist also played a few numbers, which were thoroly enjoyed by the listeners.

Fit Yourself for the Big Job

Don't hesitate any longer. There is a greater demand for trained men now than ever before — greater opportunities — bigger pay — more rapid advancement. It's training that counts now—accurate knowledge—a complete grasp of your trade.

Drake's Practical Mechanical Books

For Home Study



Pave the way to the fat pay envelope. Written in non-technical language that any man can grasp. Send the price of any book listed below. We will send the books postpaid — you keep them five days—if not entirely satisfied return the books and your money will be refunded in full. Order direct from this page. Use the Coupon.

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed **Norway Iron Core Wire** and are selling this wire to "Experimenter" readers

At Pre-war Prices, 20cts. lb.

This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire.

We have only one size left:
24 INCHES LONG.
Thickness about No. 21 B and S

If this size should be too long we advise cutting the wire down yourself by means of shears.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound. Add postage or we will ship express collect. Order at once.

Electro Importing Co., 231 Fulton St., N.Y.C.

How I Invented the Crystal Detector

By Dr. G. W. PICKARD

(*Continued from page* 325)

great improvement over the coherer, I soon found that it, also, had defects. Severe static or nearby sending would usually cause a partial or complete paralysis of the contact, curable only by the hit-or-miss process of repeatedly jarring the detector so that new contact points were formed, or the old ones unwelded. Even in the absence of severe electrical disturbances, the contacts gradually became, as it were, fatigued, and the signals weakened toward inaudibility, unless periodically restored by jars. Then, also, the microphone detector lived up to its name by acting as a microphone, picking up any slight sound or vibration in a most annoying way. Finally, even if the detector was screened from sounds and jars, it was prone to develop a hissing or frying sound, which overlaid faint signals to their obliteration.

The Contact Detector Is Invented.

In the first part of the year 1902, the American Wireless Telegraph and Telephone Company erected stations at Atlantic City and Cape May, N. J., about 40 miles apart, and also equipt the schooner *Pleiades* as a floating experimental station. On May 29, 1902, I was in the Cape May station, experimenting with a new system of tuning, and receiving signals from the *Pleiades*, then about two miles off Cape May. The detector I was using consisted of several fine sewing needles, laid lightly across a pair of carbon blocks, and in series with three cells of dry battery and a telephone receiver. Becoming annoyed at the microphonic "fry" of my detector, I attempted to check this by, as I thought, cutting out of circuit two of the three dry cells. The frying ceased, and the signals, tho much weakened, became materially clearer thru being freed of their former background of microphonic noise. Glancing over the circuit, I discovered to my great surprise that instead of cutting out two of the three cells, **I had cut out all three**, so, therefore, the telephone diafram was being operated **solely by the energy of the receiver signals.** A contact detector, operating without local battery, seemed to me so extraordinary, so contrary to all my previous experience, that altho I did not then know the reasons for its operation, I appreciated its possible great value to the art, and resolved at once to thoroly investigate the phenomenon at the earliest possible moment. This entirely accidental discovery was the foundation of my invention of the crystal detector.

Silicon and Other Detectors Invented.

During the summer of 1902, I was concerned with the development of a system of radio-telephony, conducting this work in the Boston laboratory of the American (Bell) Telephone and Telegraph Company. As one of the essential elements of this system was a detector which would respond quantitatively to telephonically modulated electrical waves, I at once began a series of tests, first with the form of the carbon-steel microphone I had used at Cape May, and then with other contact materials. Discovering that such detectors responded quantitatively to musical spark signals up to at least 2000 sparks per second, and were therefore capable of receiving speech, I devoted my energies for the time to the transmitting end of the system, finally discovering, in the fall of 1902, an effective means of telephonically modulating a stream of electrical waves. Returning to the detector development, I found that the Telephone Company had in their laboratory a large quantity of magnetite ($FeO.Fe_2O_3$) crystals, which had been procured as a possible material for loading coil cores. I broke one of these crystals apart, exposing a fresh fracture face, made a small area contact thereon with a brass point, and found that this crystal, like the carbon steel detector, operated well without local battery, but, unlike the carbon-steel contact, did not require a light or microphonic contact for best operation. In the period 1902 to 1906, I tested many different minerals and combinations, including magnetite, pyrite, galena, molybdenite, silicon and zincite. Much development was also required on holders for these minerals. Perhaps one of the greatest early stumbling blocks in such development was the old coherer idea that extremely light pressure contacts were necessary. With the carbon-steel microphone, this was still true, but I can remember my surprise when I found that many of the minerals worked best with quite high pressure contacts.

31,250 Crystal Detectors Invented.

A list of the several thousand materials I have tested would make dry reading. *Suffice it to say that I have found some two hundred and fifty minerals and furnace products which make operative detectors, either against metallic contacts, or in combination with other minerals. The possible combinations of these two hundred and fifty substances, amounting to some* 31,250 *pairs, have all been tested by me, or by my assistants, and many hundred useful pairs have been found.*

Oscillating Crystal Detectors.

The last word on crystal detectors and their uses has yet to be written. **For example, it may be of interest to know that they can be made to OSCILLATE, under proper circuit conditions, and I have found it possible to receive intelligible signals from UNDAMPED wave stations across the Atlantic, on a simple contact between a fragment of galena and a fine wire.**

MOTHER SHIPTON TOLD OF AVIATION IN 1488.

The following, which is known as "Mother Shipton's Prophecy," was first published in 1488, republished in 1641 and again in 1875. It will be noticed that all the events predicted in it except the last two lines have come to pass:

Carriages without horses shall go;
And accidents fill the world with woe.
Around the world thoughts shall fly,
In the twinkling of an eye;
Water shall yet more wonders do;
How strange, yet shall be true.
The world upside down shall be,
And gold be found at root of tree.
Through hills men shall ride,
And no horse or ass be at his side.
Under water men shall walk,
Shall ride, shall sleep, shall talk.
In the air men shall be seen,
In white, in black, in green.
Iron in water shall float
As easy as a wooden boat.
Gold shall be found, and shown
In a land that is not known.
Fire and water shall wonders do,
England shall at last admit a Jew.
The world to an end shall come
In eighteen hundred and eighty-one.

(It is curious to note that only the last two lines—WHICH DO NOT RHYME—have failed to come true. All the others that do rhyme did come about as prophesied!—Editor.)

THE ONLY VACUUM TUBE WHICH AMATEURS CAN USE

Fleming Pat. No. 803684
De Forest Pat. Nos. 841387-879532

Agreements recently effected have made vacuum tubes available for experimental use. The Marconi V. T. is the only vacuum tube, or audion, which may be sold to amateurs, laboratories, schools of instruction and experimenters.

MARCONI V. T.

$7.00 each

Standardized base $1.50 additional

A highly developed, all-around tube for use as a detector and amplifier in wireless communication. It has practically the same electrical constants as the tube used by the Allied armies and navies throughout the war in continuous wave transmission and reception. The terminals of the elements of the tube are brought out to a 4-prong standardized base, fitting into the standard four-contact bayonet sockets.

Filament current, 0.7 ampere. Filament potential, 4 to 6 volts.
Plate potential, 20 to 60 volts for reception.

For lighting filaments a *lead* storage battery is preferable because of its constancy of voltage. Ordinary dry cells or flashlight batteries may be used to provide the plate voltage.

The approximate operating life of the MARCONI V. T. is 1,500 hours.

Delivered postpaid in special container insured against breakage to any address upon receipt of purchase price.

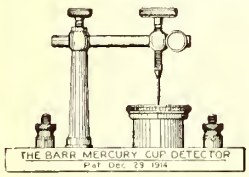
HALCUN
BAKELITE AUDION PANEL

A die molded panel. 5" by 9" 3/8" thick. A beautiful permanent glossy black. Wires and all connections molded right into the panel, entirely concealed, impossible to corrode or become loosened. Switches all of the bearing type, large shafts to prevent wear.

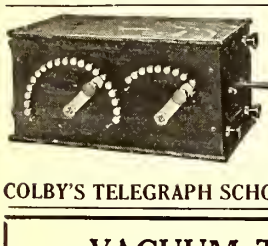


All metal parts nickeled. Connections arranged for damped spark, undamped arc, regenerative and ultra connections. There is nothing like this panel on the market. It is a quality article thruout. Other manufacturers ask more for wood and thin sheet panels.

The Halcun panel is 3/8" thick with a beveled edge provided with supporting brackets. Price, less bulb, prepaid **$12.50**

Our big full-line catalogue 6c.

HALCUN RADIO CO. 437 Market St. San Francisco, Cal.



THE BARR
MERCURY-CUP WIRELESS DETECTOR

The most efficient Detector on the market. Tested by the United States Government and Marconi Wireless Telegraph Co.

Increases the efficiency of every wireless receiving set by making the signals clear, sharp and distinct.
Instantly adjustable at a constant pressure.

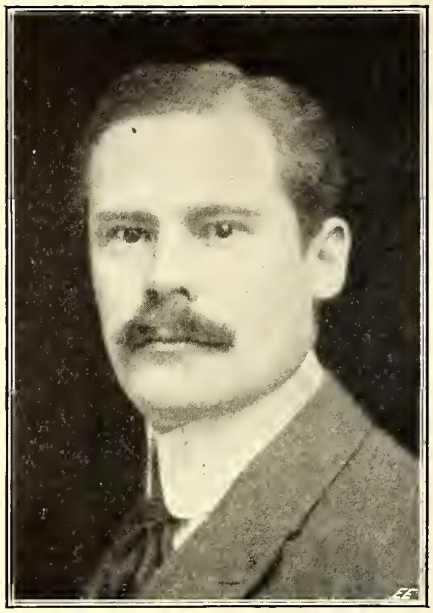
Our new cat. "E" of electrical and wireless apparatus and code chart sent for 3c stamp.
THE WILCOX LABORATORIES LANSING MICHIGAN

E. F. W. Alexanderson Wins "I. R. E." Gold Medal

At the May meeting of the Institute of Radio Engineers held in New York City, May 7th, E. F. W. Alexanderson, consulting engineer of the General Electric Company, was awarded the gold medal of the institute in recognition of his original research and inventions in the radio field.



In accepting the gold medal, Mr. Alexanderson said:

Such great strides have been made in all fields of science and engineering during the emergency of our late war that I feel it a specially high honor to receive the Radio institute medal at this time.

"The radio art has drawn its talents from almost every profession. Broadly speaking, radio men may be classified as radio physicists, radio engineers and radio amateurs. In a sense we are all amateurs and we shall never know who was the first amateur. We do know, however, that the first radio physicist was Hertz who discovered and determined in his laboratory the laws of electromagnetic radiation. We also know that the first radio engineer was Marconi, who made the first use of electromagnetic waves for practical communication and developed the wonderful system which for the last 20 years has made the high seas safe for navigation.

"Fessenden conceived the possibility of bringing radio engineering within the realm of power engineering, and it was my privilege, due to connection with the General Electric Company, to develop the first radio frequency alternator. Indeed it was thru the work which this Company was requested to do for Fessenden that my interest in radio communication was first excited, and this has resulted in the contributions which I have had the opportunity to make to the radio communication of today.

"Radio telephony is a by-product of the development of sustained radio waves as a method of alternating current power transmission. With the previous system of spark telegraphy it was no more possible to transmit the modulation of the human voice than it would in land telegraphy to reproduce speech from the dots and dashes of the Morse code. But with the sustained energy of the continuous wave, it has become possible to put a dynamo electric machine behind the wave and vary the flow of power in correspondence with the modulations of the human voice, thus making long distance radio telephony possible.

E. F. W. Alexanderson, Well-known Radio and Electrical Engineer, Awarded the "I. R. E." Gold Medal.

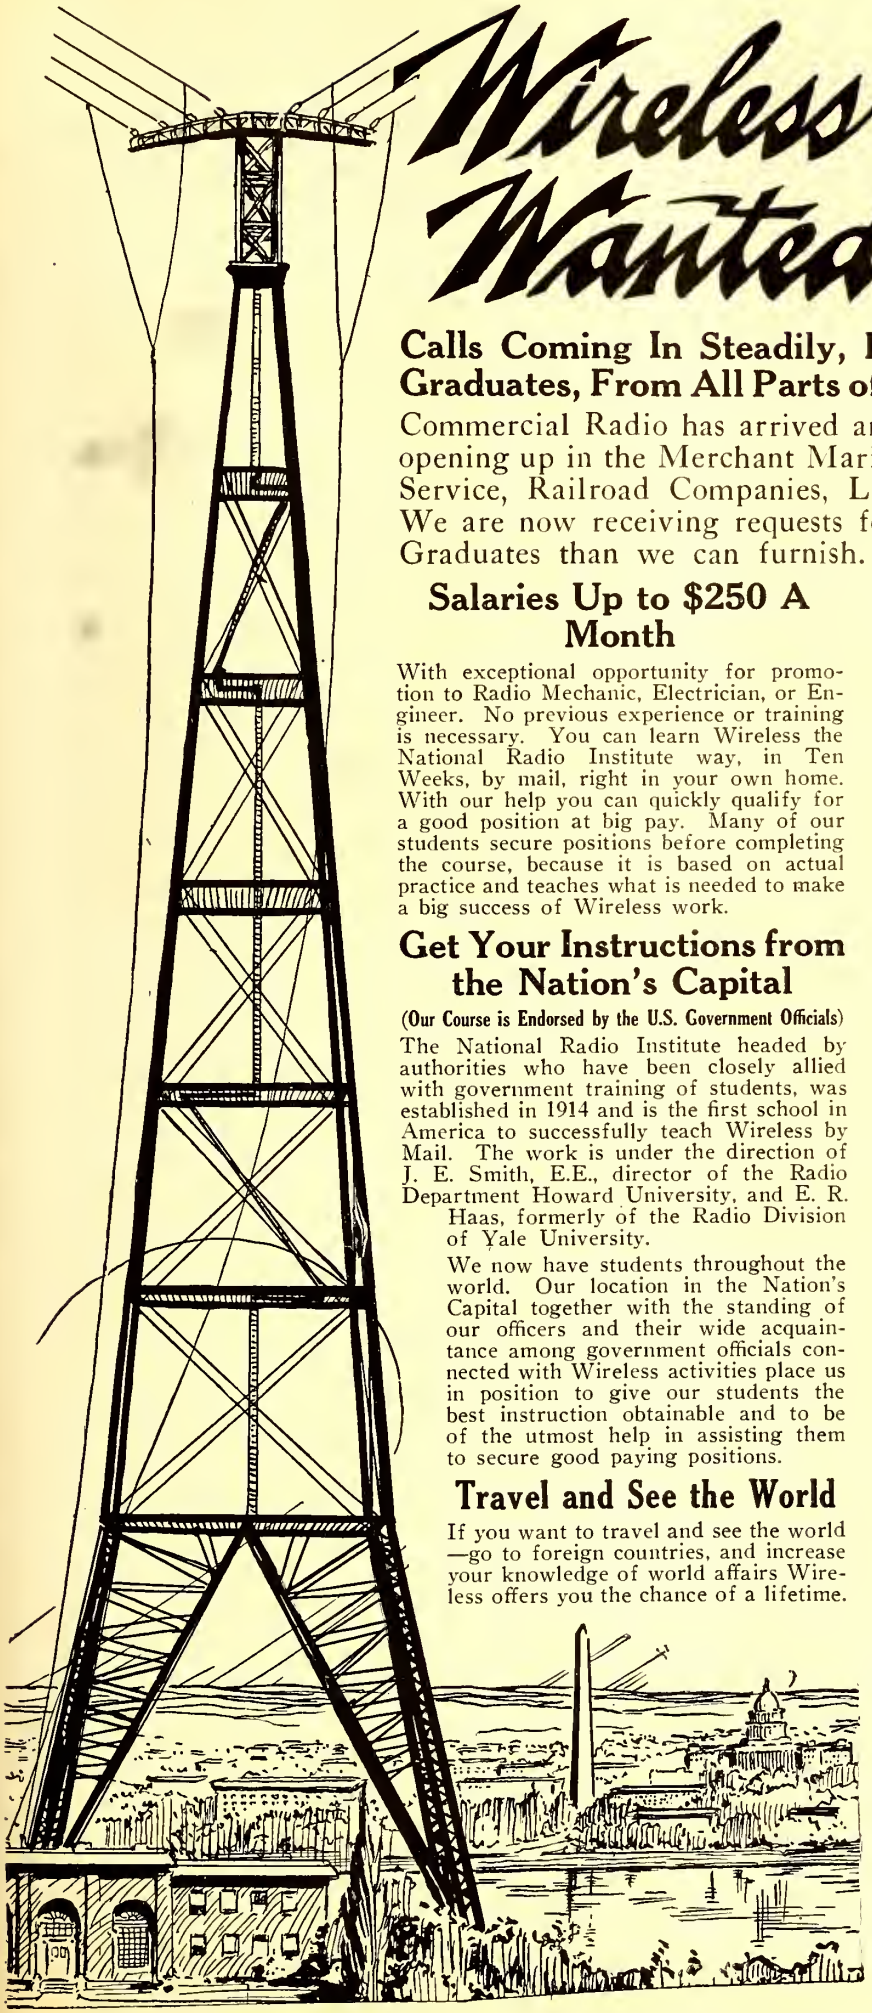
"Mr. President and members of the institute, it has been a privilege to be connected with the great development in radio in the last years and I wish to express my deeply felt appreciation of the recognition represented by this beautiful medal. I thank you."

Concentrated or Loop Aërials

(*Continued from page* 328)

from B to D no sound, and then from D to C another rise and fall of intensity, the maximum in each case occurring when the plane of the loop is along 30-210° line but the signals in A B sector are about twice as loud as in C D sector; this gives the direction of signal in direction of arrow. If however the connections of Fig. 4, are used then the result will be as shown in Fig. 6. The signals will be much louder and will be heard only in the A B sector, thus making it strictly *undirectional.* If the loop be grounded on the grid side, then Fig. 7 shows the result, i. e., *loud signals but NO directional effect whatever.*

Fig. 3 shows the connections when it is desired to receive on other than the wave length of the loop. In practice it will be found to be simpler to have several loops of proper wave lengths rather than be bothered with a tuner.



As many navy and army operators know, the loop eliminates a lot of interference and also static. However, if it is desired to eliminate static more effectively, then it is necessary to take the loop and outfit into the cellar or under ground. Signals will be found to come in just as loud as tho an elevated aërial were used, but the static will be absent, *even in the midst of a thunder-storm* when an ordinary aërial "spits fire."

The loop shown in the photo and diagram Fig. 8, consists of 240 turns of No. 22 S. C. C. and with a 43 plate variable condenser has a range of from 2,000 to over 3,000 meters. Larger loops can be made if it is remembered that the same length of wire is required. The inductance is determined by the area turns, and hence a small loop will act about as well as a large one. If several loops are operated simultaneously from known points, but separated some distance, the exact location of the sending station can quickly be determined. And further if the circuit of Fig. 4, is used a very large amount of interference on the same wave length can be eliminated, since only such stations as lie in the region from 150° to 270° will be heard at all, while receiving from 210° and as the outfit tunes sharp much of this is cut out. By carefully adjusting the apparatus as good receiving can be done on the loop as with the ordinary aërial, and all other features will be additional. *Stations 200 miles away can be located to a pin point on the map.* Thus the Radio Amateur has opened to him a wide field that will make possible better work with less bother.

RADIO TELEPHONE BETWEEN ROME AND TRIPOLI.

Wireless telephone communication is maintained between Rome and Tripoli, 600 miles apart, mainly over water.

www.americanradiohistory.com

Wireless Operators Wanted—At once

Calls Coming In Steadily, For National Radio Institute Graduates, From All Parts of the Country.

Commercial Radio has arrived and thousands of positions are now opening up in the Merchant Marine, Aerial Mail and Land Station Service, Railroad Companies, Lake and Ocean Steamship Lines. We are now receiving requests for more National Radio Institute Graduates than we can furnish.

Salaries Up to $250 A Month

With exceptional opportunity for promotion to Radio Mechanic, Electrician, or Engineer. No previous experience or training is necessary. You can learn Wireless the National Radio Institute way, in Ten Weeks, by mail, right in your own home. With our help you can quickly qualify for a good position at big pay. Many of our students secure positions before completing the course, because it is based on actual practice and teaches what is needed to make a big success of Wireless work.

Get Your Instructions from the Nation's Capital

(Our Course is Endorsed by the U.S. Government Officials)

The National Radio Institute headed by authorities who have been closely allied with government training of students, was established in 1914 and is the first school in America to successfully teach Wireless by Mail. The work is under the direction of J. E. Smith, E.E., director of the Radio Department Howard University, and E. R. Haas, formerly of the Radio Division of Yale University.

We now have students throughout the world. Our location in the Nation's Capital together with the standing of our officers and their wide acquaintance among government officials connected with Wireless activities place us in position to give our students the best instruction obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel and See the World

If you want to travel and see the world —go to foreign countries, and increase your knowledge of world affairs Wireless offers you the chance of a lifetime. However, you are not obliged to travel, but may secure a permanent position at one of the big Land Stations, Railroad, Telegraph, or Steamship Companies if preferred.

Pay As You Learn

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down on our convenient payment plan, and small following payments, often enables our students to earn the cost of their tuition while actually learning to be a wireless operator.

Free Instruments to Every Student

In addition to 5 text books—35 Special Lessons, and 18 Personal Examinations we send you, while taking our course a Standard Automatic Wireless Transmitting and Receiving Set for sending and receiving messages. These fine instruments are Free only to National Radio Institute Students.

Oldest Wireless School in America

In addition to being the oldest and largest Wireless School in America our location in the Nation's Capital enables our Students Employment Department to keep in close touch with the best openings for our graduates. A Post Graduate Course is given Free to every graduate. Special discounts are allowed to discharged soldiers, sailors, and marines with former wireless experience and to Radio amateurs.

FREE

Our booklet "Wireless the Opportunity of Today," gives you complete information in regard to our course, the quick and easy methods by which you can master wireless, and other important facts you should know. It is free. Just mail the coupon. No obligation whatever on your part.

Mail This Coupon Today

National Radio Institute
Department 90
Washington, D. C.

Send me free of charge, your booklet, "Wireless the Opportunity of Today," with full particulars regarding your famous 10 weeks Home Study Course, and your Special FREE INSTRUMENT OFFER.

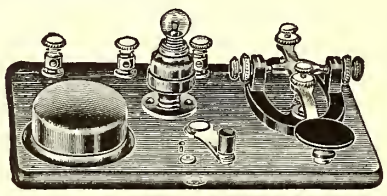
Wireless Receiving Ban Raised

MESCO WIRELESS PRACTICE SET

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

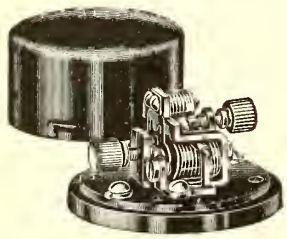


The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

List No.		Price
342	Telegraph Practice Set, with Battery and Cord	$3.24

Weighs 4 lbs. packed.
Price does not include postage.

MESCO Combination Practice Set for Learning the Morse and Continental Visual and Audible Codes



This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord $4.05

Weighs 4 lbs. packed. Price does not include postage.

MESCO RADIO BUZZER

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required.

It consists of practically a closed circuit field of low reluctance, having a steel armature to which is riveted a strap supporting a movable contact. The armature tension is adjustable by means of a screw with a milled head large enough to be easily and permanently adjusted with the fingers. The stationary contact is adjusted by means of a similar screw. The magnet coils are connected in series with a total D. C. resistance of 3.9 ohms. Shunted across these coils is a resistance having a D. C. value of 3 ohms. This shunt eliminates all sparking such as occurs at the break on ordinary radio buzzers and the energy saved thereby is transferred into any oscillating circuit connected to it, the result being that this buzzer as constructed radiates five times more energy than any other existing type. All connecting wires liable to be broken are eliminated. Contacts are of genuine platinum, which is essential in order to maintain a constant note. The parts are mounted on a Condensate base to insure constancy in operation.

Diameter 2 in., height 1¼ in. The cap is attached to the base by a bayonet joint.

List No.		Price
55	Mesco Radio Buzzer	$2.05

We carry a Large and Complete Line of Standard Wireless Material Recognized by Experts as such with Competent Experienced Wireless Attendants in Charge

Send for the New Edition of Our Catalog W28

It is pocket size, contains 264 pages, with over 1,000 illustrations, and describes in plain, clear language all about Bells, Push Buttons, Batteries, Telephone and Wireless Telegraph Material, Electric Toys, Burglar and Fire Alarm Contrivances, Electric Call Bells, Electric Alarm Clocks, Medical Batteries, Motor Boat Horns, Electrically Heated Apparatus, Battery Connectors, Switches, Battery Gauges, Wireless Telegraph Instruments, Ignition Supplies, etc.

INSTALL A NEW GREBE REGENERATIVE RECEIVER In Your Radio Station

Short-Wave Regenerative Receiver Type CR-2

This Receiver is intended for long distance relay work on wave-lengths between 170 and 580 meters and embodies a highly developed circuit employing continuously variable inductances of the variometer type as well as a number of new mechanical features.

Various models designed to operate on wave length ranges from 170 *to* 20,000 *meters are described in our bulletin sent free upon request.*

A. H. GREBE & CO., Richmond Hill, New York

Radio-Planes Watch Forests and Ranches

(*Continued from page* 295)

stations erected about the ranch. The installation and maintenance cost of these stations is relatively small in any case. They have also been so greatly simplified during the war that practically anyone can be instructed in handling the talking and receiving apparatus in a short time. Some of these sets work as simply as the ordinary telephone.

Airplanes and Radio Serve to Protect Nation's Forests.

Recently the use of *airplanes* to patrol the forests and watch for incipient forest fires was extended by the Government and now the *wireless telephone* has been installed for an experimental trial. If found to be practicable the wireless will be extended to cover the great woods with an invisible net of communication.

The wireless is expected to be an improvement upon wires or cables for one very important reason. In the past great difficulty has been experienced in maintaining wire communication in the forests because of the interruption to the service caused by falling timber, especially in the stormy season. Snowslides have been another source of destruction to the wires. The use of wireless, of course, obviates all such difficulties.

For the purposes of the present experiment the Signal Corps of the Army has lent to the Forest Service four combination sets of transmitting and receiving apparatus. One set of the equipment is to be installed on Mount Hood at an elevation of about 13,000 feet, and another at the nearest forest ranger station, about twelve miles away. Two other sets are to be placed in the Clearwater Forest region of Idaho, which is a very heavy wilderness country.

All of the wireless stations will be establisht at *look-out points,* where watch is kept for forest fires, and will supplement the regular service, which not so long ago was augmented by the addition of airplanes for patrol. Now two additional airplane routes for that purpose have been mapt out, both operated from Mather Field, near Sacramento, Cal. The other two routes of the airplane service are operated from March Field, near Riverside, Cal.

The first route from Mather Field will cover the northern parts of the Eldorado and Tahoe forests on the valley side of the Sierras. The planes will start from Mather Field each morning and proceed to Oroville by way of Placerville, Colfax, Nevada City and Strawberry Valley. A landing will be made at Oroville, where a suitable field has been provided. The return trip will be made in the afternoon.

The second route from Mather Field will cover the southern parts of the Eldorado and Stanislaus forests. Starting from Mather Field, the route runs to Placerville, Grizzly Flat, Big Trees, and to a landing near Sonora or Tuolumne. In this case also the return trip will be made in the afternoon. Each of the Mather Field routes has a round-trip length of about 150 miles.

Forest Service reports tell of a successful trial patrol undertaken recently under test conditions. No difficulty was experienced in detecting fires in heavy timber at elevations of from 6,000 to 10,000 feet.

Peculiar interest attaches to the movement for conservation as affecting North Carolina, Tennessee and Kentucky because of the potentialities involved.

NEW SUBSTITUTE FOR PLATINUM.

The question of substitutes for platinum has received almost world-wide attention, many nations having been obliged to devise something. Most of the platinum came from Russia before the war. Germany was no exception. Some of the recent substitutes are enumerated in a German paper. The most important seems to be that suggested by Gotthold Fuchs, of Berlin, consisting of a wolfram-gold-nickel alloy which can be cast, forged and rolled, is of light color and polishes brightly, which platinum does not. Another substitute is an alloy of silver, wolfram and nickel. Both these alloys are stated to be acid resisting. A nickel-iron alloy, known as platinit, is said to be serviceable as a substitute for platinum in glow lamps, its coefficient of extension being similar to that of glass. For laboratory purposes an alloy of nickel and chromium affords a platinum substitute for wire and sheets, but cobalt alloys, such as cobalt-iron and cobalt-chromium are as serviceable, especially for acid-resisting purposes.

Peacetime Uses for War Inventions

By H. Winfield Secor

(*Continued from page* 298)

The illustration in Fig. 7 shows two applications out of many for the once busy *U-boats*. America and the other Allied countries can make use of all the superfluous U-boats without a doubt. For exploring the *flora* and *fauna* of the undersea regions they are ideal. They can be fitted with powerful electric projectors, observations lenses and windows, when not only can visual observations of the deep sea life be studied, but even motion pictures can be taken. And for pleasure trips at the seaside resorts—I would hate to have the job of figuring up how many five dollar bills one could rake in, in a single Saturday afternoon, with one of these pleasure submarines at Coney Island, not to mention the Beach at Coronado, Calif., and who would not like to explore the secrets of the Great Lakes? We have heard of the chap who endeavored to dash over Niagara Falls in a rowboat, and no doubt we shall soon hear of the enterprising fun-promoter, who will, for a consideration of $25.00 or so, invite you for a trip over Niagara in one of the former Kaiser's plush upholstered U-boats. Plush upholstered is right, and we would like to have it about nine feet thick.

In order to attract the sea and lake fishes for the edification of the passengers aboard, we can imagine that some genius will roll up his sleeves and get busy developing a "food gun" which can be attached to the torpedo tube. Presto! Push the button and out flies a perfect barrage of fishsome dainties for our piscatorial neighbors, when they will come bounding forward in great flocks, much to the delight of the submarine's guests, snapping their teeth gladly and otherwise showing how delighted they are.

The *Submarine Detector,* which is shown in Fig. 8, and which was wonderfully perfected during the World War, should find many peacetime applications, particularly on all ocean-going and inland lake vessels for the purpose of locating other vessels in a fog or at night, and also for accurately locating the presence of icebergs and reefs. The submarine detector, of which several different types were developt during the war, operates on one general principle, that of *sound wave transmission thru the water.* The sound produced by the propeller and driving motors or en-

BRANDES WIRELESS HEADSETS

Score 100% efficiency in actual use

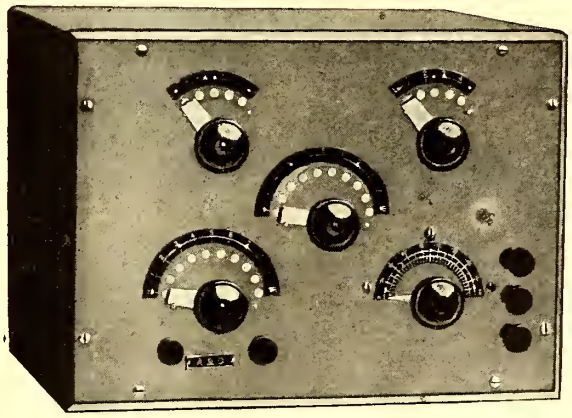
"Superior" Set $6.

CLEAR IN TONE — LIGHT IN WEIGHT — DEPENDABLE IN SERVICE

Sharp, unblurred, readable signals assured by

"BRANDES MATCHED TONE"

We achieve this by perfectly matching the tone of both receivers in each set. This eliminates all confusion to the ear due to unmatched harmonics.



YOUR RECEIVER IS **RIGHT** IF IT'S A "BRANDES".
Used by many U. S. Gov't experts, and experts abroad, by colleges and technical schools, and by professionals and amateurs everywhere.

TRIAL OFFER—Brandes Wireless Headset sent to you on trial for 10 days. Test it; compare it with others, for sensitiveness, clearness, distance. Prove for yourself the fine quality, the "matched tone". The two diaphrams, toned exactly alike, strengthen the signals and prevent blurring. If, for any reason, you are dissatisfied, your money back without a question.

UNIVERSAL RADIO APPARATUS

Type UL-5 Receiver

It is the policy of this company never to consider a sale completed until the customer is thoroughly satisfied. Incidentally our instruments seldom fail to satisfy, because they are scientifically designed and built on honor. If you are interested in radio apparatus of the highest grade at fair prices, enclose a 2-cent stamp for our catalogue.

Type UL-5 Receiver.

This is a complete receiver for undamped waves up to 17,000 meters. No external coils, couplers or condensers are needed, since it is entirely self-contained. Sizes 8" x 12" x 7" approximately.

We control the patent rights for the Mignon System and can supply these instruments.

PROGRESSIVE RADIO APPARATUS

To what reasons can the popularity of De Forest Radio Apparatus be attributed?

Is it because of its consistent performance, excellent workmanship, materials, low prices?

These would account for it partly. The real reason must lie in the fact that we have always been in the van. Design and system employed have been so far in advance of others as to overshadow our rivals.

The De Forest Company is one of the recognized successes in the radio field. Our success has been progressive—more than merely financial, because we give better service—more for your dollars—most modern apparatus—than you can obtain elsewhere.

We do not aim to sell the most radio apparatus—only the best. Quantity is a secondary consideration.

We were the first to produce the audion amplifier and the oscillion undamped wave transmitter, and its popularity is attested by its wide use.

Our latest productions, the Honey Comb Coils, Unit Set, Coil Mountings, Two Step Amplifier and Audion Control Box have been greeted with enthusiastic demand far exceeding our expectations.

The Unit Receiver fills the demand for a really efficient receiver for any and all wave lengths of any preferred circuit and design without the usual costly cabinet and expensive assembly.

We have been literally swamped with orders, so do not feel surprised when your dealer tells you it will be necessary to wait a few weeks before you can get delivery.

By placing your order now you will avoid the greater congestion in our factory when the purchasers of this meritorious apparatus of novel design begin enthusiastically recommending it to their friends.

DE FOREST RADIO TEL. & TEL. CO., 1415 Sedgwick Ave., New York City

Faradic Currents—How To Apply Them

(*Continued from page* 318)

eight minutes or at the outside fifteen minutes is long enough for a treatment. The exceptions to this rule are in the treatment of some chronic diseases, as chronic articular rheumatism, etc., and in general electrizations, where a little longer time might be allowed.

No definite rule holds as to the frequency of sitting, as much depends upon the nature of the disease, the sex, age and habits of the patient. Some acute cases require daily sittings, seldom more than that. In chronic cases from two to four times a week may be enough.

Constipation

Connect the rectum electrode to the *negative* pole of the battery and place it in the anus. At the same time the *positive* over the stomach, liver and bowels. Use the *secondary* current. A small internal dose of cascara sagrada will sometimes prove beneficial. However, the use of cathartics, as a rule, is not advisable, and the above treatment is much better without them. Eat good plain digestible food. A dish of oatmeal and milk eaten in the morning will help to regulate the bowels.

Corns.

Place the foot upon the foot plate, it being attached to the *negative* pole of the battery and apply the *positive* pole directly to the corn, using a small piece of sponge fastened to the ear electrode. Treatment should last about ten minutes daily. Use the *primary* current.

Canker.

This is caused by indigestion. Let the patient live upon a light milk diet for a few days. Thoroly wash the mouth and throat frequently with borax or boracic acid diluted with water. Electrical treatment: Place the *positive* at the nape of the neck on the spine and apply the *negative* to the stomach. This treatment should last about ten minutes. Use *secondary* current. Another treatment is to place the tongue electrode in the mouth having previously attached it to the *positive* pole of the battery and apply the *negative* to the neck and throat. Use *primary* current. A general tonic treatment two or three times a week will be beneficial.

Diabetes.

Diabetes seems to be a nervous disease, and for that reason we recommend what is called *Central Faradization*. The object is to bring the whole central nervous system under the influence of the primary current. Place the *negative* pole at the pit of the stomach and pass the *positive* over the head and forehead, down the back of the neck and along the whole length of the spine. Use a very light current about the head and increase gradually. Do not apply the current to the head more than one or two minutes at a time. The spine will stand a much stronger current than the head. The back may be treated about five or six minutes. After this give tonic or general treatment for ten minutes, with the *secondary* current.

Death—Apparent.

People who have to all appearances been dead, have been restored to life by electricity. The test is as follows: Place the sponge electrode (*positive* pole) to the back of the neck, and apply the *negative* to the body over the lungs and heart. A mild *secondary* current is first used, gradually increasing it until the patient shows signs of life. Keep this treatment up for about five minutes, also apply the *negative* electrode to the arms, wrists and hands. Now sponge the whole body with the *nega-*

DESTROYER FLOTILLA NAVIGATED 1,100 MILES BY DIRECTIONAL WIRELESS.

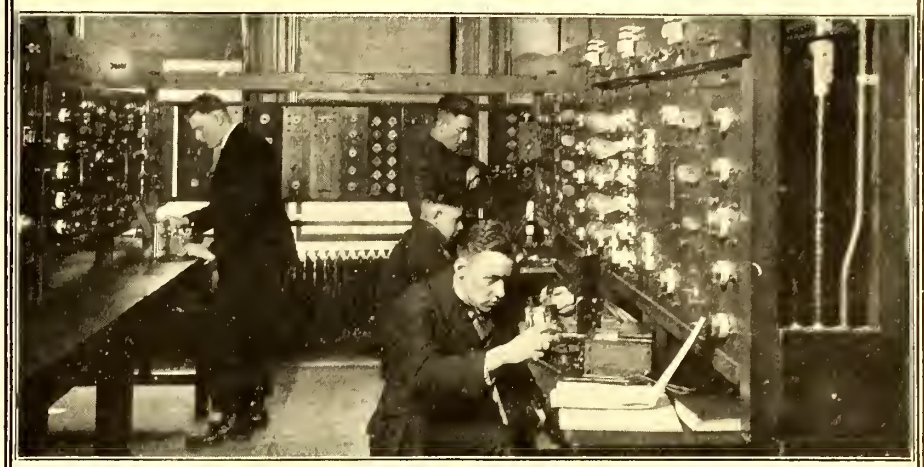
Seven links in the chain of naval destroyers stretched across the Atlantic by the United States Navy for its transoceanic flight reached their Newfoundland base after traveling from New York enveloped in fog from Fire Island to Trepassey Bay, thus navigating 1,100 miles entirely by directional wireless, with which the Transatlantic seaplanes were equipt. The trip was said by Captain Arthur Crenshaw, base commander, to have been one of the severest tests this means of navigation ever had. The destroyer Philip became separated from the flotilla in the fog, but she entered the harbor soon after her companions.

To War On An American Destroyer

By A. H. Whedon

(Continued from page 329)

Of course, a certain amount of roll and pitch is to be expected—but a destroyer of a very nervous disposition just can't be still at all!



The largest roll that we made while I was on the *Conyngham* was seventy-two degrees to starboard and sixty-eight to port. That is in the ship's log, and signed by the Captain. And, friends and fellow citizens, I maintain that *that* was sure *some roll.* Try it once and see. A destroyer is always rolling at sea, and in a storm she is one great "dance artist."

The *radio shack* is mounted either way forward or way aft, in the place most calculated to get the benefit of the rolling and pitching. Of course, it is superfluous to mention the fact that everybody from the oldest salt down to the newest rookie gets sea-sick on the first trip to sea on a destroyer. The rookies come aboard expecting to be sick. But when a "gob" wise in the ways of ships (big ones) comes aboard, he proclaims for all to hear that he has been going to sea too long to get sea-sick. The day comes when we go to sea. The next day friend "gob" fails to rise for breakfast—not that he is sea-sick or anything like that, y' understand, but simply that last night's chow must have disagreed with him. By noon time he joins the rest of the gang at the lee rail, actively engaged in the sport technically known as "feeding the fishes." Yea, verily, 'tis a great life until you get used to it. And nine-tenths of the sailors get so that the more she rolls, the better they like it.

But now consider the case of the poor radio man, who is forced to sit for at least four hours before his set, never getting up from his chair and never taking his receivers off. Every time the ship takes a big roll he rolls with it, unless his chair is screwed to the deck—but they never are—and there is a wild scramble to hold on to pencils, pads, code books, and other loose articles that have a tendency to hide under power transformers, switchboards, or any other place where it is deuced hard to recover them.

At the first calm spot, the "op" nervously attempts to readjust his detector, and succeeds in making things worse. So he shifts over to the audion and thinks his troubles are over. So they are until he discovers that the filament battery is run down and needs recharging. Then follows a choice line of briny "cuss" words. About this time the boat decides to take another roll, and the show starts all over again.

In between times, the "op," if he is new on a destroyer, realizes that he really isn't feeling well. Then he begins to wonder why he ever joined the Navy anyway. Of course, he can't leave his post to join

ONE OF THE SEVEN LABORATORIES

AT THE SCHOOL OF ENGINEERING OF MILWAUKEE

Where ELECTRICITY Is Taught Quickly And Thoroughly

Become an Electrician in One Year

or learn an electrical trade in six months. Greatest of all professions open to you. "Forty billions will be invested in Electricity in next five years," says Edison. Salaries are high. Demand for TRAINED electricians ENORMOUS. Think of electric lighting, electric street cars, electric railway trains, electric telephone and telegraph, electric motors, electric automobiles, electric cooking and heating. Electricity in the air and under the sea. Is it not dazzling?

Field Limitless—New—Uncrowded

Our forty professors of the three departments teach the laws and principles of electricity. Actual training in laboratories; lectures and problems. No special schooling required to enter our practical electrical, electrotechnician and trade courses.

"Earn While You Learn" if you wish. We arrange half-time employment that will help you defray expenses. Athletics, Glee Club, Lakeside Advantages. Board and Room at Students' Fraternity House at cost.

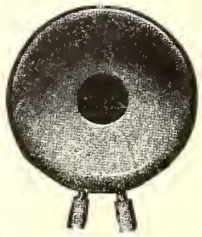
AMPLIFY YOUR RADIO SIGNALS

With the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.



The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH-TRANSMITTER to the regular wireless receiver.

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter. It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

SUPER-SENSITIVE Detectagraph MICROPHONE DEVICES

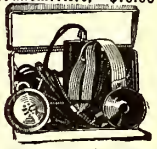
Our Super-Sensitive Detectagraph Transmitter. Price, $7.00 Complete

Our Special No. 25 Loud Talking Receiver. Price, $4.00 Complete

Detectagraph Rheostat, especially made for amplifying circuits. Price, $2.00 Complete

Super-Sensitive No. 40 Receivers to be used in connection with Detectagraph-Transmitters, $10.00

The Detectagraph Junior Deaf-Phone $15



Equal to any $35 instrument made. Outfit consists of Super-Sensitive Transmitter with cord connector; Super-Sensitive Ear Piece with small black cord; Black Single Headband; Black Case and Two Batteries.

Model "B" Horn, with Loud Talking Receiver, Cord Plugs and Desk Stand Base. Price, $10.00 Complete

Model "C" Horn, with loud talking Receiver, Cord Plugs and Wall Base. Price, $10.00 Complete

Detectagraph $15

This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25-ft. Black Cord, Receiver, Headband, Case and Battery.

his friends at the lee rail, but he must do something—quickly!! Ah—he grabs somebody's tin pail that is lying around, which is used to wash in. But friend "op" is not standing on ceremony, he wants action, and quick action—and he gets it!

The radio shack on the *Conyngham* was an inside room, and had no port-holes or other openings on deck. In order to provide for good ventilation, a small air vent was installed in the overhead of the radio room, leading out on deck. It was put in hastily, and was far from being watertight. When we hit a storm and the waves broke over the deck, lo! much "moisture" used to descend into the radio shack. In vain I pleaded with the ship's carpenter, and with tears in my eyes I begged him to fix that "gadget." But he was always doing something else. So I tried to see what I could do to it. When I got thru, it didn't leak, it poured! I had completely broken it. But I was triumphant. Now it would *have* to be fixt.

But we put to sea with the blame thing still busticated. It was the middle of December, 1917, and, for a change, the sea was unusually calm. Everything was all ski for two days, till we met the U. S. S. *George Washington* and the U. S. S. *Huron* to be convoyed into Brest. (This was before the *George Washington* became the Presidential ferryboat. Then, suddenly, all the furies of the sea and heavens turned loose. Everyone who was at sea in that part of the ocean will remember that storm to their dying day. For two days and nights we headed into it and gained but forty miles! Ordinarily the destroyers would have ridden it out with the storm instead of against it. But we had fifteen thousand U. S. soldiers to guard, and we stuck—! At last, even the troop-ships could stand it no longer, and we got a signal from the *George Washington* to "countermarch." That is, turn around and go with the storm. All that night we just drifted, taking things easy, and the next morning the storm had subsided enough for us to try to make port. There were times during those awful two days and nights when even the captain on the bridge remarked that we would never live thru it. And in the face of his belief, he refused to leave the troop-ships to the tender mercies of a stray submarine, for while no "sub" could work during the storm, there was bound to be a calm spell afterward when we would be needed. So we stuck—!

We finally reached port, but what a mess our division was! Of course, everything was absolutely swept clear of the decks. One destroyer even had a smoke-stack carried away, and another one had her main mast broken off. The *George Washington* had lost most of her life boats, and eight men had been washed overboard. The *Conyngham* escaped with very little damage. All our compartments were flooded, and of course there was nothing left on our deck in the way of sea chests, the carpenter's bench, etc. AND the radio shack! Just drift back a few lines to where I mentioned the broken ventilator and then on down further where I mentioned the storm. Two and two never made six—so you can imagine what our radio shack looked like. I had a young Atlantic Ocean in there—six inches of water rushing all over the deck and having a fine time playing with the power transformers and the Leyden jars, with *ye scribe* perched up on the desk, soaking wet and wondering who started this war.

And so it goes—as someone once remarked—"If we had some ham, we'd have some ham and eggs—if we had the eggs, ——etc." For those that like it the Navy is sure a fine playground, but personally I am better satisfied to sit here writing this short reminiscence in order to win a few extra pennies for a new pair of shoes for the baby!

A Review of Radio-Telephony

(Continued from page 326)

from the Western Electric Company Engineering Organization to engage in this work. At this time plans were in the making for the tremendous aircraft program which was later undertaken by the Army, and it was clear to all that a successful means of communication between battle planes when flying in squadrons would be of inestimable value and would greatly increase the efficiency with which these squadrons could be maneuvered. The early work had shown such promise that there was justification for assuring the Signal Corps that this means of communication could be worked out successfully and applied to aircraft of various types. As a result of this conference, orders were issued by the Signal Corps for the Western Electric Company to undertake the development of a wireless telephone system for the purpose.

The problem now was to produce sets of minimum size and weight, physical structures which would withstand the extreme vibrations and jars encountered in flying, especially in landing, the most convenient disposition of control elements, suitable sources of power for both high and low voltage, and a form of antenna which would not interfere with the evolutions of a plane in squadron formation.

It was realized that the solution of the last mentioned problem would consume more time than was at our disposal, and while work was immediately started in the field on antenna measurements and study, the design of the sets proceeded on the basis of using a trailing wire antenna.

The working out of a practical helmet design proved to be more difficult than the success of the earlier experiments indicated. It was found that the degree of interference experienced changed very rapidly with slight imperfections in fit. The problem was also complicated by the necessity of providing means for using oxygen at high altitudes, and of providing for the comfort of the wearer over a period of several hours. It was found that a very slight amount of pressure on certain portions of the ear caused excessive pains and headaches after a very short period, and the final design was a compromise between comfort and efficiency as to sound insulation.

The problem of power supply was an interesting one. It was required that the weight should be reduced to a minimum, which precluded the possibility of employing storage batteries. There are obvious objections, also, to attaching any form of generating device to the propelling engine. Consideration of all the factors led to the adoption of a wind-driven generator for the purpose. This generator of about 100 watts direct current output was required to produce a potential of 300 volts for the plate circuits of the vacuum tubes, and a potential of 25 volts for the filament circuits. It is necessary, to insure most efficient operation, that the filament current be kept constant, and the fact that the specifications called for operation with airplane speeds varying from 40 to 160 miles per hour made the problem of voltage regulation loom large. Ordinary forms of electro-mechanical regulating devices did not prove to be successful, and while it was probable that something of this type would eventually have been developed, the problem was solved by a very ingenious arrangement proposed by Mr. H. M. Stoller, in which the vacuum tube is the essential element. The voltage of the generator is held approximately constant by means of a vacuum tube regulator, which controls the field flux. Two field windings are pro-

This book contains a list of high power Radio Stations of the world with wave lengths they transmit on—a list of stations sending press—time—Q signals—tables for finding charges on radiograms—data on American, British, Canadian, and French Radio Compass Stations, in addition to the

Wireless Calls of Over 9000 Ships and Shore Stations

In fact this publication is so *complete and up to date* that large radio companies have contracted for copies for their ships. Since our advertisement in the last issue we have received and tabulated so many additional Radio calls that it has been necessary to raise the price of the book. Price, $1.00.

Orders postmarked prior to August 1st will be accepted at the old price of 75c.

vided, the main field, which is in series with the filament of the regulator tube, and a differential field which is in series with the plate circuit. At minimum speed the differential field is inactive and the generator behaves like an ordinary shunt machine, except that the main field has a small resistance in series due to the regulator tube filament. This filament is so designed that the main field current heats it to a temperature which gives a small electron current. This current flows thru the differential field and reduces the resultant flux. At minimum speed, the differential current is small, but as the speed increases, the main field current tends to rise (as in any shunt generator) and this increases the temperature of the regulator tube filament. The electron current is, therefore, considerably increased, which current, flowing thru the differential field, reduces the generator flux and thus restricts the rise in voltage. Due to the fact that the electron current of the regulator tube increases very rapidly with increase in filament current, the voltage is held practically constant between 4,000 and 12,000 revolutions per minute. The 1.5-ohm resistance units are provided so that the regulator may be set to give different voltages by cutting them in or out of the main field. The 100 ohms shunt resistance is used to prevent hunting.

Upon the completion of the next set of models, field tests were resumed and on August 20th the first two-way telephone conversation between two planes in the air was successfully accomplisht. After this first trial, Major Bartholf and Lieutenant Stevens, of the Signal Corps, held two-way conversation between planes with very satisfactory results.

Late in 1917, the type of airplane set shown in Figs. 4 and 5 was installed on our airplanes. The various parts are arranged so that they can be mounted in any available space in the machine. The switch box shown in the diagram is to provide for communication between pilot and observer by means of the same microphones and helmets used in radio-telegraphy. The transmitting and receiving set proper is shown in Fig. 4. This set is 17x10x7 inches and weighs but twenty-one pounds. The generator is of the wind-driven type, and is shown in Fig. 6 with the tail cover removed giving a view of the vacuum tube regulating device. The complete weight of the entire outfit is about fifty-eight pounds. Fig. 7 shows a simplified form of the circuits.

The last distinctive type of radio-telephone outfit is the short wave set installed on submarine chasers and destroyers during the war. These sets are shown in Figs. 9 and 10. The circuits of these sets are practically the same as for the airplane sets, except that the power for them is obtained from small dynamotors run on a 30-volt storage battery. The complete transmitter and receiver, together with the amplifier and extension set, are shown in Fig. 8 and the transmitter receiver itself is shown in Fig. 9.

The set is installed in the radio room with the amplifier for the loud-talker. An extension set consisting of a telephone transmitter and receiver, together with the loud speaker, is mounted in the pilot house. By means of a switch in the radio room, the operator can cut in the extension set while the conversation is being carried on by the captain. It is also possible to use either the head receivers or the loud-speaker for receiving.

This equipment has an effective range of from 5 to 10 miles and can be used in four wave lengths ranging from 250 to 600 meters.—*From a paper by E. B. Craft and E. H. Colpitts, entitled "Radio-Telephony," read before the American Institute of Electrical Engineers, Feb.* 21, 1919. *Photos courtesy Western Electric Co.*

www.americanradiohistory.com

Faradic Currents—How To Apply Them

(Continued from page 366)

tive while the *positive* electrode is at the base of the spine. The room should be well aired, and the patient's feet and hands should be kept warm with hot water and bags.

Headache.

The treatment of headaches depends upon the cause. If caused by disordered stomach or bowels, what is called a sick headache, place the *positive* electrode at the base of the brain and apply the *negative* over the stomach, liver and bowels, using a *mild secondary* current. General tonic treatment of the whole body with *secondary* current will cure or help some patients, while central faradization (as described in treatment of diabetes) will help others.

Indigestion.

Place the *positive* at the back of the neck and sponge the region of the stomach and bowels with the *negative*. Another method is to place the *positive* electrode on the tongue and the *negative* at the pit of the stomach. Use *secondary* current. If the patient is debilitated give general tonic treatment of the whole body.

Neuralgia.

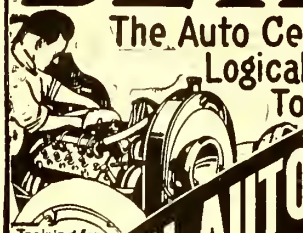
If properly treated, neuralgia is one of the diseases that yield most readily to electrization. There is one difficulty in the treatment of neuralgia by electricity and that is the intensity of the pain. Often the first few treatments aggravate the pain, especially if the current is too strong or the treatment is continued too long. Not over one treatment a day should be given. Give a general tonic treatment of the whole body every other day. For local treatment, where there is no swelling, apply the *negative* to the painful parts, and the *positive* at the hands or feet. If there is swelling apply the *positive* to the disease, and the *negative* at the hands or feet, using a *secondary* current.

Rheumatism—Inflammatory and Acute.

Either of the above kinds of rheumatism may be treated with the *positive* electrode. If the trouble is about the head, neck, arms or shoulders, hold the *negative* in the hands and apply the *positive* to the painful parts. If the pain is below the arms, apply the *negative* electrode to the feet and the *positive* to the affected parts. Drink freely of lemonade. Avoid alcoholic liquors, meats and fatty food. A rigid diet for a few days is to be recommended.

Rheumatism—Chronic.

Chronic rheumatism is much more obstinate and resists a cure more than the acute kind. Very often the general tonic treatment will give relief. For local treatment, treat with the *negative* electrode instead of the *positive* as in the acute form. Also use the primary and secondary currents alternately. If the joints are enlarged treat with the *positive* electrode, using the primary current. Keep the body warm and the feet warm and dry. Do not allow the patient to expose himself to any dampness. The electric bath is to be recommended.



Sunstroke.

In most cases of sunstroke, electricity is a valuable agent in restoring persons who have been overcome with the heat. General tonic treatment should be given, also central galvanization as described in the treatment of diabetes. Local treatment to the head may be given and a *very light secondary* current should be used, *positive* electrode at the head and *negative* at the base of the spine. In all cases have the attention of a good physician.

DETROIT

The Auto Center is the Logical Place To

LEARN AUTO AND TRACTOR BUSINESS

Training for Head and Hand

Trained men are needed everywhere to test, repair and give expert advice on care and handling of automobiles, trucks and tractors. Big money for M. S. A. S.-Detroit trained men. Good jobs or independent businesses await our graduates. Opportunities unlimited.

Earn $100 to $400 Monthly

Our Course will teach you how in a few short weeks. Most complete, comprehensive and up-to-date Course known. Wholly practical. No job too hard for our graduates. Every phase of work covered. Actual experience given on dozens of different cars. Entire equipment best obtainable. Instruction includes complete Tractor Course. Brazing, Welding and Tire Repairing taught separately.

Learn in Detroit — Start Any Time — Our Graduates in Demand Here you get the benefit of finest co-operation of biggest factories. They know the thoroughness of our Course and gladly help our students in every way possible. Almost daily we have calls for graduates to fill responsible positions. School open all year. Enter classes any time. No need to waste or lose a moment.

Money-Back Guarantee We guarantee to qualify you for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, automobile dealer, or tractor mechanic and operator, paying from $100 to $400 monthly, or refund your money.

Big Factories Endorse Our School

They know what we do—how we teach, and the type of graduates we turn out and give our students unusual assistance. Every instructor an experienced man—one who knows and is able to teach others.

KING MOTOR CAR COMPANY

BUILDERS OF KING CARS — DETROIT, U.S.A.

ARTEMAS WARD JR.

Replying to a recent letter addressed to Mr. Artemas Ward making inquiry as to the reputation of the Michigan State Auto School, will say that as far as I know all Detroit Automobile manufacturers endorse the work they are doing.

It is managed very efficiently and they have been turning out some pretty good men for the automobile industry and cannot see any reason why you should hesitate about taking a course with this institution.

Yours very truly,
KING MOTOR CAR COMPANY

County Agents *Here's Your Chance* The 1919 Models are **BIG VALUES**

THE **BUSH**

5-Pass. 4-cyl. Touring
5-Pass. 6-cyl. Touring

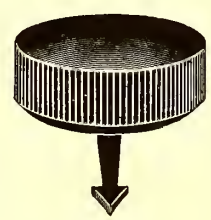
4-cyl. Lycoming Motor—37 H.P.
6-cyl. Red Seal Motor—40 H.P.

For nearly five years the Bush Car has been doing heavy duty all over this country.

It's sold through County Agents only—we do not have distributors.

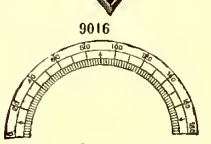
County Agent's Proposition is liberal beyond your expectations.

Get all the information quick. Write at once to J. H. Bush, Pres., Dept. H-15



BUSH MOTOR CO.
Bush Temple, Chicago

The Bush Car for 1919, both in the Light Four and Light Six, are unequaled in value anywhere this year. Think of a car with all the modern refinements which includes in its equipment the Boyce Motor Meter at prices modest in the extreme. The Bush method of marketing the Bush Car not only gives the County Agent a better profit than he usually gets but the Bush method of sales gives the user the benefit of high quality at low price. We list below some of the big things—the high grade features—that go into the Bush Car for 1919. These are the things that make a real car.



Full Floating Rear Axle	37 H. P. 4-cyl. Lycoming Motor
Two Universal Joint Drive	40 H. P. 6-cyl. Red Seal Continental
116-Inch Wheel Base	Refinement in Body Finish
Copper Radiator	Plate Glass Rear Windows in Top
Electric Lighting and Starting (2 unit)	Deep French Pleat Upholstering
Willard Batteries	Extra Leg Room in Body
Timken Bearings Throughout	Light Weight—2450 lbs.

The Bush Car is not a twelve months or less proposition. It's not ready for the scrap heap after a year's use. The best material obtainable—the very highest quality construction coupled with what every one knows to be good equipment, such as Willard Batteries and Timken Bearings, insures a long life to the Bush Car even under unusually hard service.

There is a Money Back Guarantee Goes with Every Bush Automobile to show you we mean just what we say about the quality of this car and to prove to you that your confidence in us will not be abused. Our Guarantee is in writing.

What 15c will bring You from the Nation's Capital

Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.

The little matter of **15c** in stamps or coin will bring you the Pathfinder **13** weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation; a paper that prints all the news of the world and tells the truth and only the truth; now in its **26th** year. This paper fills the bill without emptying the purse; it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send **15c** to show that you might like such a paper, and we will send the Pathfinder on probation **13** weeks. The 15c does not repay us, but we are glad to invest in new friends. **The Pathfinder, Box 576, Washington, D. C.**

WIRELESS CONTROL IN THE PEACE TREATY.

Wireless: During a period of three months after the peace German high power wireless stations at Nauen, Hanover, and Berlin will not be permitted to send any messages except for commercial purposes, and under supervision of the allied and associated Governments, nor may any more be constructed.

Cables: Germany renounces all title to specified cables, the value of such as were privately owned being credited to her against reparation indebtedness.

Germany will be allowed to repair German submarine cables which have been cut, but are not being utilized by the allied powers, and also portions of cables which, after having been cut, have been removed, or are at any rate not being utilized by anyone of the allied and associated powers. In such cases the cables, or portions of cables, removed or utilized remain the property of the allied and associated powers, and accordingly fourteen cables, or parts of cables, are specified which will not be restored to Germany.

Air: The armed forces of Germany must not include any military or naval air forces except for not over 100 unarmed seaplanes to be retained till Oct. 1 to search for sumbarine mines. No dirigible shall be kept. The entire air personnel is to be demobilized within two months, except for 1,000 officers and men retained till October. No aviation grounds or dirigible sheds are to be allowed within 150 kilometers of the Rhine, or the eastern or southern frontiers, existing installations within these limits to be destroyed. The manufacture of aircraft and parts of aircraft is forbidden for six months. All military and naval aeronautical material under a most exhaustive definition must be surrendered within three months, except for the 100 seaplanes already specified.

POCKET WIRELESS SOON, PREDICTS MARCONI OFFICIAL.

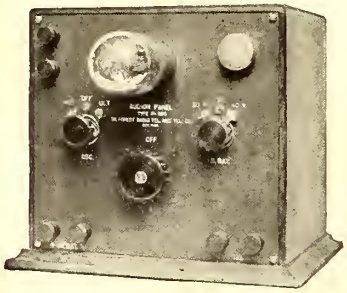
Godfrey Issacs says the English Marconi company, of which he is managing director, expects to have a commercial service of wireless telephones in operation in New York and London early next year.

The company hopes to make arrangements with New York and London telephone companies so that eventually the British and American wireless 'phone subscribers will be able to sit at their desks and "Hello, London" or "Hello, New York."

Isaacs foresees the day, not far distant, when pocket wireless telephones will be in wide use. A business man's secretary, walking along the street, Isaacs says, will hear a bell ring in his pocket, will put a receiver to his ear and hear "his master's voice" give him instructions, probably from an airplane hundreds of miles away.

The Daily Mail says that the British government probably will compel all commercial airplanes and airships to carry wireless telephone or telegraph equipment. Larger machines of both types may be compelled to carry both.

BULLARD ONCE AGAIN RADIO DIRECTOR.



Navy orders were issued April 9th, reappointing Rear Admiral William H. G. Bullard as Director of Naval Communications, a position he held at the time the United States entered the world war, but from which he was detached for service overseas.

Rear Admiral Bullard is an honorary member in the Radio League of America, as our readers will remember.

AMAZING AUDION DETECTOR VALUES-$9.50 $11.75 $18.85 $22.00

Remarkably efficient and handsome audion control panels within the price limit of **EVERY AMATEUR, BUILT AND DESIGNED FOR THE AUDION, AS ONLY THE MAKERS OF THE AUDION CAN BUILD IT.** IN THE PAST, INSTRUMENTS OF THIS CALIBRE HAVE NEVER BEEN OFFERED AT TWICE THESE PRICES.

GENERAL SPECIFICATIONS, ALL MODELS: Beautifully engraved and grained genuine bakelite panels; 4 prong heavy nickeled tube receptacles; smooth running, positive acting, adjustable rheostats; impregnated efficient mica stopping condensers; adjustable or fixed grid leaks with polished nickel covers; bakelite covered binding posts with new slotted positive connecting feature; positive segmentally connected nickel plated switches; 40 volt B battery of two 20 volt type units cast en block with operating life of 6 to 12 months—a remarkable advance in B batteries; handsome quartered oak cabinets, round corners, standard de Forest "Early English" finish; perfect workmanship and expensive design throughout.

TYPE P500—$22.00

Type P-400 Audion Panel—Consists of tube receptacle, grid leak and condenser, rheostat and binding post for connection to tuner, A and B batteries on bakelite panel 7½" x 7½" without cabinet and B batteries.....$9.50

Type P-401 Audion Panel—Same as above with cabinet, $11.75

Type P-402 Audion Panel—Larger panel with 40 volt B battery in cabinet.....$18.85

Type P-500 Audion-Ultraudion Panel—Type P-402, Panel with two switches for audion-ultraudion connection and either 20 or 40 volt B battery in cabinet.....$22.00

TYPE P401—$11.75

NOTE: All de Forest audion apparatus is sold without the tubes. Audion detector oscillator or amplifier tubes, $7.00 each additional. Catalog sent on receipt of 10c in stamps to cover postage.

Heat Engines

By John J. Furia

(*Continued from page* 320)

utes at the beginning of the day and the steam pressure is controlled automatically. Kerosene is used as the fuel which is considerably less expensive than gasoline. No shifting of gears is necessary. A turn of the throttle will give enough steam to climb any hill or to slow down to a crawl. No fussing with carburetor or ignition systems. The spent steam is condensed and led back to the boiler so that a much smaller water supply tank is used. No cooling system is necessary. A pilot light using up a negligible amount of fuel keeps enough steam pressure all day, so that one can make an immediate start. All gages operating on the fuel and steam are automatic, thus eliminating all danger. Why is it then that we do not see many of these steam cars. Two reasons—it takes a long time to educate the public—steam cars cannot be kept in the present public garages, since the open flame of the pilot light is liable to ignite the gasoline vapors present in all garages and cause fire. No doubt the steam car has a great future (provided the oil companies do not boost the price of kerosene).

The Hot Air Engine.

The *hot air* engine uses neither gasoline nor steam but plain ordinary air and that is pretty cheap. Let us examine the principles of its operation. Figure 3 shows an ideal engine consisting of a cylinder, piston, connecting rod, and fly-wheel. Heat is applied to the lower end of the cylinder as in A, the cylinder being composed of non-conducting material, except the bottom which is a good conductor. The heat will cause the air in the cylinder under the piston to develop great pressure and *eventually to expand,* forcing the piston *upward.* If the heat is suddenly removed and replaced by cold, when the piston reaches the top of its upward motion, then the air under the piston will *contract* and the piston will move *downward,* due to two causes: (1) the suction under the piston and (2) the pressure from above the piston, since the air above the piston was comprest when the piston moved up. This then would constitute the complete cycle and if repeated indefinitely our engine would continue to run. Let us look at Fig. 2 again. If the inlet were connected to a tank of air and the air heated, the air would expand, enter the cylinder and move the piston; if then new air were admitted and heated, this on expanding and entering the cylinder from the other side, because of the action of the slide valve, would cause the piston to move back again, giving us a motion similar to that of the steam engine.

The ideal hot air engine described above and this steam engine operated as a hot air engine, illustrate the two types of hot air engines in existence. The first typifies the *closed cycle* engine which operates continuously with the same mass of air (a fresh charge being occasionally admited to compensate for leakage). The second typifies the *open cycle* in which a new charge of air is admitted and exhausted at each stroke. The closed cycle engine is analogous to the new type of steam engine employing a condenser for the spent steam, while the open cycle is analogous to the old type non-condensing steam engine. Therefore it is readily seen that the closed cycle engine is more efficient than the open cycle, none of the fuel being wasted on the exhausted air. In all types of *hot air* engines, the power is secured by the pressure of the air produced by heat transferred by a separating metal wall. The air is admitted to the cylinder at a high temperature and pressure, it is allowed to do mechanical work on the piston as a result of which the pressure and temperature fall off.

There are two heating systems employed in hot air engines—the *regenerative* and the *non-regenerative.* A regenerative system is one which uses a device for absorbing the heat from the air as it passes in one direction and supplying it again on passing in the opposite direction. A non-regenerative system does not employ such a device. One of the best of the hot air engines is the Stirling engine which has been actually used commercially, tho without much success. It is of the closed cycle type working with a constant volume of air, and requires about 2 lbs. of coal per hour horsepower (i. e., more efficient than the steam engine). Its chief objection was that the heating plate, which takes the place of the boiler of the steam engine, burned out rapidly. Figure 4 is a sketch of the essential parts of the Stirling engine. C is the brick foundation of the engine, B the fire box, A the draft, H is the working cylinder, E the displacer acting in opposition to the working piston, D the air-box, F metal gauze, and G coils of pipe thru which cold water flows. The total volume of the air contained in the air-box, the working cylinder and the connecting pipe *remains constant.* The lower end of D is a plate pierced with holes, thru which the air flows when the displacer E moves downward. The upper part of D, thru which the coils G pass, is known as the *refrigerator.* The fire heats the air in the air box D. As the engine is started the displacer E moves downward, forcing the hot air thru the regenerator gauze F. Heat is absorbed by F and the air cooled. It is further cooled by the refrigerating pipes G. The pressure in H is therefore diminished and the piston moves downward. This forces the air back thru F into D, gaining heat from F and forcing the displacer upward. The heat gained from F, in addition to that gained from the fire, causes the air to *expand,* raising the piston in H. This completes the cycle. The inertia of the fly-wheel causes the fly-wheel to push down the displacer E and the cycle is repeated.

Steinmetz's Own Shorthand

(*Continued from page* 314)

"It is my opinion that every college student should learn some good accurate system of shorthand, so that he can follow the lectures and make notes without effort."

The system of shorthand that Dr. Steinmetz has evolved as the best adapted for writing on electrical subjects is based upon the "Arends" system of stenography as taught in Europe. Words are written as they are pronounced without regard to their spelling; that is, they are written phonetically. The word "height" is written h-i-t, but in this case the long "I" is used.

One of the most interesting features in connection with this system of shorthand is the fact that French and even Latin and Greek words and names can be perfectly written and read without the slightest hesitation.

With his own hand, Dr. Steinmetz has written down the rules, or it might be said, the "code" of his system, so as to assist those persons with whom he is working in a translation of his reports and various articles.

With a view of affording every reader of this article, especially those attending college, some knowledge of Dr. Steinmetz's system, a reproduction is given of the alphabet, written out by the famous electrical wizard himself.

Become An
Electrical Engineer

Bachelor of Science Degree in 3 Years

Study Here. Receive a good training. Our degree equals the University but is given for three years of intensive work twelve months of the year.

There is unlimited demand for well-trained ELECTRICAL ENGINEERS. A great industry is using them in vast numbers here and abroad.

Our forty professors are experts. Men of standing in the profession. They will guide you surely and carefully to certain SUCCESS.

Shop practice, laboratory, drafting room and recitation room prepare you fully to enter the Electrical Engineering profession.

$427 BUYS THIS "PRESTO-UP" Bolt-Together House

The Wonder Buildings of the Age

GUARANTEED

Purchased after most rigid inspection by some of the largest Steel, Coal and Industrial Corporations in the United States. You are not experimenting. "PRESTO-UP" Bolt-Together Houses are patented, manufactured exclusively by us and sold at money saving prices.

Seven different types of walls to choose from. Wind and weather proof. Invisible joints inside and out. Extremely simple to bolt together. Wonderful strength. Better construction than regularly constructed houses. Exceptionally good lumber. Cement coated nails. Fifteen Year Guaranteed Slate Coated Roofing. Well painted, and best of all, neat in appearance and so simple to bolt together that it is a pleasure to do the work.

"THE 100% WIRELESS MAGAZINE"

What "Radio Amateur News" Is:

It is destined to become the greatest Radio magazine in the world. Indeed its first issue, the July number, had a circulation of 15,000 copies. It was necessary to print a second edition of 10,000 copies—so great was the demand. The August issue, of which 20,000 copies are printed, with its 48 pages and cover in two colors, its 125 wonderful illustrations, make it the *greatest and biggest Radio Magazine in print today.*

RADIO AMATEUR NEWS is the only INDEPENDENT monthly wireless magazine in existence. It caters to no commercial interests—it has no boss save its readers. It is "different"—it has the latest radio news. It is a scientific magazine but it caters largely to the RADIO AMATEUR—it is by and for the Amateur. It is publisht by the publishers of the ELECTRICAL EXPERIMENTER, but there will be no duplication of articles in the two magazines. Both are entirely different—but both together will give you ALL the radio news of all the world. Whether you are a Professor or an Amateur, get a sample copy or order it from your News dealer today.

Page size is the same as Electrical Experimenter

For Sale at All News-stands

$100.00 RADIO CONTEST

is announced in the Aug. issue of RADIO AMATEUR NEWS.

"An Ideal Sending Outfit" is the subject of the contest. $100.00 in cash prizes for the best manuscripts submitted.

JUDGES OF THE CONTEST ARE:

Dr. Lee de Forest, Inventor of the Audion
Dr. Greenleaf W. Pickard, Inventor of the Crystal Detector
Dr. Louis Cohen, Ph.D., Radio expert and inventor
Samuel D. Cohen, Amateur Radio expert
H. W. Secor, Assoc. I.R.E., Associate Editor, Electrical Experimenter
H. Gernsback, Editor, Electrical Experimenter & Radio Amateur News

X-Ray Experiments

(*Continued from page* 319)

zation. This statement is not altogether accurate. Barkla has observed that when a pencil of rays enter an object which scatters them, the scattering is more marked in a direction parallel to the stream of cathode particles. The greatest objection has been advanced by Bragg. He reasons as follows: If a stream of cathode rays striking a target set up some sort of rays which it has been found instigate new cathode particles when they enter some body, it is reasonable to suppose that these rays merely serve as a means of transferring energy from one electron to another. He suggested that they might consist of neutral doublets made up of a *positive* and *negative* charge, which is broken up when the rays strike some object. This theory might explain why only a few and not all of the molecules in a gas are ionized, for as the doublet moved thru the gas only a few of the molecules would come into contact with it and be charged. Later, however, this theory was disproved.

The most important property of the rays is their power of making objects transparent and affecting a photographic plate. Procure about a 5 x 7 plate and carefully wrap it in black paper. Care should be taken that the *film side is placed upward* as the *glass* cuts off a good deal of the radiations. The bulb should be placed about six inches above the plate and the objects to be photographed laid directly upon it. The arrangement is clearly shown in one of the accompanying illustrations, Fig. 4. The bulb may be procured from several leading supply houses. The one shown is not provided with a third electrode. The coil is connected direct to the bulb, no condenser or spark gap being used. When the connections are properly made *the lower half of the bulb will glow a bright green.* If the polarity of the current is wrong, only a *ring of light* will show. The polarity may be corrected by a pole-changer in the primary circuit of the coil.

Radiographs, while once a comparative novelty, are now fairly common—especially since the war. Many interesting skiagrams have been returned from the front showing the invaluable work X-rays have accomplisht. The Customs House has made a novel use of their penetrating power. In order to see if anything such as bombs were concealed in bales of cotton or other apparently innocent objects, the bale would be placed before a powerful X-ray bulb and a man standing on the other side would examine it with a fluoroscope. Of course a small bulb operating on about a 2-inch coil does not possess very great penetrating power, but the reader should experience no difficulty in seeing thru the thick part of the arm. An X-ray picture taken with such apparatus is reproduced herewith. See figure. As was said above, the amount of penetration is proportional to the density, decreasing as the density increases. Use has been made of this fact in determining the atomic weight of unknown elements by measuring their transparency to X-rays. Benoist determined the atomic weight of indium by this process.

Another important property, and the one which gives us the readiest means of measuring their intensity, is their *ionizing* power. This may be easily illustrated by hanging a grounded plate above an electroscope of the ordinary flask type. The arrangement is shown in Fig. 2. *If the intervening air is exposed to x-rays the electroscope will be discharged.*

Another interesting experiment is to take an ordinary hydrometer and remove the float. Fill the bulb and about a third of the tube with water. Put your finger over the end to prevent the air from escaping and squeeze the bulb. It will be noticed that a cloud is formed. This is due to the moisture condensing around the dust particles in the air. After this has been repeated several times all the dust particles will be drawn down into the water and *no cloud will form.* Now, if when this condition has been reached, the apparatus is exposed to X-rays, a dense cloud will be formed. *This is caused by the moisture condensing around the ions, due to the X-rays.* This phenomenon forms the basis of the rain-making apparatus described in the February, 1919, issue of this journal as developed and patented by the Australian inventor and engineer, Balsillie.

Röntgen rays also possess the remarkable property of exciting *secondary rays* in substances which they strike. As this is a rather complicated phenomenon and as there are no experiments in connection with it which the average reader may repeat, it will not be discust here, except to mention that the secondary rays resemble the original cathode rays, only they travel at a slightly slower speed, which is dependent on the hardness of the primary rays. Recently X-rays have found a new application in the analysis of *crystal structure.* It was found that X-rays might be defracted by the cleavage surface of crystals. Using X-rays, it has not only been possible to determine the exact shapes of crystals, but also to actually show the arrangement of the atoms as well as the distance between them.

"Christmas Bullet" Plane to Fly the Atlantic

Another attempt to cross the Atlantic was announced recently by the Cantilever Aero Company, makers of the "Christmas Bullet" airplane.

In the company's plant at Amityville, L. I., assembling has begun on a huge airplane which is expected to start from New York and land within thirty-five hours at Queenstown, London or Brest.

It will have a wing measurement from tip to tip of 180 feet and will be equipt with four 800-horse power motors, giving a speed of 115 miles per hour. These motors are connected in such a way that should one be put out of commission the operation of the machine will not be affected. The engineer will also be able, if necessary, to overhaul any of the motors, clean the spark plugs and make adjustments while the plane is in flight.

The body of the machine will be 14 feet in diameter, insuring comfort and proper housing for the crew, who will not at any time be exposed to the elements.

There will be two three-bladed propellers in front of the machine. Each will be 21 feet in diameter, capable of making 600 revolutions per minute. The weight of the machine with full flying rig is 30 tons. It will be controlled thruout by electricity.

Two pilots will be seated in separate compartments, working alternately, each taking the machine for a certain length of time.

The construction and design of this airplane has been under consideration by the Cantilever Aero. experts for six years and every detail has been tested and approved by the designer and inventor, Dr. William Whitney Christmas, it is stated by the builders.

HIGH SCHOOL COURSE IN TWO YEARS

YOU ARE BADLY HANDICAPPED if you lack High School training. You cannot attain business or social prominence. You are barred from a successful business career, from the leading professions, from well-paid civil service jobs, from teaching and college entrance. In fact, employers of practically all worth-while positions demand High School training. You can't hope to succeed in the face of this handicap. But you can remove it. Let the American School help you.

FIT YOURSELF FOR A BIG FUTURE This Course, which has been prepared by some of America's leading professors, will broaden your mind, and make you keen, alert and capable. It is complete, simplified and up-to-date. It covers all subjects given in a resident school and *meets all requirements* of a High School training. From the first lesson to the last you are carefully examined and coached.

USE SPARE TIME ONLY

Most people *idle* away *fifty* hours a week. Probably you do. Use only one-fifth of your wasted hours for study and you can remove your present handicap within *two years.* You will enjoy the lessons and the knowledge you will gain will well repay the time spent in study.

TAKE 10 LESSONS FREE So that you may see for yourself how thorough and complete our training is. We invite you to take *ten lessons* in the High School Course—or any Course of specialized training in the Coupon below—before deciding whether you wish to continue. If you are not then satisfied you are not out one cent. *We absolutely guarantee satisfaction.* On that basis you owe it to yourself to make this test. Check and mail the coupon NOW for full particulars and Free Bulletin.

4 Famous Books

EACH ONE A BIG SUCCESS!

THE BOOKS YOU MUST HAVE

Wireless Course in 20 Lessons

By S. Gernsback, A. Lescarboura and H. W. Secor, E. E.

A course that tells you everything you can possibly want to know about "Wireless" starting off in lesson No. 1 by explaining the Principles of Electricity. The second and third lessons are devoted to magnetism, motors, generators and wiring. And then, by simple, easy stages, this wonderful Course takes you into "Wireless". The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject. To lend charm to the Course, the last lesson (No. 20) is devoted to a history of Wireless and the men who developed it.

Size of book is 7 x 10¼ in. 160 pages, 350 illustrations, 30 tables. Postpaid

Flexible cloth cover.....per copy $.50
Stiff cloth cover.....per copy 1.00

Experimental Electricity Course in 20 Lessons

By S. Gernsback and H. W. Secor, E. E.

A Course of the theory and practice of Electricity for the Experimenters. This is undoubtedly one of the most complete and comprehensive treatises of this special subject ever published. The book is written by the same authors as the famous "Wireless Course in 20 Lessons".

Every phase of experimental electricity is treated comprehensively in plain English. It is a book not only for the beginner but for every experimenter and student of Electricity. New Experiments are described and explained and nearly every application of Electricity in modern life is given in simple language.

The book contains 160 pages and more than 400 illustrations.

Flexible cloth cover....per copy $.50
Stiff cloth cover.....per copy 1.00

No. 1. How to Make Wireless Sending Apparatus
No. 2. How to Make Wireless Receiving Apparatus

By 20 Radio Experts.
Two Remarkable Books

Book No. 1 contains 100 pages, size 7 x 5 in. and 88 illustrations, paper bound.

Book No. 2 contains 100 pages, size 7 x 5 in. and 90 illustrations, paper bound.

These two books have been written and published entirely for the wireless enthusiast who wants to make his own radio apparata. They contain more information on how to make it than any other books we know of. Only strictly modern radio apparata are described in these books and the illustrations and descriptions are so clear and simple that no trouble will be experienced in making the instruments.

Book No. 1—How to make Wireless Sending Apparatus 25c
Book No. 2—How to make Wireless Receiving Apparatus 25c

THE EXPERIMENTER PUBL. CO. Book Dept., 233 Fulton St., New York

CARNOTITE

(Radium Mineral.) The American Pitchblende found in Colorado, from which *Radium* is extracted.

A generous piece, enough to conduct experiments, such as affecting photographic plates thru opaque material (similar to X-Ray pictures), first made by Sir W. Crookes and Mme. Curie, is furnished in neat, wooden box.

URANIUM ORE (*Radio-Active*)

Containing about 35% of pure Uranium; also Radium and Vanadium. One of the most rare and interesting minerals. Twenty milligrams are furnished in glass vial protected by lead cover.

One box of *Carnotite* and one vial of *Uranium Ore* as described above 50c sent prepaid.

FORMULAS

Luminous Paint—Silver Plating Powder—Liquid Court Plaster—Soap Bubble Liquid—Straw Hat Bleach—Collapsible Tube Tooth Paste—Resilvering Mirror Liquid—Polish for Tan Shoes—Dressing for Tan Shoes—Paint to make Oil Cloth.

These Ten Recipes in sealed envelope for 50c. Sent prepaid.

SIDNEY SPECIALTY CO., 233 Fulton Street New York City

Thunderstorm Electricity

By Rogers D. Rusk, M. A.

(*Continued from page* 307)

ly called *thunder-caps,* or *thunder-heads,* and often the clouds will grow so thickly together that to an observer on the earth they appear as a huge dark rolling-cloud extending across the sky, the tops being obscured except to aërial observers several thousand feet in the air. It is while such clouds as these are forming that the electrical forces are at work which build up enormous charges in a manner which will now be described.

How Rain-Drops Form.

Experiments show that *ions* are nearly always present in the air. Sometimes these are *charged dust particles,* sometimes they are *charged atoms of the gases* of which the air is composed. Experiment further shows that rain-drops condense about *negative ions* much more quickly and easily than about *positive ions.* The earth itself is a very highly charged *negative* body, its charge being estimated at 600,000,000 volts, but the rain that falls is *positively* charged almost as often as it is *negatively,* which may be accounted for by the fact that the *positive* drops, forming more slowly, are larger and heavier and are not retarded so much at times by upward currents of air. It is these upward currents of air in the clouds themselves that produce the charges within the clouds. The *negatively* charged drops being smaller and lighter are carried to the top of the cloud, very often forming a heavy *negative* charge. In a similar manner the heavier *positively* charged drops will fall to the bottom of the cloud forming a strong *positive* charge. In addition the wind may break up the drops into smaller droplets and when this is the case, it is found that the smaller droplets are nearly always *negatively* charged. By these processes of division and formation of charged drops and their separation in the cloud, enormous charges are generated, and the thunder-cloud is seen to be really a huge electrical generator as shown in Fig. 3. And when the charges become sufficiently great the lightning discharge results. This may take place from top to base of cloud which is usually a distance of about a mile, or it frequently takes place between the base of the cloud and the earth which is often a much shorter distance. From cloud to cloud the lightning may flash a distance of *ten or twenty miles,* and at such a time the discharge exercises a powerful *inductive* effect on all nearby clouds, which may cause flashes to occur in rapid succession.

When a *negatively* charged cloud approaches the earth, the *inductive* effect of the earth's charge may cause it to suddenly reverse its charge to *positive,* and the potential become so great that a discharge to the earth follows. Sixty per cent of these discharges to the earth carry *negative* electricity to the earth, while the remaining forty per cent carry *positive* electricity. This shows that sixty per cent of the discharges were from clouds which had built up a higher *negative* charge than the earth itself.

The phenomena of thunder-storm electricity cannot be said to be the product of any one particular cause, or of always exactly the same combination of causes. One thing, however, is certain. All of the above mentioned factors act together and atmospheric conditions are so variable and in such a continual state of change that a definite formula for their operation would be beyond the limits of possibility. The theories of thirty years ago which tried to explain lightning by means of atmospheric friction and other such causes have sunk into oblivion.

Experiments in Physics

PERPETUAL MOTION

By John J. Furia

(*Continued from page* 315)

See Fig. 6. In Electrostatics we learn that the sharper the point of a conductor, the greater the density of the charge present. Because of the great density, the charge leaves the conductor at the sharp points. If by some means we continually charge a conductor having a shape like that in Fig. 1, then the reaction will cause it to move as indicated by the arrows. The source of the charging can be a static machine (Whimshurst or other type). Why not belt the conductor so as to run our static machine; and sidetrack some of the electricity from the machine to be used for other purposes? One has but to look at the small weight of the conductor and the slow speed

"Perpetual Motion" de Luxe. The Atmospheric Pressure on the Water in the Bowl Will (Theoretically) Force the Water Up Thru the Circular Pipe and Out of Its Open End. Thus the Water Will Circulate Around and Around—Yes It Will—NOT!!!

at which it runs and compare it with the large heavy static machine and the large force required to cause it to give a spark, in order to perceive at once the folly of such an absurd scheme.

Another idea along somewhat similar lines is the following: A screw fits tightly in a cylinder at the top of which is an ordinary rotary lawn sprinkler. As the screw is turned the right way, the water rises in the cylinder. When the water reaches the level of the sprinkler, it comes out from the nozzles and the reaction causes the sprinkler to turn. Once this machine is started it should operate forever, for as it turns, water rises to the sprinkler—while as the sprinkler operates, it turns and causes water to rise in the cylinder. It takes considerable force to cause the sprinkler to rotate due to the reaction; it would require still more force if the sprinkler had to in addition do the work of lifting the water up the cylinder. The reaction due to the water coming out from the level of the sprinkler *with no force behind it* is very small, and not ever sufficient to cause the sprinkler to budge. See Fig. 2.

Fig. 3 represents the cross-section of a cylinder containing grooved curved spokes. Marbles or lead balls rest in the grooves. It will be seen that the marbles at the left are further from the center than those at the right. Consequently because the rotational moment on the left is greater than that on the right (the marble being of the same size and weight) not only will the machine move perpetually and do work, but it will even start itself? By putting a belt around the cylinder, machinery can be driven continually, perhaps?!X! It is true that the moment on the left is greater than that on the right and therefore there is *apparently* a tendency to cause rotation opposite to the rotation of the hands of a clock, but if rotation is to take place the top marbles near the center vertical axis will have to be raised over the bend in the spoke, and the machine having no means of doing this, the scheme fails miserably.

The following is a good example of perpetual motion proposed by one ignorant of the simplest fundamentals of hydrostatics. If a pipe having a very large bowl is connected to a piece of tubing of small diameter, and curled in the shape shown in Fig. 4, when water is placed in the bowl, it should come out from the end of the tubing, thus filling the pipe bowl again and the passage of water from the pipe bowl out thru the stem and tubing back to the pipe again *will be continuous?* This will operate as long as the amount of water in the bowl is large compared with that in the stem and tubing, for then the weight in the bowl will be greater than that in the stem and tubing, and the weight in the bowl will force the water thru the stem and tubing, said early philosophers. This explanation, of course, ignores the fact that it is the pressure in the liquid that counts and not its weight, and since both ends (the bowl and the tubing) are exposed to the atmosphere, they are at atmospheric pressure and hence the liquid will stay at the same level in both.

(NEXT ARTICLE—STAGE TRICKS AND ILLUSIONS)

Jeweled Portal Welcomes N. Y. Fighters

(*Continued from page* 311)

altar on the farther side, making a total width of 110 feet. The bejeweled obelisks rise to a height of eighty feet and are surrounded by great jeweled forms in the shape of sunbursts which are each twelve feet wide and twenty feet in length.

Lighting of the portal was effected by two banks of twelve 18-inch searchlights at Fifty-eighth Street and Sixty-second Street, respectively, which threw shafts both up and down town. This effect of *more than a million candlepower* reflected by the 31,000 jewels, defies description, and New York held its breath and watched the fairy spectacle.

Cut glass jewels, cut scientifically to imitate diamonds, rubies, emeralds and sapphires, are mounted in such a manner as to be kept in motion by the breeze. All the colors of the spectrum gleam from these jewels as the screened lights search out the portal and the tower tops sparkle in veritable glory above.

While the Victory Arch, and the Court of Heroic Dead attracted many thousands of persons, the dazzling effect of the "Jeweled Portal" set the vast crowds astirring, backward and forward in order to obtain a better or different view of the wonderful illumination.

The "Jeweled Portal" cost $40,000 to erect, and after being lighted for the first time was acclaimed the greatest thing New York had ever seen.

Architecturally, the portal is an achievement and an innovation praised without stint by the architects of New York, and reflecting great credit upon Mr. Ryan and Captain Gosling, in whose minds the entire scheme was born.—*Photo Courtesy General Electric Co.*

Be a Doctor of Chiropractic

Build a successful career in this great profession—Chiropractic, the advanced science of treating disease through spinal adjustment. The demand for Chiropractors is constantly increasing. In larger numbers than ever before intelligent, thinking people are becoming convinced that it is the common sense and really scientific way to relieve pain and disease.

Learn At Home We teach you by mail or in class. Instruction under the personal direction of a faculty of competent, practical Chiropractors. You can master this good paying profession and graduate with the degree of Doctor of Chiropractic while holding your present position. No special preliminary study and no more than a common school education are required. The cost is small—terms easy.

$3000 to $5000 a Year

The success of many Chiropractors has come so quickly as to be almost startling. Incomes of from $3000 to $5000 are not rare—some, upwards of $10,000 a year. Dr. M. D. Moore, of Kentucky reports $9000 a year; Dr. L. H. Roche, New Jersey, $5000; Dr. Hanna, of Florida, over $5000. You will receive the same kind of instruction which these Chiropractors received. Your prospects will be as bright as theirs. There is no reason why you should not do as well or better.

22 FREE Charts Lithographed and printed in colors. Actual value, $31.50. On this offer you get them all free. Send coupon for facts about this free offer—also 72-page Free Book which tells all about Chiropractic and its wonderful possibilities. This is your big opportunity to enter a dignified profession, be your own boss, be occupied in pleasant, profitable work and become independent. Mail coupon today.

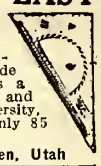
Peacetime Uses for War Inventions

By H. Winfield Secor

(Continued from page 365)

gines of the distant vessel is picked up by a sound-sensitive electrical instrument, known as a *microphone*. By turning the microphone in different directions, and noting carefully the position where the maximum sound is heard in the receivers, the spot from which the sound originally emanated can readily be determined even to within a fraction of a degree, it is claimed. For locating icebergs or other obstructions, which of course do not produce any sound themselves, there is required a *sound producer* such as an under-water electric bell or siren. The sound waves radiate from this device, mounted between two microphones on a rotatable arm secured to the vessel, as the illustration shows, travel outward until they impinge against the iceberg or other impediment, when they are *reflected* as the arrows show. These reflections, or the "echoes," are listened for by the aid of microphones and sensitive telephone receivers connected with them. By swinging the bar supporting the microphones and siren in different directions, the position of the obstruction is at once determined. Its distance can also be ascertained with some of the more highly developed apparatus of this class, by direct reading instruments, or else by the relative strength of the sound heard in the receivers.

The *Radio Compass*, as it is called, has come greatly to the fore in the past three years. Prior to the World War it existed mostly in the laboratorial stage. But at the close of the war radio compass stations were to be found not only in the principal coastal regions in the vicinity of shipping activities, but they were also to be found on the great battlefields of Europe, where they were used for the purpose of accurately locating "enemy" radio stations. The radio compass should, we might almost say, find even a greater field of useful application in peacetime than it did during the war. It promises to become one of the most important scientific developments in wireless telegraphy, particularly for the navigation of aircraft. We were recently informed by a naval radio expert that the English Navy had the radio compass scheme worked out to wonderful perfection, and that during the war they were actually able to steer vessels up the entrance to the Liverpool Harbor, one of the most treacherous harbor entrances in the world, on the darkest and most foggy nights, without ever having a collision. See Fig. 9. To do this, a series of radio compass stations were situated on either shore at short intervals, and these stations sent out predetermined radio signals at successive intervals. This expert also mentioned that it was very easy for any Allied war vessel to instantly obtain her location and bearings if she was anywhere about the coast of England or Ireland, utilizing the service of the radio compass stations which dot these coasts. If the vessel wished to know her location, the radio code signal for interrogative "L" was sent out twenty times. This was the official notice to nearby radio compass stations that the ship calling wished to know her location. At least two land compass stations then took readings of her signals, and by triangulation and by means of wire or wireless communication between the two stations which had a fixt base line, the triangle was solved in a few minutes, and the exact location of the ship was transmitted to her radio officer from one of the land stations. The ship received her location figures in latitude and longitude about five minutes after sending out the call letter aforementioned.



SPECIAL KON-VER-TER SLIDE RULE

The Hamilton KON-VER-TER slide rule has over 8000 graduations and over 1800 charactera on it, will handle anything in Arithmetic, Algebra, Geometry or Trig. This slide rule is in use in all parts of the world and is much simpler to operate than others of similar lines. Does not require a wizard to use it.

Electricians Get up-to-date in HOUSE WIRING! Save TIME, MONEY, LABOR and MATERIAL by using our 98 GENUINE BLUE PRINT DRAWINGS, containing all the lateet diagrems and connections known in house wiring—every diagram and connection up-to-the-minute as used by first class electricians for wiring BELLS, BURGLAR ALARMS, LIGHTS, ANNUNCIATORS, FIRE ALARMS and ELECTRIC GAS LIGHTING. These drawings are bound in the form of a flexible book (9 x 12) for convenience in using on the job. Send for them, and if they don't make you more efficient as a wireman and seve you many times their cost as a contractor, return them and money will he refunded—you cen't efford to be without them. ONE DOLLAR postpaid. Send for circulere on other sets of drawings.

PATENT SPECIALTY COMPANY
P. O. Box No. 583, San Francisco, Cal.

INSYDE TYRES Inner Armor for Auto Tires. Double mileage, prevent blowouts and punctures. Easily applied to any tire. Thousands sold. Details free. Agents wanted. Amer. Accessories Co., Dept. 53, Cincinnati

Airplane Photography was pre-eminently one of the most highly developed sciences brought out by conditions imposed by the World War. Complete sections of the battlefront often had to be photographed in a single day's time, and by means of camera guns, and other extremely rapid photographic devices, thousands of pictures could be taken within a few hours in such a manner that when the films were developt and prints made, which took a short time with the perfected apparatus used by the Army in the field, these prints could be matched up by map experts so as to give a true composite photograph of an entire region. The work done by the Photographic Department of the Army in this respect was nothing short of miraculous. At a recent exhibit of this Department's work, one of the composite aërial photographs showed the entire city of Washington, D. C., and environs. The airplane flew over Washington in a certain prescribed course and took all of the photographs which composed the composite view in a little over *two hours!* The individual prints making up the composite view usually measured about three inches square. Imagine how easy it now becomes to obtain actual physical maps of such regions as the Rocky Mountains and other inaccessible and treacherous localities so that our geographies of tomorrow may indeed prove a marvelous revelation to the school students of today. Airplane photography in its modern aspect and with the high speed available should lend itself well to the requirements of mapping real estate, large farms, railroad sites and hundreds of other localities for many kindred purposes. See Fig. 10.

Gas Masks, as well as *Gas Detectors,* find many uses in our everyday life. The gas masks are useful to firemen and rescue squads and prove particularly efficacious for use in entering gas-filled mines and other subterranean passages. Gas detectors are not so well known to the general public, as these proved one of the extremely valuable keys to the success of the Allied soldiers. One ingenious form of electrical gas detector is illustrated in Fig. 11. This detector, which also permits of the measurement of the amount and strength of the gas present, comprises a pair of sensitive detecting wires, also a pair of resistance coils and a galvanometer, forming a Wheatstone bridge system, as the diagram shows. At the bottom of the apparatus is shown a metal block in which there are two cavities, each containing a gas detecting wire, and the gas reaches one of these wires thru a series of perforations placed in the external wall of the block. This clever patent has been granted to Gilbert A. Shakespear of Birmingham, England (U. S. patent number 1,304,208).

Depth Bombs apparently seem to be one of those peculiar inventions which follow the old adage—"killing two birds with one stone." Not only did they prove the undoing of the career of many U-boats, but they likewise show great promise of performing many useful peacetime tricks as well. Among other things, the depth bomb should prove uniquely successful in blasting ice jams in river gorges, etc. And as one of our naval officer friends recently told us, thousands of fish are stunned and killed every time a depth bomb is detonated on the water. See Fig. 12. Therefore, why fish with nets in the ocean, when by means of a few depth bombs detonated thirty to forty feet below the water you can stun or kill thousands of fish? Then by a simple suction arrangement pull them into the fishing smack so fast that it would take seventeen bookkeepers and three adding machines to keep account of the catch. Another practical use for depth bombs is the clearing away of derelicts or other obstructions in harbors, lakes or on the ocean.

BOYS

Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you.* Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6196, SCRANTON, PA.

GREATEST TOY SENSATION OF THE DAY!

FIGHTING DREADNAUGHT

SENSATIONALLY REALISTIC!!!

Here is a model of Uncle Sam's fighting monsters. Eight big guns, each of which flashes, at correct intervals, from twelve to twenty times. Extra ammunition always obtainable. Absolutely harmless. Can be operated indoors or out. Now boys! Here's your chance to see a battleship in action, and the best of it is you can OWN the ship and command the firing yourself! By getting two or more Battleships, you can arrange EXCITING NAVAL BATTLES in your own home. **Price of Warship and Ammunition, 15c, three for 40c, or a fleet of 4 ships for $1.50 postpaid. Extra ammunition, 5 cents per doz.**

TOOTH-ACHE STOP

BEST TO USE

Stops the Pain; Stops the Tooth

Squeeze a little in hollow of tooth; the **Asha Stops instantly** the paste hardens, forming an antiseptic Filling. Absolutely painless. Have it ready for the next bad attack. **25c per tube, postpaid.**

"SAFETY 1st" PINS

A clever novelty. The National Safety Pirate. Wear one and show your sympathy with the movement. Also handy for wearing at amateur theatricals and the like. Size 2½ in. (gold plated) and 1¾ in. (nickel-plated) 6c each, two for 10c p. pd.

Mysterious Ghost

This is not a pretty object, but it is a perfect delight for people who like practical jokes. The Ghost, when placed in a perfectly dark place, glows with a ghastly cold bluish radiance, very apt to give one a "creepy" sensation even when you know all about it, but a regular shudder for those who come upon it unexpectedly. A great joke to play on your mother-in-law. **Price only 15 cents each, 3 for 40 cents.**

INKLESS PEN

WRITES with WATER 600 words to every time you dip. Makes its own ink. Writes fashionable violet color. Better and cheaper than fountain pens. Writes a long letter with one dip in plain water. No trouble—no bother—no muss. A pleasure to use. With Nickel Plated Reversible Holder **10 CENTS.** 3 for 25c

SIMPLEX TYPEWRITER ONLY $2.50

Cheap But Good. So Simple a Child Can Use It. We Guarantee the Writing.

Though so marvelously cheap, this machine is a **thoroughly practical Typewriter** and we guarantee it to produce writing equal in every respect to that of any $100 machine. It does not seem reasonable that we can send you a specimen of its work and you will be convinced. With reasonable care it will last a lifetime. It is so simple that a child just able to read can write with it. You can learn all there is to know about it and write a letter within five minutes, and the practice will make you an **expert operator.** Every business man must have a typewriter. It is legible and writes in handsome script and means the impression that the firm is a no-account and slow-going concern. We assure you that the Practical Typewriter fully deserves its name as it fit to the correspondence of any business or profession, and to do it we should not have the chance of securing a customer again. The letters of the alphabet, the numerals 1 to 10, and punctuation marks are so arranged that the letters most used are before the operator most of the time, enabling him to write rapidly. The rollers hold the paper in position while writing and at the end of each line a slight turn of the roller moves the rachet which makes a click and forces the paper forward, giving the proper line spacing, so that the lines are all an equal distance from each other; so desirable in letter writing. Each machine is packed in a neat box, with full printed instructions for use. Price complete, $2.50 sent by mail postpaid.

Johnson Smith & Co., Dept. E10, 3224 N. Halsted St., Chicago

SQUIRT RING

You may have a lot of fun with this Sparkling Gem Squirt Ring. It consists of a handsomely plated ring, attached to a rubber ball, as arranged that the latter is quite out of view when the ring is in proper position. Such an attractive looking gem or ring cannot fail to be the center of attraction. While the victim is absorbed in getting a closer view, you just squeeze the rubber ball and the observer experiences a very great surprise. **PRICE 20 CENTS,** three for 50c as a postpaid. J. S. & Co.

Wonderful X-Ray Tube

A wonderful little instrument producing optical illusions of such surprising and startling. With it you can see what is apparently the bones of your fingers, the lead in a lead pencil, the interior opening in a pipe stem, and many other similar illusions. A mystery to your friends and be seen able to satisfactorily explain. Price 10 cents; 3 for 25 cents; 1 dozen, 75 cents. Sent by mail, postpaid.

Sneezing Powder

Place a very small amount of this powder on the back of your head, and blow it into the air, and everyone in the room or car will begin to sneeze without knowing the reason why. It is most amusing to hear the remarks, as they never suspect the real source, but think they have caught it one from the other. Between the laughing and sneezing you yourself will be having the time of your life. For parties, political meetings, car rides, or any place at all where there is a crowd it is positively fit is the greatest joke out. Price 12c or 3 for 30c.

By Express Only

STAGE MONEY

With a bunch of these bills, it is easy to create the impression that you are a prosperous appear prosperous. By flashing a roll of these bills at the proper time and peeling off a genuine bill or two from the outside of the roll, the effect created will be found to be just what you desired. **Prices, postpaid: 10 Bills 10c, 50 Bills 25c, 125 for 50c, or $3.50 thousand.**

NEW BOOK ON ROPE SPLICING

USEFUL KNOTS, HITCHES, SPLICES, ETC.

How Different Knots Are Made and What They Are Used For. Knots to Use and Knots to Avoid.

A most practical handbook giving complete and simple direction for making all the most useful knots, hitches, rigging, splices, etc. Over 100 illustrations. All about wire rope attachments, lashing, blocks, tackles, etc. 37 Heraldic Knots illustrated. Of great value to mechanics, riggers, campers, boatmen. Price 20c p. p. Stamps taken.

Johnson Smith & Co., Dept. E10, CHICAGO

LUMINOUS PAINT

Make Your Watches, Clocks, Etc., Visible by Night The very latest discovery in the scientific world. Hitherto, practically unobtainable except at an exorbitant price, we have at last succeeded in producing this remarkable LUMINOUS PAINT, which, applied to the surface of any article, renders it plainly visible in the darkest night. THE DARKEN THE NIGHT, THE MORE BRILLIANT IT SHINES. Quite simple to use. Anyone—you can do it. A little applied to the dial of your watch or clock will enable you to tell the time by night. Also to the buttons or switch plates of your electric light, match boxes, and innumerable other articles; make your automobile number plate visible at night. Bottle containing sufficient to coat several small articles, **Price 25c, Larger sizes 50c and $1** postpaid. Johnson Smith & Co., Dept. E10

MUSICAL KAZOO

With the Musical Kazoo you can, without previous practice whatsoever, play any tune right off, imitate any bird or animal, bagpipe, snare drum, Punch and Judy, etc. No holes to fuss with, the instrument itself. Produces excellent music. You do not blow into it, but sing, speak, laugh or make any desired imitation. Used with astonishing results at society meetings, home, club or church entertainments, dances, serenades, picnics, outings, nurseries. Just the thing for theatres and shows, bicycle and marching clubs, etc. Excellent for vocal or instrumental accompaniments, either with or without other musical instruments. **Price 15cn. pd.**

MAGIC FLUTE

Wonderfully Sweet Toned and Musical

A marvelous musical instrument. This instrument produces sweeter music than it be the joyous notes of a quick-step or the solemn strains of a church hymn—in fact, any class of music can be played upon the Humanaphone without practice, as it almost a self-playing instrument. When played with a piano accompaniment, or any other musical instrument, the effect is charming. Full printed instructions for playing sent with each instrument.

JOHNSON SMITH & CO., Dept. E10, 3224, N. Halsted St. CHICAGO

Boys, you can have Movies at your own home with this latest model

MOVING PICTURE MACHINE

Uses Standard Films same as the larger machines. Very easily managed. Simply turn the handle. Good Variety of Films always obtainable

PRICE Complete ONLY **$2.65** Postage 15c. extra Including Film.

Extra Films, 15c each postpaid

THIS IS A GENUINE MOVING PICTURE MACHINE and the motion pictures are clear, sharp and distinct. The Moving Picture Machine is finely constructed, and carefully put together by skilled workmen. It is made of Russian Metal, has a beautiful finish, and is operated by a finely constructed mechanism. The projecting lenses are carefully ground and adjusted, triple polished, standard double extra reflector, throwing a ray of light many feet, and enlarging the picture on the screen up to three or four feet in area. The light is produced by a safety carbide generator, such as is used on the largest automobiles. This throws a dazzling white light on the screen.

It is a solidly constructed and durable Moving Picture Machine. The mechanism is exceedingly simple and is readily operated by the most inexperienced. The pictures shown by this marvelous Moving Picture Machine are not the common, crude and lifeless Magic Lantern variety, but are life-like photographic reproductions of actual scenes, places, and people which never tire its audiences. This Moving Picture Machine has caused a rousing enthusiasm wherever it was used.

JOHNSON SMITH & CO.

Dept. E 10 3224 N. HALSTED ST., CHICAGO

ANARCHIST BOMBS

Consists of a little glass vial, containing a liquid form a chemical which will produce a most horrible odor. One dropped in a room full of people will cause more consternation than a kingsize bonfire. The smell will entirely disappear in a short time. 3 Boxes for 25c, shipped by express only with a Dollar's worth of other merchandise.

ITCHING POWDER

This is another good practical joke; the intense discomfiture of your victims is certainly enjoyable. All that is necessary to start the ball rolling is to deposit a little of the powder on a person's hand and then a fingerful of the powder can be relied upon to do the rest. The result is a vigorous scratch, then some more scratch, and still more scratch. 8 Boxes for 25c. Sent only by express. (Must order at least One Dollar's worth of other merchandise.)

INVISIBLE INK

The most confidential messages can be written with this ink, and the writing MAKES NO MARK. Cannot be seen unless you know the secret. Invaluable for many reasons. Keep your pockets and other private memorandums away from prying eyes. Great fun for playing practical jokes. **Only 15c Bottle**

LOVE LETTER INK

Writing written with this remarkable ink vanishes entirely in a few weeks (sooner if desired), leaving the paper QUITE BLANK. 15c p. pd.

LUMINOUS INK Writing can be READ ONLY IN A DARK ROOM; writing shines like fire. Quite invisible at daytime. **Price 15c per bottle; 3 for 40c postpaid.**

JOHNSON SMITH & CO.

MULTIPLYING BILLIARD BALLS

The Best Feat of its Kind

This trick is an effective and surprising. The performer handles around the ball for examination, and is convinced that it is returned to him he seizes it by the tips of his thumbs and fingers and a second ball mysteriously appears. This is held in full view of the audience by the tips of the fingers of the left hand, and even while being held in position, another ball unexpectedly makes its appearance. Finely the magician apparently suffers from some kind of a spasm and yet another ball is the result. The feat can then be reversed, the balls disappearing one after another until none remains. A very interesting trick that is quite easily performed by following the directions that accompany the apparatus. **Price, 25 CENTS, POSTPAID.** JOHNSON SMITH & CO.

GOOD LUCK RING

Quaint and Novel Design

A VERY striking and uncommon ring. Of massive solid silver. Skull and crossbone design, with two brilliant Jet Black Stones sparkling out of the eyes. Is never failing object of interest. It is said by many to bring Good Luck to the wearer. Hence its name. **Good Luck Ring,** a id whilst we cannot positively guarantee that, it is certainly a very unique ring that you will take a pride in wearing. They were made to order for a special occasion so will supply them to customers mentioning this paper. **ONLY A FEW LEFT. 25 CENTS. POSTPAID.** JOHNSON SMITH & CO.

LOADED CIGARETTES

Just Like Ordinary Cigarettes, But Such Real Starters.

A box containing ten apparently genuine Cigarettes. They contain a cap which causes a report when every third is smoked.

They appear real, and afford as good a smoke (while they last) that the victim is taken entirely by surprise. A great laugh producer and extremely funny. **Price, box of ten, 30 cents, costpaid.**

Johnson Smith & Co., Dept. E10

THE "LITTLE GIANT" TYPEWRITER

A First Class Writing Machine For $1.25

A per cent little typewriter for $1.25? Yes, there are thousands of persons who would like to use a typewriter but whose needs and business do not warrant the expense at school or to the purchase and use of a fifty or seventy-five dollar machine. We confidently recommend our Little Giant. It is strongly made, but simple in construction, so that any one can quickly learn to operate it, and write as rapidly as they would with pen and ink. The letters of the alphabet most frequently used being grouped so as to enable one to write rapidly, the numerals 1 to 10, and the punctuation marks being together. With this machine you can send your best girl typewritten love letters, add-ress envelopes, make out bills, and do almost any kind of work not requiring a large expensive machine. With each typewriter we send a full printed instructions for using the machine. Price complete $1.25 by mail postpaid.

SERPENT'S EGGS

Each box contains 12 Eggs, which are no larger than a grain of oats. When lit with a match, however, each egg grad-ually hatches itself into a Snake several feet long, which curls and twists about in a most lifelike manner. **Price per box 10c, postpaid.** Johnson Smith & Co.

MYSTIC SKELETON

A jointed figure of a skeleton 14 inches in height, will dance to music and perform various gyrations and movements while the operator may be standing at a distance from it. The figure may be manipulated by the operator. When handed back to the operator it is only necessary to sit down, stand up, dance, etc. We send full direction with each Skeleton, for the aid of which anyone can readily make it perform. **10c postpaid.**

CIGARETTE ROLLER

Very neat and handy. Weighs less than a quarter of an ounce. It makes better cigarettes than you can buy and makes them easily and quickly. You can use just the tobacco you prefer and thus have nicer "smokes" than ready made, and more of them besides saving about half of your money. Just try one and make your cigarettes just to your liking. **Price only 10c or 3 for 25c postpaid,** with full instructions for use. JOHNSON SMITH & CO.

MIDGET ILLUSTRATED BIBLE

A Great Curiosity

The Smallest Bible in the World

The Midget Bible is a perfect gem, and a work of art. It is about the size of a postage stamp, and contains TWO HUNDRED AND FIFTY PAGES of the NEW TESTAMENT, profusely illustrated. This little Bible is a wonder. It is said to be the smallest in the world. Every one should have one to be appreciated. **Price, only 12 cents, three Bibles for 30 cents are dozen Bibles for $1.00 or 100 for $8.00.** Good agents wanted. Sample Bible 15c postpaid. Bibles amongst friends, church acquaintances, Sunday schools, bazaars, etc. Send for a few and try it.

The CONJURER'S CASKET

Apparatus and Directions for a Number of Mysterious Tricks Enough for an Entire Evening's Entertainment

ANYONE CAN DO THEM 50c

It is great fun mystifying your friends. Get this Conjurer's Casket, and you will be the cleverest fellow in your district. It contains the apparatus for seven first-rate tricks, including The Disappearing Coin Box (a coin is placed in the little wooden barrel, and when opened again, is found to have vanished entirely, or can be made to change into a coin of another denomination); The Famous Mesmerized Penny that defies the law of gravitation (suspends from the palm of the hand, nose, cheek, wall, clothing, etc.); The Glass Goblet and Vanishing Coin Trick (a coin is dropped into a glass of water, and when the water is poured out the coin has vanished). With the seven tricks described above we send full printed instructions for performing each trick, so that anyone can readily perform all these tricks to the great amusement of their friends or the public. Any boy of ordinary intelligence with this Cabinet of Tricks in his possession, can give a parlor entertainment not inferior to some regularly advertised performances. Remember the tricks contained in the Cabinet, there are twenty-five other feats and illusions fully explained with full printed instructions, for which you can easily procure the necessary apparatus. Among them are The Mouse in a Pack of Cards, The Drawn Card, The Hat Trick, To Knock a Tumbler Through a Table, One Cent Rubbed into Two, To Find the Number Thought of, Mysterious Wedding Ring etc. We also send the secret of performing three wonderful stage tricks, as follows: The Act of Cremation of a Woman, Walking on the Ceiling of a Room, and the Disappearing Lady, together with an article on legerdemain and valuable hints to amateur conjurers. **PRICE COMPLETE ONLY 50 CENTS.**

JOHNSON SMITH & CO., Dept. E10, 3224 N. Halsted Street, CHICAGO

The Newest Novelty Aerial Balloon

Flies gracefully in or outdoors. This is the VERY LATEST SENSATION IN BALLOONS. A brightly colored balloon that measures sixteen inches in length. Blown up in the usual manner, when released, the air pressure sends the balloon SOARING UPWARD with a high pitched propeller SPINNING AROUND AT A LIVELY RATE. The effect is startling. It is a graceful flier that makes the youngsters WILD WITH JOY. May be used repeatedly indoors or outdoors. An immensely interesting toy. **Price 10c each, 3 for 25c ppd.**

JOHNSON SMITH & CO., Dept. E10, 3224 N. Halsted Street, CHICAGO

"The Baby" Double Action Hammerless Revolver

A HANDSOME AND MOST EFFECTIVE WEAPON

$6.50

Measures but 4¼ inches long

Takes regular .22 calibre cartridges

The new **Baby Double Action Hammerless Revolver** has been produced to meet the ever increasing demand for a revolver that would combine small size and light weight with the essential features of **Efficiency and Practicability.** It is small in size, yet is just as effective and serviceable as the most expensive weapon you can buy. Every lady should have a revolver and should know how to use it, and there is no safer or better one made than this. A great feature is its safety action that guards against accidental discharge, making it quite safe for young men and ladies. The illustration gives an idea of its appearance, but it must be seen and used to be thoroughly appreciated. The ammunition used is the regular .22-calibre short cartridge obtainable anywhere, or you may obtain the cartridges from us. Cartridges can be shipped only by express. The revolver fires six shots in one loading. The operation of the charging mechanism is extremely rapid and absolutely reliable; six well aimed shots may be fired in as many seconds. The revolver is very well constructed, with finest nickel plated fluted barrel of cylinder, and it weighs only 4½ ounces. **The Price of the Revolver is only $6.50, sent by mail postpaid to any address. JOHNSON SMITH & CO.**

THE EXPO WATCH CAMERA

The most wonderful and ingenious Camera made

It is but little larger than a watch, which it closely resembles. You can carry the **Expo** about in your pocket, and take pictures without any one being the wiser.

One Cent a Picture

The Expo loads in daylight with 25 Exposure Films, costing 25c. Each one a picture, taking part of a whole day's outing may be had for the nominal sum of 25c—One cent o picture. 10 Exposure Films also obtainable. It is simplicity itself to operate. Takes pictures through the stem, where the **Rapid Fire Lens** is located. The photos (5/8 x 7/8) may be enlarged to any size.

Price $2.50

QUICK AS A FLASH

Time and instantaneous shutters! Weight but 8 ounces, nickel plated. Endorsed by amateurs and professionals the world over. Thoroughly practical—printing and developing of films just the same as ordinary cameras—daily used by the police, newspaper reporters, detectives, and the general public. Important beats have been secured with the Watch Camera by enterprising reporters. Produces clear, sharp negatives indoors or outdoors equal to those of the market, also or price notwithstanding.

Expo Watch Camera $2.50 FILMS, 10 Exposures 15c, 25 Exposures, 25c Postage 10c Anywhere Pocket Carrying Case, 35c

Johnson Smith & Co., Dept. E10, 3224 N. Halsted St., Chicago

BOYS!

Would you like to earn one of these magnificent Bicycles absolutely without costing you one cent? FREE!

HUNDREDS OF OTHER EXPENSIVE PRESENTS ALSO GIVEN

We have secured an enormous quantity of very beautiful colored pictures, consisting of art, floral, landscape, religious, patriotic, etc, and are going to sell them at less than half their value. Many stores would charge from 25 to 50 cents each for them, but a very fortunate purchase permits us to sell them at the astonishingly low price of 10 cents each, at which price they are irresistible, and will sell like hot cakes at that price.

Now all you have to do is to send us your name and address and we will send you 25 of these beautiful pictures, without any charge whatsoever. These pictures you are to sell at 10 cents each. When sold, send us the money, and we will send you records of YOUR OWN SELECTION from our 300 page catalog to the value of $2.50. Remember, you get these goods as a premium for selling the pictures and sending us the money. You don't have to pay a cent for them. Many of our agents have sold the whole 25 pictures in one day, some have sold them in the evening. One agent sold six on the way home from the post office, another sold some before he got out of the post office. Another agent sold the entire lot in one house. People are will to get these pictures once they see them, and you will have no difficulty in disposing of them if you will only show them.

Remember, you have your entire catalog to select your premiums from, and there are hundreds of useful presents such as Air Rifles, Guns, Moving Picture Machines, Musical Instruments, Cameras, Printing Presses, Typewriters, Books, Puzzles, Games, Tricks, Toys and Novelties, rubber stamps, household labor-saving devices, etc., and we are sure you would like to get many of them, especially if you can do so without having to pay any money for them.

By continuing the sale of our pictures you can earn the magnificent Bicycle illustrated. We will give you presents of equal value to the pictures you sell. Send in your application at once, and we will send you the first lot of pictures immediately, accompanied by our big catalog of over a thousand different articles to select your premiums from. You don't have to send any money. We trust you absolutely

JOHNSON SMITH & CO., Dept. E10, 3224 N. Halsted St., CHICAGO

PIANO PLAYING MADE EASY

New Vamping Card

No Teacher Needed Surprising System

Persons having perfected their Musical Education need not despair, for with the aid of our new VAMPING CARD (placing the card upright over the piano keys), you can at once play a song away to thousands of Songs, Ballads, Rag Times, etc., etc., equal to a Professional Musician. No knowledge of music is required. After using it a few times, you will be able to dispense with the aid of the Vamping Card entirely. **Only 15 cts. p. pd.** Johnson Smith & Co., Dept E10

SHARPEN-M-ALL

SAFETY RAZOR STROPPER

SHARPENS EVERY KIND OF SAFETY RAZOR BLADE

Sharpens the Gillette and Durham Duplex both edges at one time

ALSO SHARPENS THE GEM JUNIOR, EVER READY, KEEN KUTTER, MARK CROSS, CLARK, AUTOSTROP, STAR CRUSTEEL, AND ALL OTHERS

IT SHARPENS THEM ALL

By using the SHARPEN-M-ALL STROPPER, you will not only get BETTER SHAVES, but you will SAVE MONEY, as one blade can be made to get from 150 to 200 shaves from one blade, and the last shave will be as keen as the first. The construction is simple and will last a lifetime. There are no parts that can possibly get out of order. Any novice can use it just as well as the most expert barber. To use, simply turn the handle, raising the leves on handle as shown in the illustration. It has two spiral rollers that travel the full length of the strop, and are revolved, giving the CORRECT DIAGONAL STROKE. There is no adjustments, or any kind of tinkering necessary, to operate the machine. The rollers are made of a special material that STROP AND HONE the blade at the same time. The safety razor only needs to be drawn across the stropper. The SHARPEN-M-ALL is packed in a handsome case, 4x2¼x1¾ in. with three holders and full instructions. The weight of the complete machine is but eight ounces. Price, only $1.00, postpaid.

JOHNSON SMITH & CO., DEPT E10 3224 N. HALSTED STREET CHICAGO

Regain Your Health Thru Renulife VIOLET RAY Treatments at Home

Unequaled for neuritis and rheumatism

More Than 25,000 Volts
No pain, shock or muscular contraction. Entirely harmless — powerfully effective.

This type Violet Ray Instrument is designed with light handle, easily manipulated; the most of the apparatus is contained in a case giving ample space for electric units of efficient size.

There is no "quackery" or uncertainty about *Renulife Violet Ray.* It is not claimed to be a "Cure All," but it has proved in thousands of cases a practical health-producing, revitalizing agent—powerful in restoring normal physical conditions—yet gentle, soothing and perfectly safe. *You* can treat yourself. Get full information regarding uses shown on coupon below.

Users Get Wonderful Results

(Voluntary Testimonials)

"The Renulife Violet Ray High Frequency Generator is superior in efficiency because of its perfect character and control of current, compactness and perfect insulation. The smallness and lightness of Electrode holder is also a great advantage." "The doctor told me that the trouble was hardening of the arteries. I wish I had got it a year ago. I would not be without it for all the money in the world." "I cannot recommend it too highly." "I have been using mine now for a week for Sciatica and I am highly pleased with results." "I think it is one of the best little machines that was ever invented." "I have used it with excellent results for the restoration of hair and stiff and sore rheumatic finger joints." "Am well pleased with the Generator, and the kind treatment received from your Company." "My Generator has stopped my neuritis." "Every house should have a Renulife Violet Ray High Frequency Generator, for the treatment of Neuralgia, Neuritis, Sore Throat, Kernels in Neck, Cramps, Headache, Stiff Neck, Muscular Soreness, Rheumatism, Paralysis—in short, pains of all kinds."—M. D. "I have been much relieved by the use of your Violet Ray Generator." "It is fine for Insomnia." "I find it such a help in nervousness." "I would not part with it for five times the price. It is sure a little wonder." "I am more than pleased with the Generator; the whole family are using it." "A neighbor lady was suffering from lumbago and could not move, and my wife brought over the Generator and in less than ten minutes the lady was greatly relieved." "Your Generator is just the thing for me. That tired feeling has left me, and I feel like myself again." "It has relieved me of the nervousness and also it has helped me a great deal in using it for the treatment of rheumatism."

How Renulife Benefits

Science has demonstrated a strange relation between electricity and life cells. This instrument harnesses a tremendous current of electricity and applies in the form of Violet Rays so that the body welcomes and responds to it in a marvelous manner—no pain—shock or the slightest harmful effects. A few seconds of Renulife Violet Ray gives more benefit than hours of the old time battery methods—because a thousand times as much voltage is made use of.

The irresistible, revitalizing powers of *Renulife Violet Ray* reach every nerve cell, fibre and part of body. Blood is enriched and purified by a flood of oxygen, giving added vitality and strength. Assimilation and digestion improved—functions retored to normal—extra supply of fresh blood quickly brought to area treated, removing congestion and supplying nourishment. While relieving pains and aches, the manifest results of disorders, it removes the deep seated cause, combines the benefits of electricity, vibration, exercise, stimulation and oxidation.

Get Book "Health via Violet Ray"

Learn the whole marvelous story of the Violet Ray—this method that works with nature to restore and build up. Learn how you, at home, can now use these great curative forces of Violet Ray—heretofore only available at big expense from physicians or beauty doctors. Send coupon or postal card now and receive free book describing uses, quoting low prices (within the reach of all) and explaining liberal *Trial Plan.*

Orono, Maine
EAK 760.52

A Direct Route to BIGGER PAY

NO MONEY DOWN

SMALL MONTHLY PAYMENTS

THROUGH ELECTRICITY you can earn more. The salary of the electrical worker is steadily advancing. Especially is this true of those who are educating themselves in the finer points of electrical practice.

Fit yourself for one of the really big jobs by knowing electrical practice complete, including inside and outside work, central stations, and the whole subject. It takes long years to do this in practice only, whereas, with the aid of the CROFT LIBRARY OF PRACTICAL ELECTRICITY it takes only months.

No matter how much nor how little you know of electricity, the Croft Library will be found of assistance every day. You will immediately recognize the fact that the author is a practical man. You will immediately see the great difference between these and other books on the subject you possess.

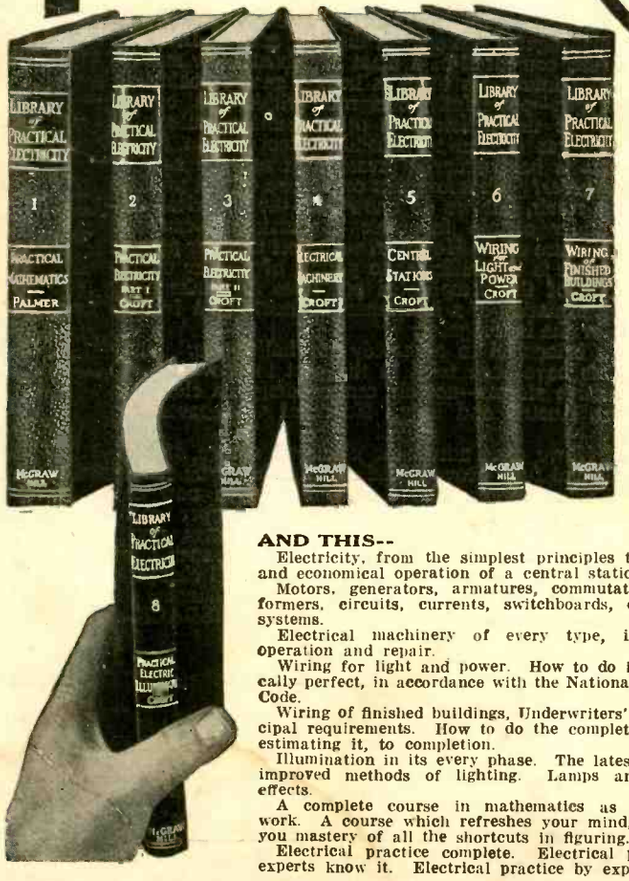
READ THIS—

McGraw-Hill Book Company, Inc.,
239 West 39th Street, New York, N. Y.

Gentlemen: In an attempt to express myself about CROFT'S NEW LIBRARY OF PRACTICAL ELECTRICITY, I have never seen and do not believe there was ever printed in the English language, a more comprehensive set of books. It is a library that is just as valuable to the novice as to the expert, because it is all practice.

Respectfully,

GUY H. PEIFER.
Chief, Doplan Silk Corporation, Hazelton, Pa.



ELECTRICAL PRACTICE COMPLETE

AND THIS—

McGraw-Hill Book Co., Inc.,
239 W. 39th St.,
New York.

Gentlemen: The CROFT LIBRARY OF ELECTRICITY more than came up to my expectations. I have been in the electrical business for fifteen years, and know the general run of electrical books. Terrell Croft's Library is the best I have had the pleasure of examining.

Yours truly,
EDWARD T. HOFF,
713 3rd Ave.,
Asbury Park, N. J.

The Croft Library adheres closer to actual practice than anything of the kind ever attempted. It is the most complete set of books on electricity ever published. It is clearest in word and illustration. It has no equal in every-day helpfulness. It cannot be compared in any way with other sets of books on this subject.

Just return the coupon—

Fill out the coupon below and return to us. We will immediately send the eight volumes, charges prepaid, for ten days' use in connection with your work. Don't bother to send any money. We do not want a cent from you until you have examined the books and decided that they are a direct route to bigger pay. Then you can send us $2 per month for eight months.

McGraw-Hill Book Co., Inc.
239 West 39th St., New York

MAIL THIS COUPON TO-DAY

AND THIS--

Electricity, from the simplest principles to complete and economical operation of a central station.

Motors, generators, armatures, commutators, transformers, circuits, currents, switchboards, distribution systems.

Electrical machinery of every type, installation, operation and repair.

Wiring for light and power. How to do it mechanically perfect, in accordance with the National Electrical Code.

Wiring of finished buildings, Underwriters' and municipal requirements. How to do the complete job from estimating it, to completion.

Illumination in its every phase. The latest and most improved methods of lighting. Lamps and lighting effects.

A complete course in mathematics as applied to work. A course which refreshes your mind, and gives you mastery of all the shortcuts in figuring.

Electrical practice complete. Electrical practice as experts know it. Electrical practice by experts.

McGraw-Hill Book Co., 239 W. 39th St., New York

Gentlemen:—Please send me the Library of Practical Electricity (shipping charges prepaid), for 10 days' free examination. If satisfactory, I will send $2 in ten days and $2 per month until $16 has been paid. If not wanted, I will write you for return shipping instructions.

EDITORIAL

HAIL

EVERY year millions of dollars' worth of crops and property are destroyed by hailstorms. Not infrequently human beings and cattle are killed, due to their inability to reach shelter in time. Of course such occurrences are not very frequent, which is explained by the fact that the average size of a hailstone is not much larger than a small hazelnut. But hailstones the size of a man's fist are by no means uncommon. Stones weighing two pounds have been observed, but these are very rare. But whatever their size or weight, hailstones are exceedingly destructive. Hurled from a great height, with a powerful wind accelerating their own speed, these frozen ice-pellets destroy vegetation at an appalling rate annually. Fruit on trees, crops and all vegetables are mowed down over great areas several times each year.

In the United States there is an average of over three hailstorms a year—Ohio leading with over ten such storms annually. Now the curious and outstanding fact about hailstorms is that nearly all of them occur during the summer, and practically none occur without thunder and lightning. There is nothing new contained in this statement—every child knows it. But here the writer would like to inject a new thought: namely, that the formation of hailstones is directly due to certain and as yet not clearly understood electrical processes. In other words, the formation of these round ice stones is the product of the electric current or static electricity.

This theory can be upheld by a few very simple arguments. In the first place, the height at which hail-clouds move is very low—never high enough to permit water to freeze. Proof: During all hailstorms rain always falls amid the hailstones, *and this rain is quite warm.* If the hail were formed by a sudden cold air wave, as our text-books want us to believe, where do the warm raindrops come from—or why does it not snow at least? However, it never does, particularly during the summer season.

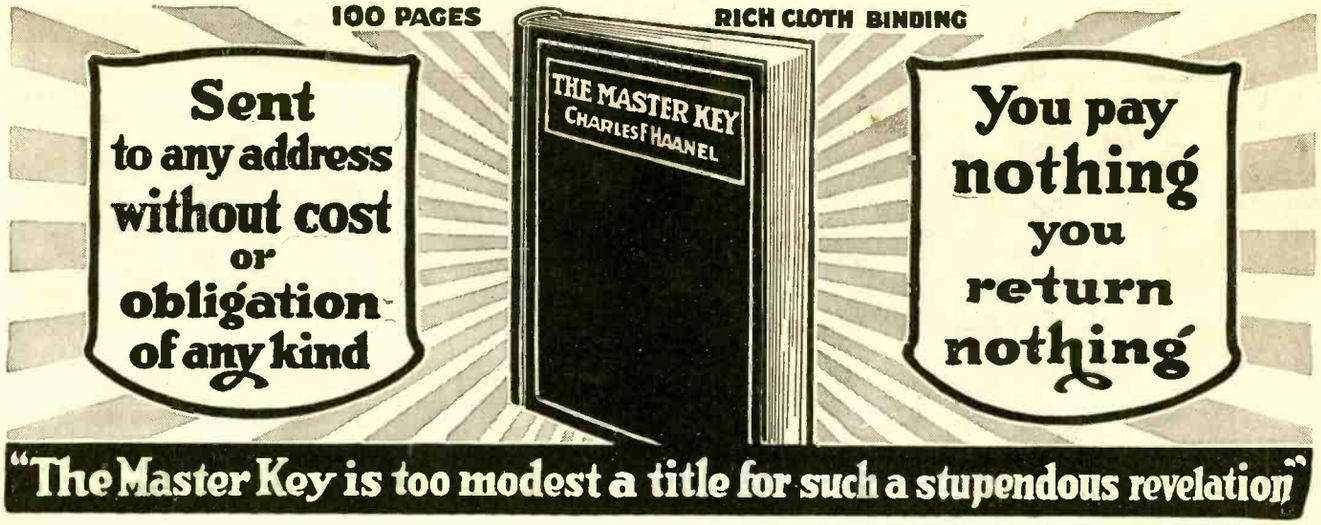
But this is not all of the story. According to Jaentr, who investigated the subject thoroly, each hailstone is, as a rule, composed of a mass of mixed snow and ice in whose interstices there is held a gas—probably air or oxygen—powerfully comprest within the central cavity. If the hailstone is opened under water, the enclosed gas is seen to expand. According to Jaentr this gas is held under a pressure of as high as *fifty atmospheres!* We know that cold alone cannot produce such a result, but we do know that the electrical current under certain favorable circumstances can and does produce cold. However, we admit that our present knowledge is not sufficient to permit of a clear understanding of the complicated processes that take place in the formation of a hailstone. It should be a fruitful field for the investigator.

This brings us to a remedy for hailstorms. Many methods have been tried in the past to prevent these destructive storms—notably cannonading the clouds in France, Austria and Italy. No relief whatsoever was had.

But if we once admit the electrical nature of hailstorms and fully prove it, the remedy should be simple. Huge kites, larger than those built up to now and capable of carrying a thick, stranded copper cable, should be sent aloft immediately when storm clouds gather. At a ridiculously low cost a dozen such kites, spaced a mile apart, could draw the electrical charge to earth, thus emptying the clouds of their danger. It is worth a trial at least.

H. GERNSBACK.

The ELECTRICAL EXPERIMENTER is publisht on the 15th of each month at 233 Fulton Street, New York. There are 12 numbers per year. Subscription price is $2.00 a year in U. S. and possessions. Canada and foreign countries, $2.50 a year. U. S. coin as well as U. S. stamps accepted (no foreign coins or stamps). Single copies, 20 cents each. A sample copy will be sent gratis on request. Checks and money orders should be drawn to order of EXPERIMENTER PUBLISHING CO., INC. If you change your address notify us promptly, in order that copies are not miscarried or lost. A green wrapper indicates expiration. No copies sent after expiration.



All communications and contributions to this journal should be addrest to: Editor, ELECTRICAL EXPERIMENTER, 233 Fulton Street, New York. Unaccepted contributions cannot be returned unless full postage has been included. ALL accepted contributions are paid for on publication. A special rate is paid for novel experiments; good photographs accompanying them are highly desirable.

ELECTRICAL EXPERIMENTER, Monthly. Entered as second-class matter at the New York Post Office under Act of Congress of March 3, 1879. Title registered U. S. Patent Office.

Copyright, 1919, by E. P. Co., Inc., New York. The Contents of this magazine are copyrighted and must not be reproduced without giving full credit to the publication.

The ELECTRICAL EXPERIMENTER is for sale at all newsstands in the United States and Canada; also at Brentano's, 37 Avenue de l'Opera, Paris.

Member of the Audit Bureau of Circulation.

SOME men and women seem to attract success, power, wealth, health and attainment with very little conscious effort; others conquer with great difficulty, still others fail altogether to reach their ambitions, desires and ideals.

Why is this so?

"The Master Key" will tell you why. No one can read it and not be a changed man or woman. None but who will emerge from its magic pages with a firmer grasp of the future—a surer understanding of what he can do.

"The Master Key" is a key with which many are converting loss into gain, fear into courage, despair into joy, hope into fruition.

A copy of this magnificent, richly bound 128 page book will be sent to you, without cost or obligation of any kind, if you address

Charles F. Haanel, 423 Granite Bldg., St. Louis, Mo.

You should send for a Master Key.

New Way to Learn

The World's Greatest ELECTRICAL BOOKS

IT'S no longer necessary to serve an apprenticeship or go to school to learn electricity. With this new library of PRACTICAL APPLIED ELECTRICITY you learn right at home—in your spare time without interfering with your present work. You can pick out any good, paying job that requires a trained man and fit yourself to fill it in a very short time by spending an hour or two a day with these books. There's no tiresome lessons and a lot of higher mathematics for you to wade through. No theory and historical data that you will never use. Nothing but plain English and common everyday figures anybody can understand. It's a home study course for the beginner and a handy reference guide for the expert combined.

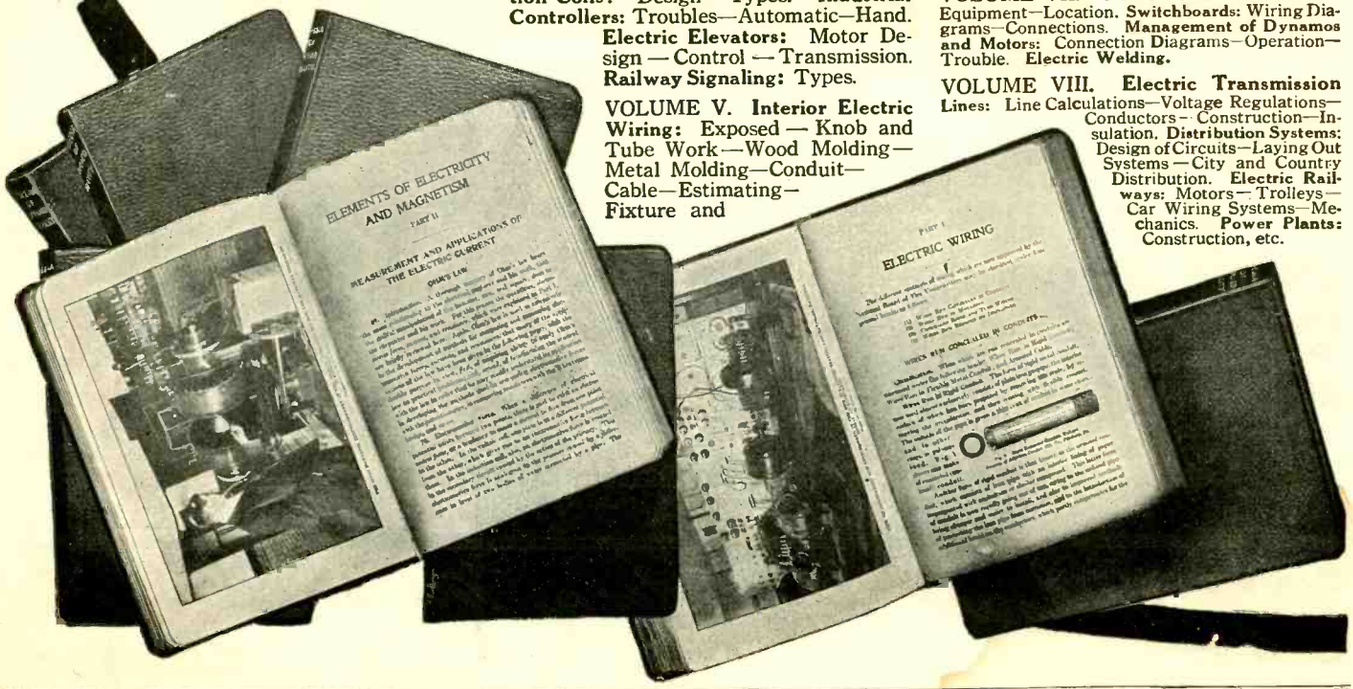
Here Is What You Learn

Here are 100 different subjects selected at random from the eight big volumes. This is just a small part of the total number of things explained. Several thousand propositions are treated.

VOLUME I. **Elements of Electricity:** Magnetism—Static Electricity—Current Electricity—Battery Circuits—Electromagnets—Principles of Dynamos and Motors—Induction Coils—Telephone Principles. **Principles of D. C. Dynamos:** Field Magnets—Armatures—Voltage Regulation. **Principles of D. C. Motors:** Comparison with Generator—Operation—Design. **Storage Batteries:** Maintenance—Commercial Applications.

VOLUME II. **Alternating Current Machinery:** Instruments—Armature Windings—Regulation—Output—Tests—Commercial Types—A. C. to D. C. Current—Converters—Switchboards—Synchronizers.

VOLUME III. **D. C. Dynamo Design:** Efficiency—General Principles. **Armature Winding:** Calculations. **Design of Small Motors:** D. C. Design—A. C. Design—Induction Motor Design. **Transformers:** Operation—Efficiency—Construction.



VOLUME IV. **Electrical Measurements and Meter Reading:** Instruments—Methods—Voltage—Current—Testing—Watt-Hour Meters. **Electromagnets and Induction Coils:** Design—Types. **Industrial Controllers:** Troubles—Automatic—Hand. **Electric Elevators:** Motor Design—Control—Transmission. **Railway Signaling:** Types.

VOLUME V. **Interior Electric Wiring:** Exposed—Knob and Tube Work—Wood Molding—Metal Molding—Conduit—Cable—Estimating—Fixture and Fixture Wiring—Theatres—Moving Picture Machines—Materials. **Underwriters Requirements:** National Electric Code—**Outside Wiring:** High-tension Lines—Ground Circuits—Controlling and Protecting Devices.

VOLUME VI. **Electric Lighting:** Planning Systems—Cost—Estimating. **Interior Lighting:** Offices—Stores—Windows—Factories—Residences. **Exterior Lighting: Railway Car Lighting:** Material—Maintenance. **Applied Electrochemistry:** Electric Furnaces—Metal Refining.

VOLUME VII. **Power Stations:** Cost—Equipment—Location. **Switchboards:** Wiring Diagrams—Connections. **Management of Dynamos and Motors:** Connection Diagrams—Operation—Trouble. **Electric Welding.**

VOLUME VIII. **Electric Transmission Lines:** Line Calculations—Voltage Regulations—Conductors—Construction—Insulation. **Distribution Systems:** Design of Circuits—Laying Out Systems—City and Country Distribution. **Electric Railways:** Motors—Trolleys—Car Wiring Systems—Mechanics. **Power Plants:** Construction, etc.

Electricity

Electricity of Tomorrow
Very Latest Methods

THIS is the 1920 edition—new from cover to cover—every one of the eight big volumes is chuck full of the latest methods and discoveries in this fascinating field. 27 of the greatest electrical engineers and experts in the business wrote these books just to help you who are interested in electricity realize your ambitions. To make you successful. It's not one man's ideas and experience, but the combined knowledge of the world's greatest electrical master minds. The seven volumes bound in genuine, flexible American Morocco, contain 3800 pages and more than 3000 pictures, diagrams, etc., illustrating everything known to electricity. See the list of things the books teach you—the list of big jobs that are open to men with the "know how" and our FREE offer that puts the whole set in your home for a week without costing you a cent.

Big Pay for Trained Men

Jobs paying from $1500.00 to $5000.00 yearly are waiting for men who can qualify as Electrical Engineers—Substation Operators—Trouble Men—Switchboard Operators—Dynamo Tenders—Electricians

Practical Knowledge Always in Demand

Electricity is the greatest force in the world and it is growing bigger and bigger every day. The multitude of uses it is now put to and the marvelous things it does for us is as nothing compared to what it will be in a few years from now. Just think what it means to us in our simple daily life. It runs our street cars and automobiles. It makes the telephone and tele graph possible. It lights our homes and gives us the "movies" too. Thousands of men—highly paid men—are needed to handle this wonderful force. Why don't you get into this big paying field now?

Good Jobs Waiting for Men Who Know

If you are trained in some branch of electricity you will never have to look for a job. The job and the big pay that goes with it will be looking for you. You can't dodge a good job if you have the "know how" under your hat. Don't go along year after year depending on a small raise now and then. It takes a lifetime to get you anywhere that way. Learn electricity and JUMP ahead. Let these 27 great engineers help you on your way with their books. Sending the coupon below is your first jump on the road to real success.

FREE Examination—No Risk

You can have this wonderful library to use in your own home or shop for a whole week FREE. It won't cost you one cent. DON'T SEND ANY MONEY. Just fill out and mail the coupon today and the entire set of eight volumes will come to you by express collect. You be the judge and find out for yourself what the books will do for YOU. Use them as you please. Go into every volume thoroughly. Show them to your friends and get their opinion. Then, if you have any doubt about their value, send them back at our expense; you won't owe us anything. If you like the books after a week's examination, you pay us only $2.00 and the same amount every month until $24.80 is paid. This is only 50 cents a week or 7 cents a day. Most of us waste more than this every day of our lives. Can you afford to pass up a better job and higher wages when it costs only 7 cents a day for a short time to get it? Of course you can't. Mail the Coupon Now—TODAY.

Only 7 cents a day

Special Offer!

A membership in this Society costs $12.00 a year, but we will give a one year membership FREE to everyone who buys a set of these books. This gives you the right to consult the engineers the Society retains on any electrical subject at any time. Write as often as you please. Ask as many questions as you please.

American Technical Society Dept. E-256 Chicago

AMERICAN TECHNICAL SOCIETY, Dept. E-256 Chicago

Send me the eight volume library of PRACTICAL APPLIED ELECTRICITY for a week's free examination by express collect. I will either send you $2.00 within a week as first payment and $2.00 each month until $24.80 is paid, or return the books at your expense. If I keep the books I am entitled to a one year membership in your Society free.

What "Radio Amateur News" Is:

With its third issue RADIO AMATEUR NEWS holds the field undisputedly as the greatest radio magazine in print today. In point of circulation, number of articles, illustrations, RADIO AMATEUR NEWS now leads all other wireless magazines. Take for instance the August issue with its forty-eight pages; there were thirty-nine separate purely radio articles and 115 illustrations. *Over twenty thousand copies were printed and circulated.*

Each issue of the RADIO AMATEUR NEWS now contains 48 pages (or more) and an artistic cover in two colors. The illustrations average 125 every month and there are from 40 to 50 up-to-date articles, some by our biggest radio scientists, in every issue.

RADIO AMATEUR NEWS is the greatest and biggest radio magazine in print today.

RADIO AMATEUR NEWS is the only INDEPENDENT monthly wireless magazine in existence. It caters to no commercial interests—it has no boss save its readers. It is "different"—it has the latest radio news. It is a scientific magazine but it caters largely to the RADIO AMATEUR—it is by and for the Amateur. It is publisht by the publishers of the ELECTRICAL EXPERIMENTER, but there will be no duplication of articles in the two magazines. Both are entirely different—but both together will give you ALL the radio news of all the world. Whether you are a professor or an Amateur, get a sample copy or order it from your Newsdealer today.

Junior Radio Course

By E. T. JONES
Associate Editor

A distinctly new feature begins with the September issue in our new **Junior Radio Course.** In this issue Lesson No. 1 will appear complete. This course is intended for the beginner and everything presented will be in plain English, even the merest tyro in radio will find no trouble in understanding and assimilating the knowledge. The series is a very important one and nothing like it has ever appeared in print before. Everyone owes it to himself in this new age to know something about wireless and this course will enlighten all laymen. Profusely illustrated with pictures that anyone can understand.

in "Up in Mabel's Room"

Are You a Blond?

The Secret of Making People Like You

Wallace Reid
Star in "The Valley of the Giants"
A Paramount-Artcraft Picture

THE greatest asset any man can possibly have is the faculty for making people like him. It is even more important than ability.

The secret of making people like you lies in your ability to understand the emotional and mental characteristics of the people you meet.

Did you know that a blonde has an entirely different temperament than a brunet?—that to get along with a blond type you must act entirely different than you would to get along with a brunet?

When you really know the difference between blonds and brunets, the difference in their characters, temperaments, abilities and peculiar traits you will save yourself many a mistake—and you will incidently learn much you never knew before about yourself.

* * * * * * *

PAUL GRAHAM was a blond, and not until he learned that there was all the difference in the world between the characteristics of a blond and those of a brunet did he discover the secret of making people like him.

Paul had been keeping books for years for a large corporation which had branches all over the country. It was generally thought by his associates that he would never rise above that job. He had a tremendous ability with figures—could wind them around his little finger—but he did *not* have the ability to mix with big men; did *not* know how to make people like him.

Then one day the impossible happened. Paul Graham became popular.

Business men of importance who had formerly given him only a passing nod of acquaintance suddenly showed a desire for his friendship. People—even strangers—actually went out of their way to do things for him. Even *he* was astounded at his new power over men and women. Not only could he get them to do what he wanted them to do, but they actually anticipated his wishes and seemed eager to please him.

From the day the change took place he began to go up in business. Now he is the Head Auditor for his corporation at an immense increase in salary. And all this came to him simply because he learned the secret of making people like him.

You, too, can have the power of making people like you. For by the same method used by Paul Graham, you can, at a glance, tell the characteristics of any man, woman or child—tell instantly their likes and dislikes, and YOU CAN MAKE PEOPLE LIKE YOU: Here is how it is done.

Everyone you know can be placed in one of two general types—blond or brunet. There is as big a difference between the mental and emotional characteristics of a blond and those of a brunet as there is between night and day. You persuade a blond in one way—a brunet in another. Blonds enjoy one phase of life—brunets another. Blonds make good in one kind of a job—brunets in one entirely different.

To know these differences scientifically is the first step in judging men and women; in getting on well with them; in mastering their minds; in making them like you; in winning their respect, admiration, love and friendship.

And when you have learned these differences—when you can tell at a glance just what to do and say to make any man or woman like you, your success in life is assured.

For example, there's the case of a large manufacturing concern. Trouble sprang up at one of the factories. The men talked strike. Things looked ugly. Harry Winslow was sent to straighten it out. On the eve of a general walkout he pacified the men and headed off the strike. And not only this, but ever since then, that factory has led all the others for production. He was able to do this, because he knew how to make these men like him and do what he wanted them to do.

Another case, entirely different, is that of Henry Peters. Because of his ability to make people like him—his faculty for "getting under the skin" and making people think his way, he was given the position of Assistant to the President of a large firm. Two other men, both well-liked by their fellow employees, had each expected to get the job. So when the outside man, Peters, came in, he was looked upon by everyone as an interloper and was openly disliked by every other person in the office.

Peters was handicapped in every way. But in spite of that, in three weeks he had made fast friends of everyone in the house and had even won over the two men who had been most bitter against him. The whole secret is that he could tell in an instant how to appeal to any man and make him well-liked.

A certain woman who had this ability moved with her family to another town. As is often the case, it is a very difficult thing for any woman to break into the chill circle of society in this town, if she was not known. But her ability to make people like her soon won for her the close friendship of many of the "best families" in the town. Some people wonder how she did it. It was simply the secret at work—the secret of judging people's character and making them like you.

* * * * * * *

YOU realize, of course, that just knowing the difference between a blond and a brunet could not accomplish all these wonderful things. There are other things to be taken into account. But here is the whole secret.

You know that everyone does not think alike. What one likes another dislikes. What pleases one offends another. And what offends one pleases another. Well, there is your cue. You can make an instant "hit" with anyone, if you say the things they want you to say, and act the way they want you to act. Do this and they will surely like you and believe in you and will go miles out of their way to PLEASE YOU.

You can do this easily by knowing certain simple signs. In addition to the difference in complexion, every man, woman and child has written on them signs as distinct as though they were in letters a foot high, which show you from one quick glance exactly what to say and to do to please them—to get them to believe what you want them to believe—to think as you think—to do exactly what you want them to do.

Knowing these simple signs is the whole secret of getting what you want out of life—of making friends, of business and social advantage. Every great leader uses this method. That is why he IS a leader. Use it yourself and you will quickly become a leader—nothing can stop you.

You have heard of Dr. Blackford, the Master Character Analyst. Many concerns will not employ a man without first getting Dr. Blackford to pass on him. Concerns such as Westinghouse Electric and Manufacturing Company, Baker, Vawter Company, Scott Paper Company and many others pay Dr. Blackford large annual fees for advice on dealing with human nature.

So great was the demand for these services that Dr. Blackford could not even begin to fill all the engagements. So Dr. Blackford has explained the method in a simple, seven-lesson course, entitled, "Reading Character at Sight." Even a half hour's reading of this wonderful course will give you an insight into human nature and a power over people which will surprise you.

Such confidence have the publishers in Dr. Blackford's course, "Reading Character at Sight," that they will gladly send it to you on approval, all charges prepaid. Look it over thoroughly. See if it lives up to all the claims made for it. If you do not want to keep it, then return it and the transaction is closed. And if you decide to keep it—as you surely will—then merely remit five dollars in full payment.

Remember, you take no risk, you assume no obligation. The entire course goes to you on approval. You have everything to gain—nothing to lose. So mail the coupon NOW, and learn how to make people like you, while this remarkable offer is still open.

"The Joy of Father and Boy."

Chemical Laboratory

We present herewith to our friends our new **E. I. Co. Chemical Laboratory** which contains **real** chemicals and apparata to perform **real** chemical experiments. This outfit is not a toy, put up merely to amuse, but a practical laboratory set, with all the chemicals, apparata and reagents necessary to perform real work and to teach the beginner all the secrets of inorganic chemistry. With this outfit we give free a book containing a **Treatise in Elementary Chemistry, useful data and recipes, and 100 instructive and amusing experiments.**

DESCRIPTION OF THE OUTFIT:

The outfit consists of forty-four (44) Chemicals all C. P. (chemical pure) put up in appropriate wooden boxes, glass bottles, and hermetically closed jars. The acids are put up in glass bottles, with ground-in glass stoppers and there is a sufficient quantity of chemicals supplied (mostly one to two ounces) enough to make dozens of experiments with each. See list of Chemicals herewith.

The apparata furnished are all of the best obtainable make and of standard laboratory size and shape. A list of the 17 pieces of apparata furnished with this outfit is printed also herewith.

The Instruction book is a real Chemistry Course for the Beginner. Some of the Contents are: **Division of Matter:** This is a Treatise on Elementary Chemistry and deals with the theory of the Elements, Molecules and Atoms, etc. **Chemical Nomenclature:** This explains in simple language the derivation of the chemical names of the Elements and their compounds. There is a chapter on **Laboratory Operations; Glass Working; First Aid; Fire Extinguishers; Experimenters' Aphorisms,** etc.

A good part of the book is devoted to Weights and Measures. The Metric System, the English system and the U. S. System are fully explained.

The following tables are furnished: Symbols and Atomic weights of the Elements; Measures of Weights. Volume, Capacity and Length; Per Cent solutions; Conversion of Measure expressed in parts; Poisons and their antidotes; Technical and common name of chemical substances; Formulas for Cleaning various substances, etc., etc.

Among the **100 Experiments** are:

How to make chemical tricks; How to make invisible and magic inks; How to test flour; How to test soil; How to Make Chlorine Gas and smoke (German War Gas); How to bleach cloth and flowers. How to produce Oxygen and Hydrogen; How to make chemical colors; How to test Acids and Alkalies and hundreds of interesting hints and formulas.

The price is still $5.00. **Shipping Weight 10 lbs.** **(Can be shipped by Express only.)**

It contains the following 44 chemicals:

Alum $Al_2(SO_4)_3$, $(NH_4)_2SO_4$
Antimony (powdered) (Sb)
Ammonium Aqua (NH_3+H_2O)
Ammonium Carbonate $(NH_4)_2\ CO_3$
Ammonium Chloride (NH_4Cl)
Ammonium Sulphate $(NH_4)_2\ SO_4$
Barium Chloride ($BaCl_2$)
Boric Acid (H_3BO_3)
Brimstone (Sulphur) (S)
Calcium Chloride ($CaCl_2$)
Calcium Oxide (CaO)
Calcium Sulphate $(CaSO_4 2H_2O)$
Charcoal (Carbon) (C)
Chloride of Zinc ($ZnCl_2$)
Copper Sulphate ($CuSO_4$)
Ferrous Sulphate ($FeSO_4$)
Ferrous Sulphide (FeS)
Glycerol (Glycerine) $C_3H_5(OH)_3$
Hydrochloric Acid (HCl)
Iodine (I)
Iron Chloride ($FeCl_2$)
Iron Oxide (Fe_2O_3)
Lead Acetate Pb $(C_2H_3O_2)_2$
Litmus Paper
Magnesium Carbonate ($MgCO_3$)
Manganese Dioxide (MnO_2)
Mercury (Quicksilver) (Hg)
Nickel Chloride ($NiCl_2$)
Oxalic Acid ($H_2C_2O_4$)
Sodium Bicarbonate ($NaHCO_3$)
Sodium Borate ($NaBO_2$)
Sodium Carbonate (Na_2CO_3)
Sodium Chloride (NaCl)
Sodium Nitrate ($NaNO_3$)
Sodium Phosphate (Na_2HPO_4)
Sodium Sulphate (Na_2SO_4)
Sodium Sulphite (Na_2SO_3)
Stannous Chloride ($SnCl_2$)
Sulphate of Nickel ($NiSO_4$)
Sulphate of Zinc ($ZnSO_4$)
Sulphuric Acid (H_2SO_4)
Tin (Granulated) (Sn)
Zinc (Metal) (Zn)
Zinc Carbonate ($ZnCO_3$)

The following apparata are furnished:

One Standard Washbottle
One Alcohol Lamp
One Conical Glass Measure
One Erlenmeyer Flask
One Glass Funnel
One Delivery Tube
Six Assorted Test-Tubes
One Test-Tube Holder
Ten Sheets of Filter Paper
One Glass Dropper
One Spoon Measure
Glass Tubing
One book containing Treatise on Elementary Chemistry and 100 Chemical Experiments to be performed with this outfit.

FREE Cyclopedia No. 20 measures 7x5¼". Weight ½ lb. Beautiful stiff covers.

"Out they came, the financier patting Preston on the shoulder in a fatherly sort of way. . . . 'Come to see me as often as you can, Mr. Preston, and remember that I'll back you to the limit.'"

The Most Convincing Talker I Ever Met

Everywhere this man goes, people shower him with favors and seek his friendship. Things which other people ask for and are refused, he gets instantly. How he does it is told in this amazing story.

LET me ask you this: There is a big business deal to be put through. It involves millions of dollars. Putting it through depends wholly on one thing—getting the backing of a great financier.

But this man is bitterly opposed to your idea and to your associates. Seven of the most able men and women in all America have tried to win over this financier. They failed dismally and completely.

Now, could you, a total stranger to this man, walk in on him unannounced, talk for less than an hour, and then have him take your arm as a token of friendship, and give you a signed letter agreeing to back you to the limit?

Could you?

ASTOUNDING? Yes! But it *WAS* done. And I'll tell you how. Here is the way it all came about. For a long time the directors of our company had felt the handicap of limited capital. We had business in sight running into a million dollars a month. But we couldn't finance this volume of sales. We simply had to get big backing, and that was all there was to it.

Because of trade affiliations, one man—a great financier in New York—controlled the situation. Win him over and the rest was easy. But how to win him?—that was the question. No less than five men and two women—all people of influence and reputation—had tried. They were all repulsed—turned down cold and flat.

You know how a thing of this sort grows on you and how bitter utter defeat is. Well, we were talking it over at a board meeting when one of our directors announced that he knew of only one man who could possibly put through the deal—a man by the name of Preston.

So it was agreed that Preston was to be sounded out at luncheon the following day. He proved to be a fine type of American. At 34 years of age he had become president and majority stockholder of a thriving manufacturing business rated at three-quarters of a million dollars.

Preston was deeply interested, as anyone would be over the prospect of closing such a big deal. The director in question said casually, "Why don't you run down to New York and take a shot at it, Preston?" Preston looked out of the window for a moment, and then quietly answered, "You're on."

I WENT along with Preston simply as a matter of form to represent our interests. Aboard the 10:25 train out of Chicago we headed for the smoker and got to talking with the crowd there.

Then I noticed something. Preston had dominated them all. Everyone was eagerly hanging on his words, and looking at him with open admiration. No sooner would he stop talking than one of the men would start him up again. And as the men dropped off at stations along the way they gave Preston their cards, with pressing invitations to look them up. No doubt about it, Preston was *THE* man aboard that car.

The colored porter, too, came under his sway. For that night, when the berths were being made up, the porter came unasked to Preston, told him that his berth was right over the car trucks, and insisted upon changing it to a more comfortable one.

And so it went all the way to New York. Everyone who met Preston took a great liking to him the instant he spoke. They seemed to be eager for his companionship—wanted to be with him every minute, openly admired him, and loaded him with favors.

Even the usual haughty room clerk at the hotel showed a great interest in Preston's welfare. He showered us with attention while a long line of people waited to register.

The next morning we called on the great financier—the man who was so bitterly against us and had flatly turned down seven of our shrewd influential representatives.

I waited in the reception room—nervous, restless, with pins and needles running up and down my spine. Surely Preston would meet the same humiliating fate?

But no! In less than an hour out they came, arm in arm, the financier patting Preston on the shoulder in a fatherly sort of way. And then I heard the surprising words, "Come to see me as often as you can, Mr. Preston, *and remember that I'll back you to the limit!*"

AT the hotel that night sleep wouldn't come. I couldn't get the amazing Preston out of my thoughts. What an irresistible power over men's minds he had. Didn't even have to ask for what he wanted! People actually competed for his attention, anticipated his wishes and eagerly met them. What a man! What power! . . . Then the tremendous possibilities of it all—think what could be done with such power!

What was the secret? For secret there must be. So the first thing next morning I hurried to Preston's room, told him my thoughts, and asked him the secret of his power.

Preston laughed good-naturedly. "Nothing to it—I—well—that—is—" he stalled. "I don't like to talk about myself, but I've simply mastered the knack of talking convincingly, that's all."

"But how did you get the knack?" I persisted.

Preston smiled, and said, "Well, there's an organization in New York that tells you exactly how to do it. *It's amazing!* There's really nothing to study. It's mostly a knack which they tell you. You can learn this knack in a few hours. And in less than a week it will produce definite results in your daily work.

"Write to this organization—The Independent Corporation—and get their method. They send it on free trial. I'll wager that in a few weeks from now you'll have a power over men which you never thought possible . . . but write and see for yourself." And that was all I could get out of the amazing Preston.

WHEN I returned home I sent for the method Preston told me about. It opened my eyes and astounded me. Just how he had won over the financier was now as clear as day to me. I began to apply the method to my daily work, and soon I was able to wield the same remarkable power over men and women that Preston had. I don't like to talk about my personal achievements any more than Preston does, but I'll say this:

When you have acquired the knack of talking convincingly, it's easy to get people to do anything you want them to do. That's how Preston impressed those people on the train—how he got special attention from the hotel clerk—how he won over the financier—simply by talking convincingly.

This knack of talking convincingly will do wonders for any man or woman. Most people are afraid to express their thoughts; they know the humiliation of talking to people and of being ignored with a casual nod or a "yes" or "no." But when you can talk convincingly, it's different. *When you talk people listen and listen eagerly.* You can get people to do almost anything you want them to do. And the beauty of it all is that they think they are doing it of their own free will.

In committee meetings, or in a crowd of any sort you can rivet the attention of all when you talk. You can force them to accept your ideas. It helps wonderfully in writing business letters — enables you to write sales letters that amaze everyone by the big orders they pull in.

Then again it helps in social life. Interesting and convincing talk is the basis of social success. At social affairs you'll always find that the convincing talker is the centre of attraction, and that people go out of their way to "make up" to him.

Talk convincingly and no man—no matter who he is—will ever treat you with cold, unresponsive indifference. Instead, you'll instantly get under his skin, make his heart glow and set fire to his enthusiasms. Talk convincingly and any man—even a stranger—will treat you like an old pal and will literally take the shirt off his back to please you.

You can get anything you want if you know how to talk convincingly. You've noticed that in business ability alone won't get you much. Many a man of real ability, who cannot express himself well, is often outdistanced by a man of mediocre ability who knows how to talk convincingly. There's no getting away from it, to get ahead—merely to hold your own—to get what your ability entitles you to, *you've got to know how to talk convincingly!*

THE method Preston told me about is Dr. Law's "Mastery of Speech," published by the Independent Corporation. Such confidence have the publishers in the ability of Dr. Law's method to make you a convincing talker that they will gladly send it to you wholly on approval.

You needn't send any money—not a cent. Merely mail the coupon, or write a letter, and the complete Course "Mastery of Speech," will be sent you by return mail, all charges prepaid. If you are not entirely satisfied with it, send it back any time within five days after you receive it and you will owe nothing.

But if it pleases you, as it has pleased thousands of others, then send only five dollars in full payment. You take no risk. You have everything to gain and nothing to lose. So mail the coupon now before this remarkable offer is withdrawn.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates

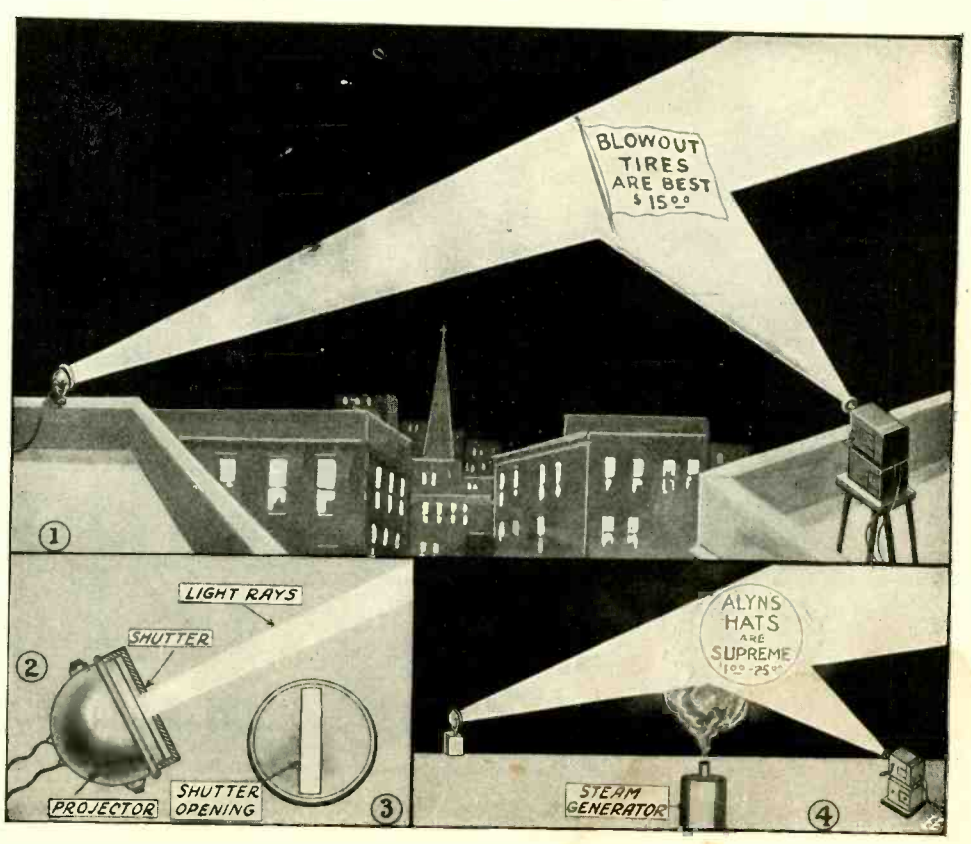
produce the weird and unusual effect of *black people* moving in a *black world,* they are most suitable for comic pictures.

A New Way to Make Silhouette Movies. The Man in the Pictures Shown Is Photographed as in Fig. 1 from Life, While the Giant Bird and the Elephant Are Drawn by an Artist in the Proper Scale and then Photographed. Figs. 2 and 5 Show the Combined Effects Clearly.

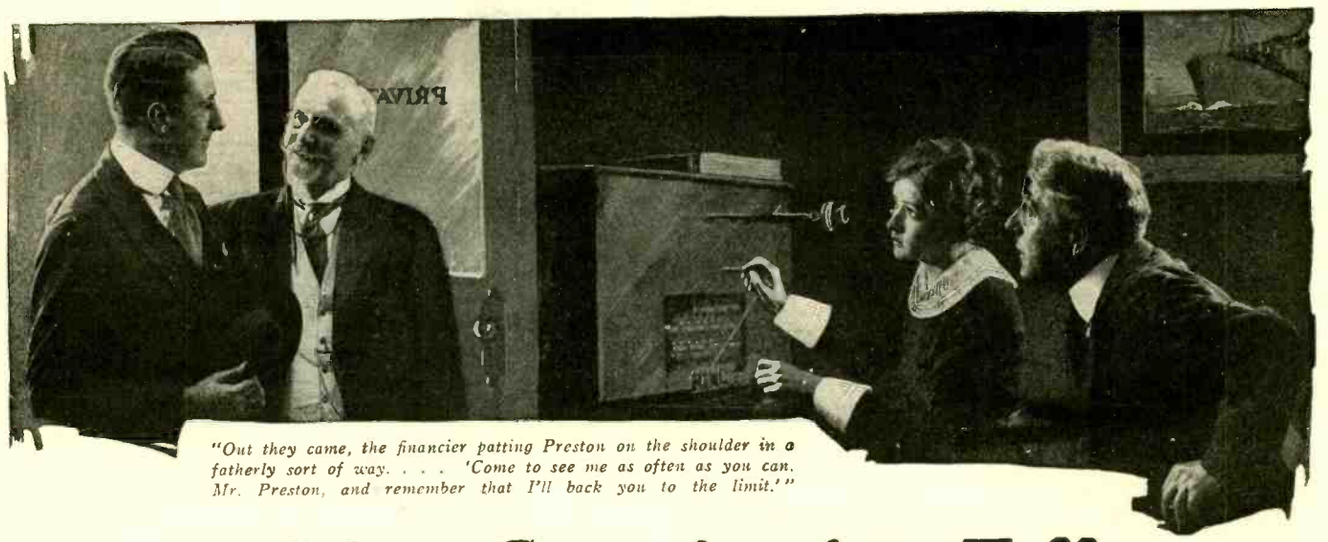
Silhouettes could be produced by shadows thrown on a light screen. Shadows, however, do not produce a sufficiently sharp image. Gilbert's method consists rather of directly photographing the actors. They present the appearance of silhouettes by having their movements performed in front of a powerfully illaminated screen. The method used is shown in figure 1. Here we have a stage upon which actors are moving before the transparent screen, behind which lights are arranged to give the necessary illumination, but without throwing direct light rays thru the screen.

The screen forms the front of a box or small chamber in which the light is produced, but projected from the white painted walls to the screen. The side wings of this box carry banks of powerful electric lights which brilliantly illuminate the rear side of the transparent screen. The arrangement is such as to prevent shadows from falling from actors upon the screen. Their position is indicated in figure 1. If the lights are of sufficient intensity, pictures taken by means of a motion-picture camera in front of the stage, as shown in figure 1, will be in silhouette. This method of producing the pictures presents the advantage of giving the actors entire freedom of movement, without reference to the illuminating arrangement.

Gilbert's method admits of various interesting applications, by which novel effects can be produced. Figure 2, for instance, shows the picture of a tremendous bird eating a man. The actions of the man have been actually picturized (to use the language of the "movie" industry), as shown in figure 3, in a separate film. The bird, however, and his "cruel" actions have been produced by the pen of an artist according to figure 4. Then both films have been combined into the final working film, figure 2, with its weird impressions. In a similar way films, figure 5, of an elephant and his trainer have been composed by combining figures 6 and 7. The trainer has here been an actual man, but the elephant, no matter how natural he may look, has been originated by an artist. In this case it is decidedly more economical to arrive at the elephant's picture by employing the skill of an artist than by having an actual elephant on the stage.



The background of the picture, consisting let us say of buildings, is frequently produced by having a permanent drawing painted on the screen before which the actors appear. A picture of this kind is illustrated in figure 1. In this case it is not necessary to combine two films into one, which naturally adds to the production expenses. It is often possible, however, to make the background a natural picture, such as a street scene, and this can then be combined with a comic silhouette picture produced by means of the Gilbert process.



An Electric Sign in Mid-Air

The accompanying illustration shows a recent invention of Mr. Frank H. Ellison, of New York City, who proposes an advertising scheme susceptible to many advertising adaptations whereby two powerful beams of electric light are flashed into space at right angles, causing thereby an image in the form of an advertisement, flag, etc., to be cast up at the juncture of the two beams. The main shaft of light may be thrown from a powerful electric searchlight projector, or other source of intense illumination, while the crosswise beam

The Accompanying Illustration Shows a New Invention, Which Is as Radical as It Is Novel in Its Conception. The Inventor Proposes to Throw an Image of a Flag or an Advertisement in Mid-Air at the Interception of Two Powerful Beams of Light, as Here Illustrated.

projector, carrying the image, may be in the form of a stereopticon, in which different slides can be placed and quickly changed, as desired. In the event that an atmosphere containing water vapor, as in the East, is not available it becomes possible to provide an artificial medium for the purpose, by employing a small steam generator or boiler under the spot where the image is desired. A single steampipe or two may be run a considerable distance above the roof of a high building in the vicinity, and when it is desired to throw the image or script in the air, the steam is turned on and thus forms a very good medium for the purpose.

"Out they came, the financier patting Preston on the shoulder in a fatherly sort of way. . . . 'Come to see me as often as you can, Mr. Preston, and remember that I'll back you to the limit.'"

The Most Convincing Talker I Ever Met

Everywhere this man goes, people shower him with favors and seek his friendship. Things which other people ask for and are refused, he gets instantly. How he does it is told in this amazing story.

LET me ask you this: There is a big business deal to be put through. It involves millions of dollars. Putting it through depends wholly on one thing—getting the backing of a great financier.

But this man is bitterly opposed to your idea and to your associates. Seven of the most able men and women in all America have tried to win over this financier. They failed dismally and completely.

Now, could you, a total stranger to this man, walk in on him unannounced, talk for less than an hour, and then have him take your arm as a token of friendship, and give you a signed letter agreeing to back you to the limit?

Could you?

ASTOUNDING? Yes! But it *WAS* done. And I'll tell you how. Here is the way it all came about. For a long time the directors of our company had felt the handicap of limited capital. We had business in sight running into a million dollars a month. But we couldn't finance this volume of sales. We simply had to get big backing, and that was all there was to it.

Because of trade affiliations, one man—a great financier in New York—controlled the situation. Win him over and the rest was easy. But how to win him?—that was the question. No less than five men and two women—all people of influence and reputation—had tried. They were all repulsed—turned down cold and flat.

You know how a thing of this sort grows on you and how bitter utter defeat is. Well, we were talking it over at a board meeting when one of our directors announced that he knew of only one man who could possibly put through the deal—a man by the name of Preston.

So it was agreed that Preston was to be sounded out at luncheon the following day. He proved to be a fine type of American. At 34 years of age he had become president and majority stockholder of a thriving manufacturing business rated at three-quarters of a million dollars.

Preston was deeply interested, as anyone would be over the prospect of closing such a big deal. The director in question said casually, "Why don't you run down to New York and take a shot at it, Preston?" Preston looked out of the window for a moment, and then quietly answered, "You're on."

I WENT along with Preston simply as a matter of form to represent our interests. Aboard the 10:25 train out of Chicago we headed for the smoker and got to talking with the crowd there.

Then I noticed something. Preston had dominated them all. Everyone was eagerly hanging on his words, and looking at him with open admiration. No sooner would he stop talking than one of the men would start him up again. And as the men dropped off at stations along the way they gave Preston their cards, with pressing invitations to look them up. No doubt about it, Preston was *THE* man aboard that car.

The colored porter, too, came under his sway. For that night, when the berths were being made up, the porter came unasked to Preston, told him that his berth was right over the car trucks, and insisted upon changing it to a more comfortable one.

And so it went all the way to New York. Everyone who met Preston took a great liking to him the instant he spoke. They seemed to be eager for his companionship—wanted to be with him every minute, openly admired him, and loaded him with favors.

Even the usual haughty room clerk at the hotel showed a great interest in Preston's welfare. He showered us with attention while a long line of people waited to register.

The next morning we called on the great financier—the man who was so bitterly against us and had flatly turned down seven of our shrewd influential representatives.

I waited in the reception room—nervous, restless, with pins and needles running up and down my spine. Surely Preston would meet the same humiliating fate?

But no! In less than an hour out they came, arm in arm, the financier patting Preston on the shoulder in a fatherly sort of way. And then I heard the surprising words, "Come to see me as often as you can, Mr. Preston, *and remember that I'll back you to the limit!*"

AT the hotel that night sleep wouldn't come. I couldn't get the amazing Preston out of my thoughts. What an irresistible power over men's minds he had. Didn't even have to ask for what he wanted! People actually competed for his attention, anticipated his wishes and eagerly met them. What a man! What power! . . . Then the tremendous possibilities of it all—think what could be done with such power!

What was the secret? For secret there must be. So the first thing next morning I hurried to Preston's room, told him my thoughts, and asked him the secret of his power.

Preston laughed good-naturedly. "Nothing to it—I—well—that—is—" he stalled. "I don't like to talk about myself, but I've simply mastered the knack of talking convincingly, that's all."

"But how did you get the knack?" I persisted.

Preston smiled, and said, "Well, there's an organization in New York that tells you exactly how to do it. *It's amazing!* There's really nothing to study. It's mostly a knack which they tell you. You can learn this knack in a few hours. And in less than a week it will produce definite results in your daily work.

"Write to this organization—The Independent Corporation—and get their method. They send it on free trial. I'll wager that in a few weeks from now you'll have a power over men which you never thought possible . . . but write and see for yourself." And that was all I could get out of the amazing Preston.

WHEN I returned home I sent for the method Preston told me about. It opened my eyes and astounded me. Just how he had won over the financier was now as clear as day to me. I began to apply the method to my daily work, and soon I was able to wield the same remarkable power over men and women that Preston had. I don't like to talk about my personal achievements any more than Preston does, but I'll say this:

When you have acquired the knack of talking convincingly, it's easy to get people to do anything you want them to do. That's how Preston impressed those people on the train—how he got special attention from the hotel clerk—how he won over the financier—simply by talking convincingly.

This knack of talking convincingly will do wonders for any man or woman. Most people are afraid to express their thoughts; they know the humiliation of talking to people and of being ignored with a casual nod or a "yes" or "no." But when you can talk convincingly, it's different. *When you talk people listen and listen eagerly.* You can get people to do almost anything you want them to do. And the beauty of it all is that they think they are doing it of their own free will.

In committee meetings, or in a crowd of any sort you can rivet the attention of all when you talk. You can force them to accept your ideas. It helps wonderfully in writing business letters — enables you to write sales letters that amaze everyone by the big orders they pull in.

Master Electricity By Actual Practice

The only way you can become an expert is by doing the very work under competent instructors, which you will be called upon to do later on. In other words, *learn by doing.* That is the method of the New York Electrical School.

Five minutes of actual practice properly directed is worth more to a man than years and years of book study. Indeed, Actual Practice is the only training of value, and graduates of New York Electrical School have proved themselves to be the only men that are fully qualified to satisfy EVERY demand of the Electrical Profession.

The Only Institution of the Kind in America

At this "Learn by Doing" School a man acquires the art of Electrical Drafting; the best business method and experience in Electrical Contracting, together with the skill to install, operate and maintain all systems for producing, transmitting and using electricity. A school for Old and Young. Individual instruction.

Over 5,500 Graduates are Successful Men in the Electrical World

No previous knowledge of electricity, mechanics or mathematics is necessary to take this electrical course. You can begin the course now and by steady application prepare yourself in a short time. You will be taught by practical electrical experts with actual apparatus, under actual conditions.

Special Automobile Ignition Course

We have just installed a special automobile ignition course for auto mechanics, garage men and owners. The course covers completely ignition, starting, lighting and other electrical equipment in connection with automobiles, motor boats, etc.

Let us explain our complete courses to you in person. If you can't call, send now for 64-page book—it's FREE to you.

New York Electrical School

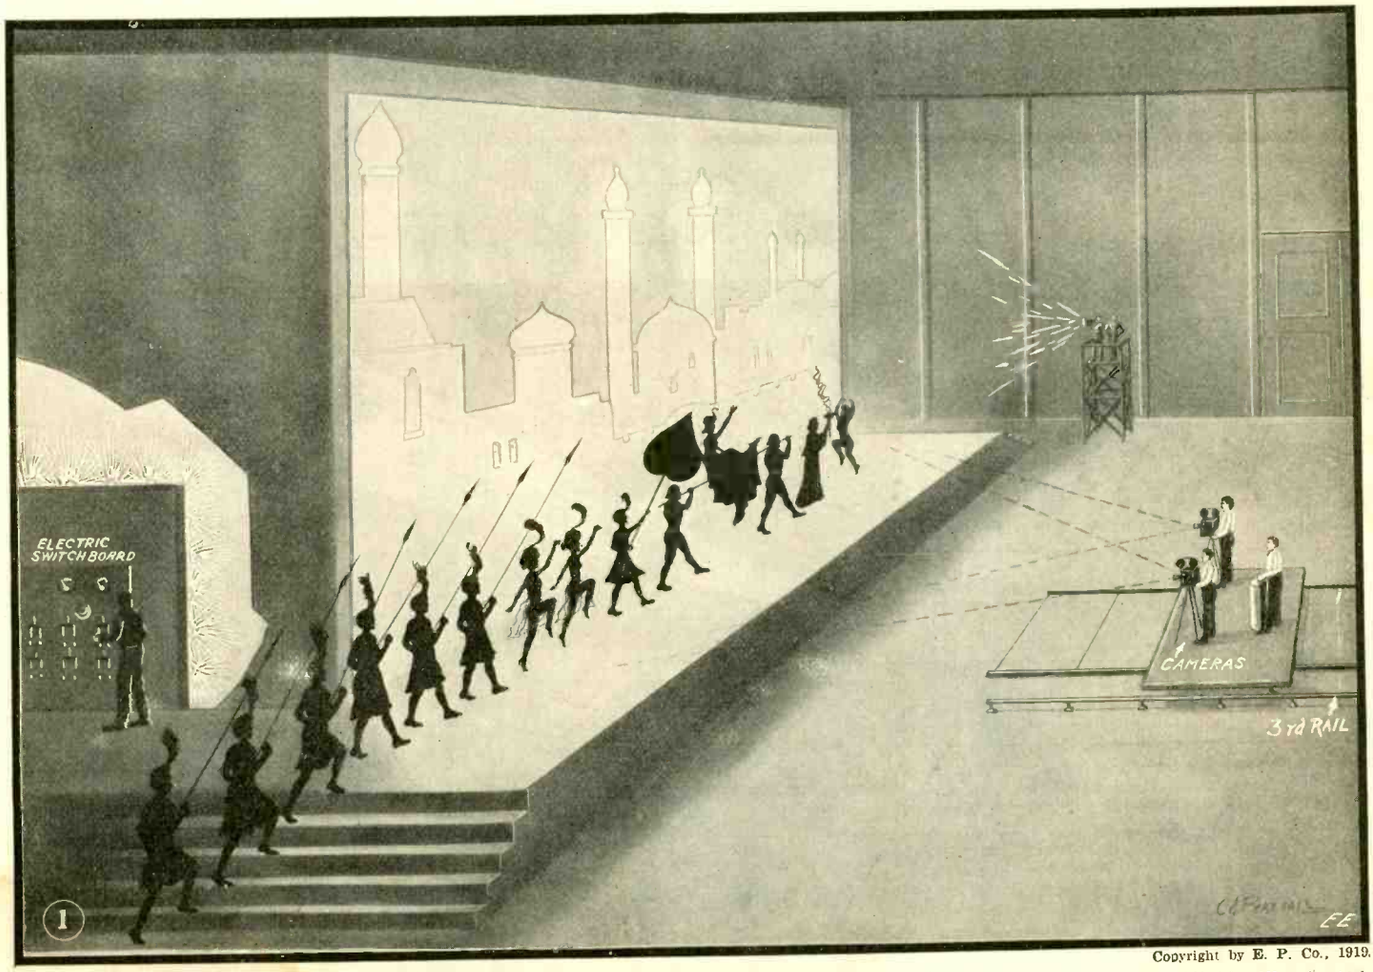
Silhouette Movies

By H. GUMPEL

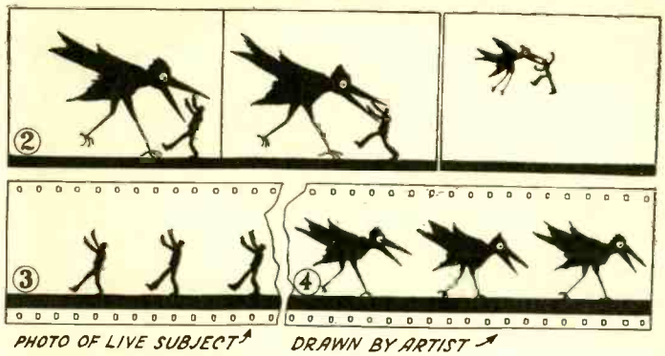


PROGRESSIVENESS, combined with resourcefulness and inventive ingenuity, are counting for much to-day in the production of live motion-picture films. The public wants to be entertained during their leisure hours. Something radically new has to take the place of the old, constantly, to suit the "movie" fans and keep the theaters filled. The greatest attractions of to-day will lose their interest and novelty to-morrow. It

Mechanical Production of Moving Picture Films in "Silhouette"

is therefore self-evident that in this atmosphere of changeability there is a great field open for wide-awake inventors.

The latest novelty in the film world is the photographic production of *silhouette pictures* recently patented by C. A. Gilbert. Pictures of this kind until recently had to be drawn by hand. From fifteen to eighteen individual pictures illustrating the progress in action are needed per second. The individually drawn comic picture is therefore expensive in manufacture.



Gilbert is using silhouettes. Since these

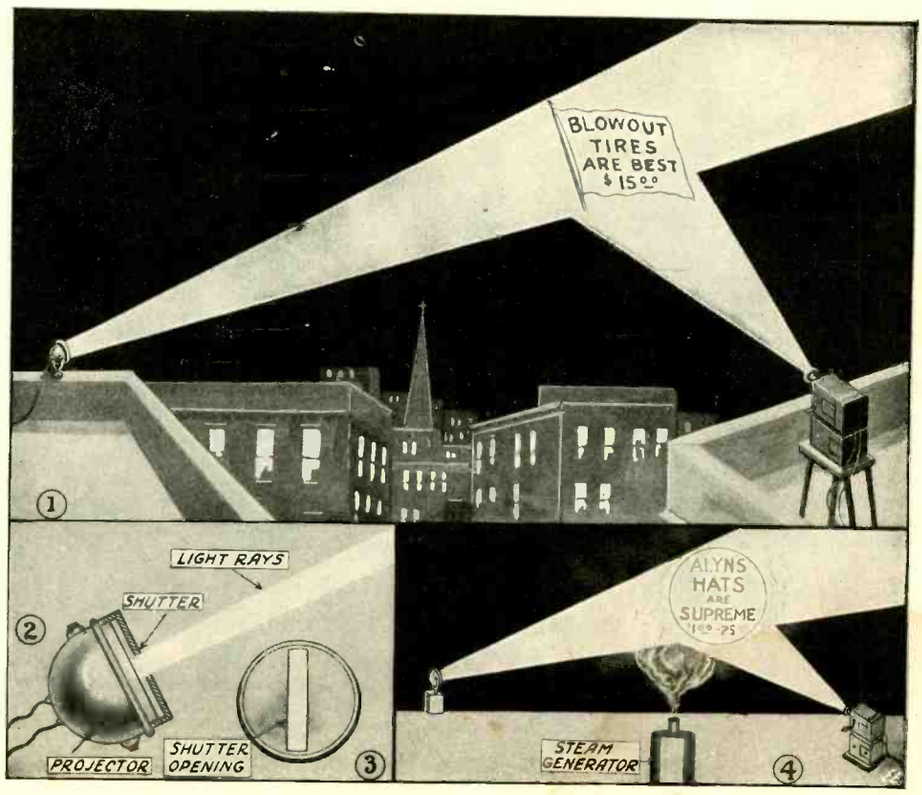
produce the weird and unusual effect of *black people* moving in a *black world*, they are most suitable for comic pictures.

A New Way to Make Silhouette Movies. The Man in the Pictures Shown Is Photographed as in Fig. 1 from Life, While the Giant Bird and the Elephant Are Drawn by an Artist in the Proper Scale and then Photographed. Figs. 2 and 5 Show the Combined Effects Clearly.

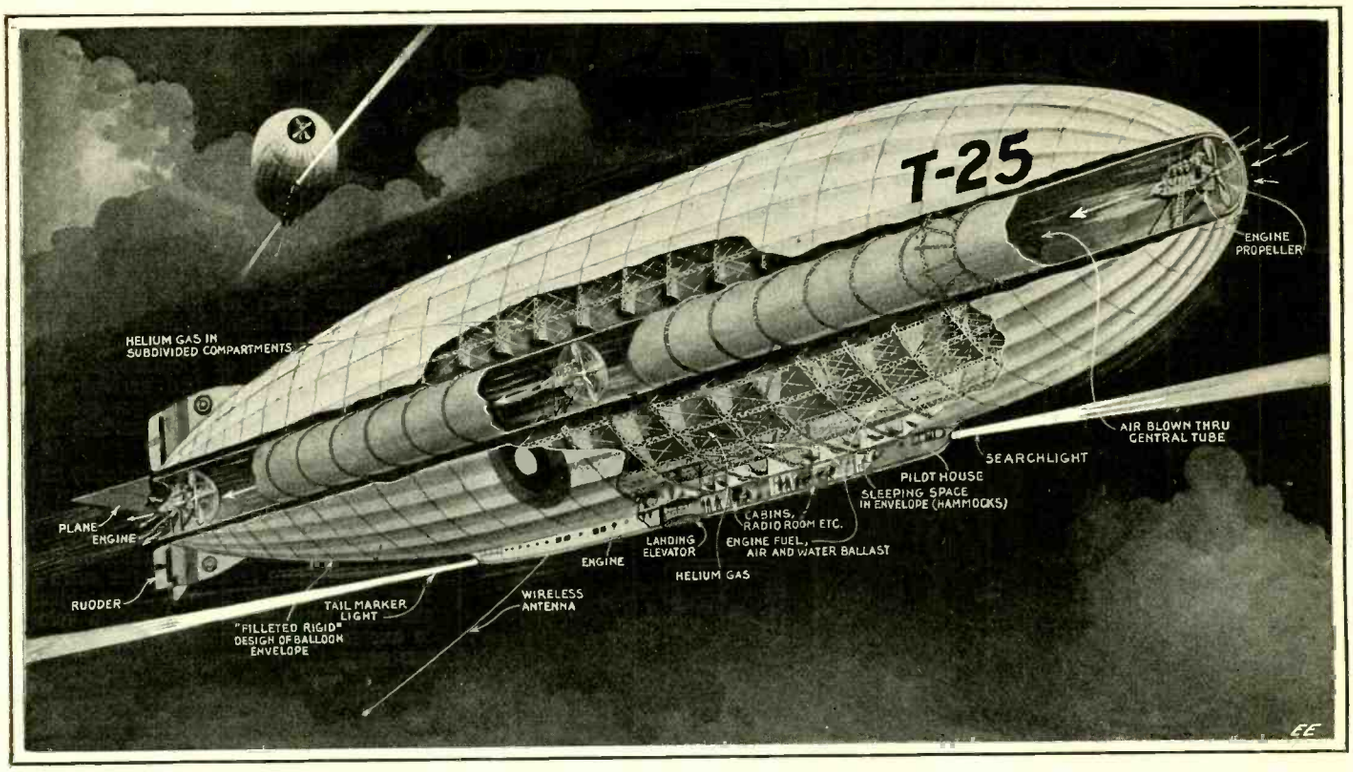
Silhouettes could be produced by shadows thrown on a light screen. Shadows, however, do not produce a sufficiently sharp image. Gilbert's method consists rather of directly photographing the actors. They present the appearance of silhouettes by having their movements performed in front of a powerfully illuminated screen. The method used is shown in figure 1. Here we have a stage upon which actors are moving before the transparent screen, behind which lights are arranged to give the necessary illumination, but without throwing direct light rays thru the screen.

The screen forms the front of a box or small chamber in which the light is produced, but projected from the white painted walls to the screen. The side wings of this box carry banks of powerful electric lights which brilliantly illuminate the rear side of the transparent screen. The arrangement is such as to prevent shadows from falling from actors upon the screen. Their position is indicated in figure 1. If the lights are of sufficient intensity, pictures taken by means of a motion-picture camera in front of the stage, as shown in figure 1, will be in silhouette. This method of producing the pictures presents the advantage of giving the actors entire freedom of movement, without reference to the illuminating arrangement.

Gilbert's method admits of various interesting applications, by which novel effects can be produced. Figure 2, for instance, shows the picture of a tremendous bird eating a man. The actions of the man have been actually picturized (to use the language of the "movie" industry), as shown in figure 3, in a separate film. The bird, however, and his "cruel" actions have been produced by the pen of an artist according to figure 4. Then both films have been combined into the final working film, figure 2, with its weird impressions. In a similar way films, figure 5, of an elephant and his trainer have been composed by combining figures 6 and 7. The trainer has here been an actual man, but the elephant, no matter how natural he may look, has been originated by an artist. In this case it is decidedly more economical to arrive at the elephant's picture by employing the skill of an artist than by having an actual elephant on the stage.



The background of the picture, consisting let us say of buildings, is frequently produced by having a permanent drawing painted on the screen before which the actors appear. A picture of this kind is illustrated in figure 1. In this case it is not necessary to combine two films into one, which naturally adds to the production expenses. It is often possible, however, to make the background a natural picture, such as a street scene, and this can then be combined with a comic silhouette picture produced by means of the Gilbert process.



An Electric Sign in Mid-Air

The accompanying illustration shows a recent invention of Mr. Frank H. Ellison, of New York City, who proposes an advertising scheme susceptible to many advertising adaptations whereby two powerful beams of electric light are flashed into space at right angles, causing thereby an image in the form of an advertisement, flag, etc., to be cast up at the juncture of the two beams. The main shaft of light may be thrown from a powerful electric searchlight projector, or other source of intense illumination, while the crosswise beam

The Accompanying Illustration Shows a New Invention, Which Is as Radical as It Is Novel in Its Conception. The Inventor Proposes to Throw an Image of a Flag or an Advertisement in Mid-Air at the Interception of Two Powerful Beams of Light, as Here Illustrated.

projector, carrying the image, may be in the form of a stereopticon, in which different slides can be placed and quickly changed, as desired. In the event that an atmosphere containing water vapor, as in the East, is not available it becomes possible to provide an artificial medium for the purpose, by employing a small steam generator or boiler under the spot where the image is desired. A single steampipe or two may be run a considerable distance above the roof of a high building in the vicinity, and when it is desired to throw the image or script in the air, the steam is turned on and thus forms a very good medium for the purpose.

This Illustration Shows a Recent Development In Simplifying the Airship and at the Same Time Making for More Efficiency all Around. The Idea Is To Do Away Entirely With the Underslung Power Gondolas, Such as are Used on the English and German Airships of the Zeppelin Type. The Engines are Housed in a Wind Tunnel Running Thru the Center of the Airship as Shown. Propellers Which are from Fifteen to Twenty Feet in Diameter Create a Sort of Vacuum Within the Tube, and the Airship Therefore will Virtually Suck Its Way Thru the Air at an Increased Speed.

Speeding Up the Airship

By H. GERNSBACK

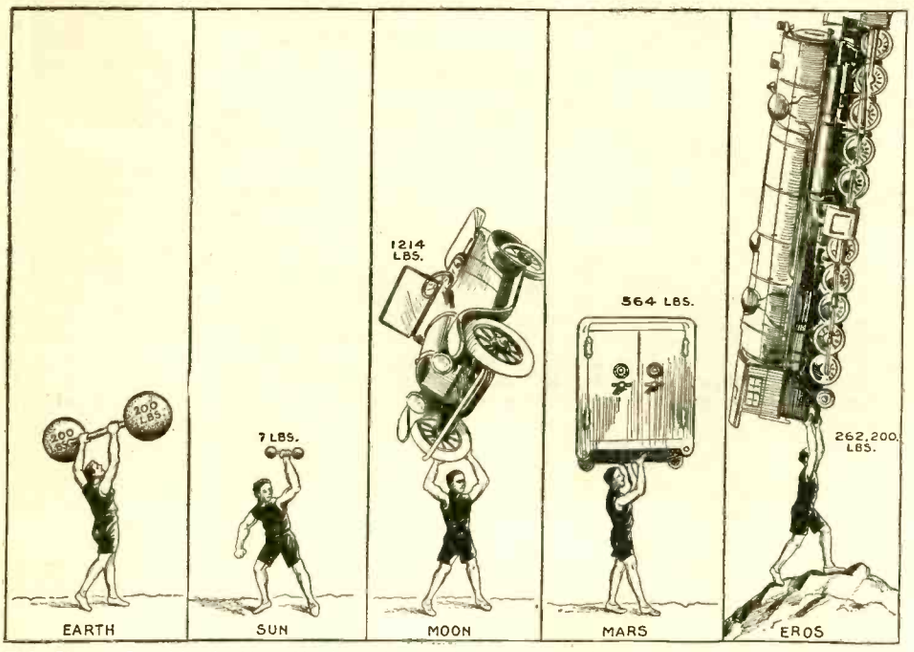
ON its historic cruise to the United States the R-34, while making a splendid achievement, disappointed many for the reason that it had been hoped that the dirigible would make a westerly passage much quicker than it actually did. Of course, the airship had to battle against head-winds nearly all the way over, which is best proven by the fact that on its return trip it accomplisht the eastward passage in 75 hours.

One reason, and the entire reason, that Brown and Alcock flew across the ocean in sixteen hours with an airplane, while the quickest trip of the airship took over four times as long, is explained in one word—friction. The airplane offers but little surface to the wind, due to the fact that its surfaces not only are comparatively small, but cutting like a knife, they do not offer much resistance to the air. The airship on the other hand, due to its large and cumbersome bulk, gives rise to enormous friction not only head on, but along its sides as well. In this capacity it stands on a par with the big ocean liner that sinks deep into the water, and consequently needs an enormous power to move it, whereas the little motorboat-hydroplane, when provided with suitable vanes, will actually skim above the water, hardly touching the latter, at a speed many times that of the ocean liner. Here we have the same comparison. It is simply a matter of reduced friction of the mechanical birds and their natural element, the air. We therefore find that if we can do away with all unnecessary friction on the huge airship, we will be able to propel it much faster. Take the case of the R-34 with its four gondolas; these take up quite a good deal of room and make for air resistance when the airship is in flight. While to the layman this appears trifling, it tends to retard the total speed of the airship very considerably, and if we can do away with these gondolas and their engines, we will increase the speed of the airship by just so much.

Also, if we can diminish the resistance created by the nose of the airship as it plows its way thru the air, we will again increase its speed. This, of course, is apparent, and the following experiment, which anyone may try himself, ought to prove it abundantly. Take a pail of water and try to drag it with the open side thru a stream of water. You will meet with an enormous resistance. Take the same pail and make a hole of about half the diameter in the bottom of the pail. You will now find that you can drag the pail with considerable ease, for the reason that the water flows right thru it. In the former experiment it was necessary to first fill the pail with water, and after this move (displace) a column of water represented by the diameter of the pail.

With these things in view, the writer offers a novel idea in which it is proposed to speed up dirigibles considerably. The idea is made clear in the accompanying illustration. It will be seen that this airship has no gondolas whatsoever, and the power plant is not hung underneath the airship, as is common in all Zeppelin types. Instead, the center of the airship is hollow, forming a wind tunnel extending clear thru the entire length of the airship. This air tube, of course, is not a small affair, but is anywhere from 15 to 25 feet in diameter, as will be noted. The three engines are stationed, the first at the nose, the second at the tail end, and the third in the center of the wind tunnel. The propellers must be of the same diameter as that of the tunnel, and the object is to have all three of them working at the same time in order to suck in the air at the nose of the ship and form a sort of vacuum. The air will then flow thru the tunnel, the same as the water flows thru the pail after we made a central opening in its bottom. From this it will be seen that the airship will *virtually suck its way thru the air*, and it should be possible for such a craft to make much greater speed than with the former methods. Moreover, as the engines are not exposed to the elements, it would also seem that not so much engine trouble should develop, as is the case with the under-slung type. Another very important consideration is that inasmuch as the air is rushing right back of the engines, the cooling of the latter is infinitely better than at present. And as every engine man knows, the better an engine is cooled the less likelihood there is of trouble developing.

In the aërial liner of the future, in order to do away with all unnecessary head resistance, the crew's quarters, etc., will probably be located at the bottom of the airship, and as will be noted in the illustration, the entire living quarters are fashioned with stream lines, to minimize all unnecessary air resistance.



Hydrogen gas will probably not be used much longer, as already Zeppelin types in Germany demonstrated that these huge bags are not safe with the enormous quantities of inflammable gas stored within their metallic girders. Electric sparks set up by the electrical machinery of wireless apparatus are a constant danger to the explosive gas, and the same is true should lightning hit the dirigible. The airship of the future for this reason will use Helium gas in its subdivided compartments, or some other

Interesting Phenomena of Gravitation

This Shows Graphically How Much a Human Being Would Be Able to Lift on the Various Heavenly Bodies. This Illustrates That a Pound Does Not Weigh a Pound Everywhere in the Universe, But Changes According to the Mass and Density of the Heavenly Body upon Which It Is Placed.

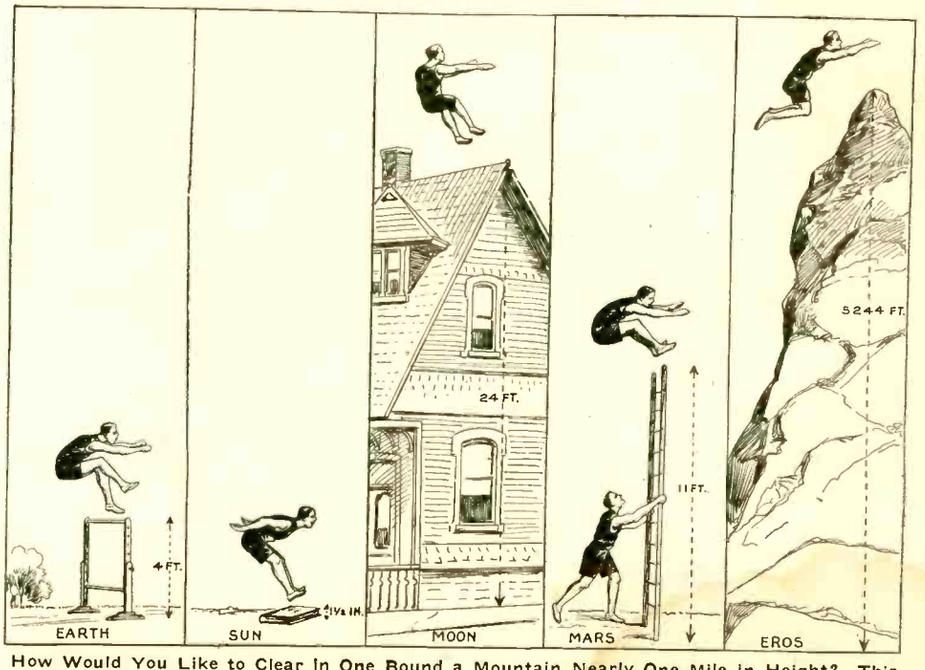
THE earth is revolving around the sun in an orbit that is almost a perfect circle with a velocity of *eighteen and one-half miles per second.* If for any reason this orbital velocity should suddenly cease or be brought to *zero,* the earth would fall into the sun and the time of falling would be sixty-four and one-half days. If its orbital velocity should be brought *almost* to zero, that is if the earth still possest a slight motion at right angles to the line connecting it with the sun, it would describe an extremely narrow ellipse with the sun at the further focus (see diagram 1), and would return to the point where its velocity had changed after one hundred and twenty-nine days.

If the orbital velocity should be increased more and more, the ellipse would become wider and wider, and the period of the earth's revolution longer and longer. When the orbital velocity reached eighteen and one-half miles per second the earth would be revolving around the sun in a circular orbit in a period of 365¼ days (as it does now). If the orbital velocity should increase still more the earth's orbit would become elliptical again with the sun now at the nearer focus and the width of the ellipse would increase as the velocity increased.

THE EARTH COULD LEAVE SOLAR SYSTEM.

When the orbital velocity reached 26.2 miles per second (the velocity from infinity or parabolic velocity for the earth), the earth would escape the control of the sun and leave the solar system on the curve of a parabola never to return. If the orbital velocity should exceed 26.2 miles per second the earth would also escape from the solar system, but the curve would be hyperbolic instead of parabolic in form.

Now each planet in the solar system has its parabolic velocity or, as we might call it, velocity of escape from the solar system, and as this varies inversely as the square root of the planet's distance from the sun, it becomes less and less as the planet's distance from the sun increases.



For Neptune the parabolic velocity is only 4.7 miles per second. If its orbital velocity of three and one-third miles per second should be increased to this parabolic velocity Neptune would escape from the solar system.

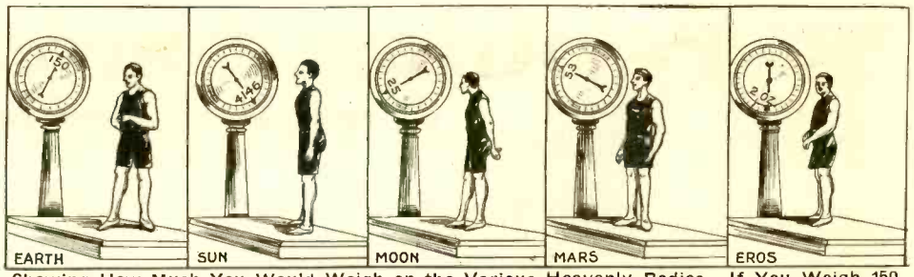
If a body should fall from infinity or the distance of the stars toward the sun under the force of the sun's attraction *alone,* it would have acquired a velocity of 4.7 miles per second by the time it had reached the orbit of Neptune, 26.2 miles per second when it had arrived at the earth's orbit and 383 miles per second by the time it had reached the surface of the sun.

Let us consider now what velocity an object at the surface of the sun must possess in order to escape the sun's attraction and pass off into space. Evidently this would be the same as the parabolic velocity or velocity from infinity for the sun's surface, 383 *miles per second.* Any object at the solar surface endowed with a velocity in excess of this amount would leave the sun never to return.

THROWING A STONE INTO INFINITY.

Since it can be shown that this velocity of escape varies directly as the square root of the mass of the attracting body, it is possible to compute the velocity of escape for objects on all of the planets in the solar system as well as for objects on the sun. These values are given in Table I. Objects on any of the planets possessing these velocities or greater velocities escape from the control of their respective planets and either become satellites of the sun or leave the solar system entirely, depending on the excess of their velocities over the critical value. It will be noted from a glance at these critical velocities given in Table I that it would be easily possible to fire a cannon ball from Ceres, the largest asteroid, that would pass off into space, never touching the surface of the asteroid, while on Eros a stone could be thrown from the hand with sufficient velocity to enable it to escape the control of the asteroid.

How Would You Like to Clear In One Bound a Mountain Nearly One Mile In Height? This Is Exactly What You Could Do If You Were on Eros, the Small Asteroid. If You Could Jump Four Feet High on Earth, You Could Jump Over One Mile on Eros. Even on the Moon You Could Jump Over a House Without Much Trouble, with One Bound.

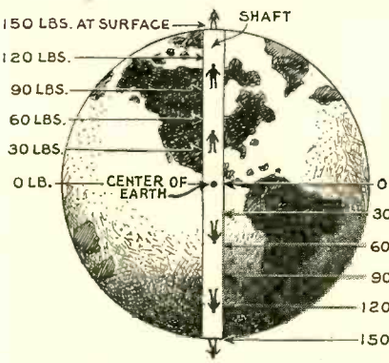


SHOOT A CANNON BALL FIVE MILES A SECOND AND YOU HAVE A NEW MOON.

In the last column in Table I is given the velocities for satellites grazing the surfaces of the various planets, the sun or moon, in circular orbits. It can be shown that these values are equal to the critical velocities or velocities of escape multiplied by the square root of one-half. It will be noted that for the sun this value is 271 *miles per second,* that is, an object hurled from the sun with a velocity of 271 miles per second would become a satellite of the sun, moving close to its surface in a circular orbit. An object hurled from the earth's surface with a velocity of 5 miles per second would likewise become a satellite of the earth, revolving around it in a circular orbit close to the surface.

It is interesting to consider in this connection what would be the course of projectiles hurled from the earth or other planets with varying velocities.

If an object should be thrown from a mountain or some other elevated position on the earth's surface *horizontally* (neglecting resistance of air) with a very slight initial velocity, it would fall almost straight downward, and if the earth were concentrated at a point at its center the object would move in a very narrow ellipse around the earth's center, returning to the point of departure again after 30 minutes. If the velocity is increased more and more the object falls further and further to one side, and if the earth were concentrated at its surface so the object would not encounter the surface; it would move in an elliptical path, always returning to the original point. The widths of the ellipse would increase with the velocity (see diagram II). Finally when the velocity with which the object is hurled reaches 5 miles per second it leaves the earth entirely and becomes a satellite of the earth, moving in a circular orbit with a period of 1 hour 25 minutes. If the velocity is increased beyond 5 miles per second the object continues to revolve around the earth in an elliptical orbit whose width increases with the velocity until a velocity of 7 miles per second is reached, when the object flies off on a parabolic curve, escaping the earth's attraction entirely and becoming a satellite of the sun. The same principle holds for all the other members of the solar system as well as for the earth, and a reference to table I will show the velocity of escape for each member of the solar system as well as the velocity with which an object must be thrown from the surface in order to make it a satellite of the planet in question.



It is interesting to consider in this connection what would happen if the earth should suddenly explode. All particles that received an initial velocity *under seven miles per second,* the velocity of escape, would come back to the scene of the catastrophe *repeatedly* in elliptical orbits, and those that were ejected with *equal velocities* would come back *at the same time,* however different the directions of their ejection or the width of their orbits. If the velocity of ejection equaled or exceeded seven miles per second, they would not return.

Showing How Much You Would Weigh on the Various Heavenly Bodies. If You Weigh 150 Pounds on Earth, Your Weight Would Shrink to 2 Ounces on Eros. While on the Sun You Would Weigh over 2 Tons and You Would Not Have Sufficient Strength to Lift Your Own Body.

WEIGHT ON OTHER PLANETS.

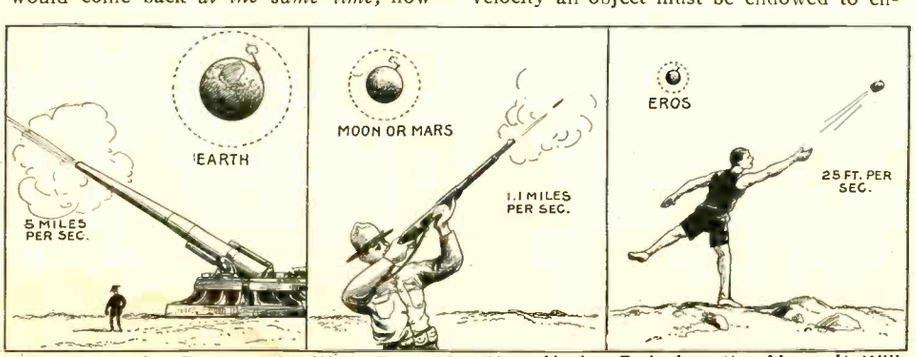
Let us consider now some of the interesting phenomena arising from the fact that the surface gravity of a planet, or its attraction for objects at its surface, is proportional to its mass or the quantity of matter that it contains. This affects directly the weight of objects at the surfaces of the planets and the amount of work that can be performed against the attraction of gravity on the various planets.

Do You Know That if There Were a Shaft Drilled Right thru the Earth, and if You Were to Descend into Same, You Would Weigh Nothing When You Arrived at the Center? Our Illustration Shows How Much You Would Weigh at the Different Levels in the Shaft.

Taking the earth's attraction for objects at its surface as the unit, the relative surface gravity for all other planets, the sun, and the moon, has been computed (see Table I) by multiplying the density by the radius, both quantities relative to the corresponding values for the earth.

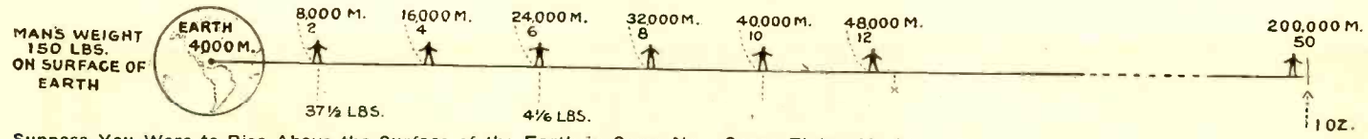
We then find what a man weighing 150 lbs. on the earth would weigh if it were possible for him to exist on the sun, moon or other planets, to what height he could jump against the attraction of gravity and what weights he could lift; also with what velocity an object must be endowed to enable it to escape from the planet and under what condition it would become a satellite of the planet revolving close to its surface in a circular orbit.

We note (Table I) that a man who weighs 150 lbs. on the earth would weigh 4,146 lbs., or over *two tons,* on the sun. If he could jump to a height of four feet on the earth he would find himself unable to raise his body even two inches by his own energy, against the sun's surface gravity. He would be, indeed, crushed by his own weight, lifting his arms and feet and moving about only with the greatest effort. He would have as much difficulty in lifting a weight of seven pounds on the sun as in lifting a weight of two hundred pounds on the earth.



On the asteroid Eros on the contrary his weight would be but *two ounces.* He could jump to the height of a mile as easily as he could jump to a height of four feet on the earth, and he could lift *one hundred and thirty tons* as easily as he would lift two hundred pounds on the earth.

It will be noted that the weight of the large engine on the cover drawing is given as 684,000 pounds. This corresponds to a weight of 500 lbs. on Earth. This is probably the limit a professional strong man could lift on earth.



LIVING IN A VACUUM.

This brings us to the interesting subject as to what would happen if we were to visit one of our small planetary bodies on which there is no atmosphere, such as for instance our moon and any of the Asteroids. Being that the gravitational pull is so small on these bodies, the atmosphere—if they had any—probably escaped aeons ago. Consequently, if we were to visit any of these heavenly bodies, we would be placed in an absolute vacuum much greater than we can procure with our best vacuum pumps on earth. How, then, could we walk on such a body and exist? We must always remember that every square inch of our body on earth is weighed down with an atmospheric pressure of 14.7 pounds. The total pressure upon the human body is therefore enormous, amounting to 47,040 lbs. Remove this pressure and our blood vessels would burst like an automobile tire.

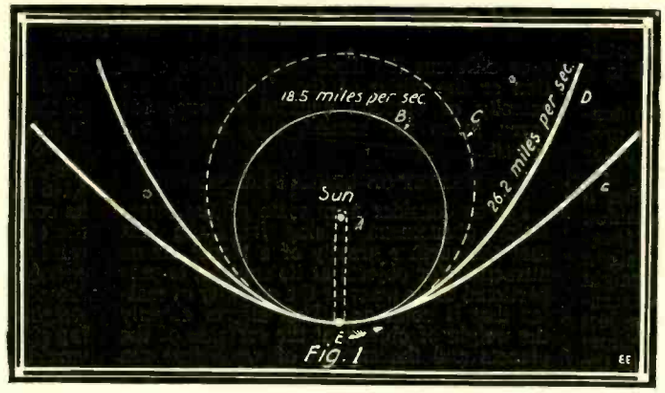
The thing to do then, if we are ever enabled to visit the moon or one of the Asteroids, would be to encase ourselves in a strong rubber fabric by having strips of thick rubber sheeting wrapt all around our body, as suggested in our cover drawing. These rubber strips would be wrapt around the body and limbs similar to what our soldiers do with their puttees. It would, of course, also be necessary that we should bring along our own air, and this, too, is suggested in our cover drawing, where a compress air tank is strapt to the back of the man, an automatic air valve regulating the air supply as it is consumed. By means of suitable chemicals the air could be renewed automatically for an indefinite time. In order that we can see about us, it would also be necessary for us to provide a sort of helmet fitted with a thick glass plate adjusted air-tight to the helmet. The whole contrivance would then be strapt to the body.

This Illustration Depicts with What Force You Must Hurl a Body Into the Air so It Will Never Return,—in Other Words, Becoming a New Satellite. If You Could Build a Cannon to Shoot a Projectile into the Air Going at the Rate of Five Miles per Second, It Would Become a New Moon Gravitating Around the Earth In an Orbit of Its Own. On Mars the Velocity Need Only Be 1.1 Miles per Second, While on Eros You Could Throw a Stone into the Air So That It Would Never Return.

Suppose You Were to Rise Above the Surface of the Earth in Some New Space-Flying Machine. This chart Shows How Much Weight You Would Lose as You Get Away from the Gravitational Attraction of the Earth.

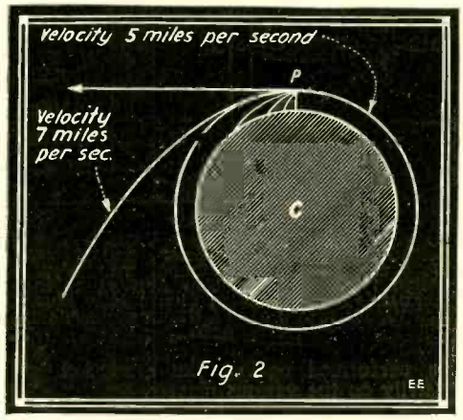
The feet as well as the hands would also have to be encased in very snug-fitting rubber, as no part of the human body should be exposed to the vacuum which would draw out the blood immediately. It is well known that when aviators ascend to a great height blood begins to flow out from underneath the finger nails, due to the reduced pressure. It can be easily imagined what will happen if all the pressure was removed and the hand was exposed to the vacuum.

His greatest difficulty, granted he were able to withstand the lack of air and atmospheric pressure, would be experienced in retaining a foothold upon this insecure mass of rock spinning thru space, for so slight is the attractive force that holds him to the surface that *it would be possible for him to jump with sufficient initial velocity to escape from the asteroid,* the velocity of escape being only thirty-six feet per second, and the height to which he is able to jump against the force of gravity being 1 mile.



Referring to Table I, we note that the surface gravity of Uranus is nearest to that of the earth and that a man who weighs 150 lbs. on the earth would weigh 149 lbs. on Uranus and would be able to do practically the same amount of work. This arises from the fact that the greatly *increased radius* of Uranus, three and eight-tenths that of the earth, is offset by its greatly *decreased density,* which is only one-quarter that of the earth, the product of the two giving the surface quantity of Uranus. This is also true in a less degree with Saturn and Neptune. The huge bulk of Jupiter, however, considerably overbalances its low density, and a man who weighs 150 lbs. on the earth would find his weight of 378 lbs. a burden to him on Jupiter.

MAN WEIGHS 53 POUNDS ON MARS.



On Mars, on the other hand, he would find he weighed only 53 lbs. and that he could jump nearly three times as high as he could on the earth and lift loads nearly three times as heavy. On the moon he would weigh only one-sixth as much as on the earth and could throw a ball six times as far and jump six times as high. He would lift six hundred pounds as readily as he would lift one hundred pounds on the earth.

Venus most closely resembles the earth among the terrestrial planets and a man would find, if he were suddenly transferred to Venus, that he would only lose twenty-two pounds in weight by the change. He could lift weights fifteen per cent heavier and jump fifteen per cent. higher than on the earth.

Let us note in passing the low velocity of escape for the moon, Mercury and Mars. This is believed to have an important bearing upon the possibility of these bodies possessing and holding atmospheres. The molecules of gases in the atmosphere are moving in all directions at high velocities. It has been computed that the molecular velocity of oxygen is 1.8 miles per second at zero centigrade, of nitrogen 2.0 miles per second, of water vapor 2.5 miles per second, of helium 5.2 miles per second and of hydrogen 7.4 miles per second. Evidently then the earth could not *permanently* hold free hydrogen in its atmosphere or the moon and Mars any of these gases. Even if Mars were originally clothed with an extensive atmosphere it is, according to the kinetic theory of gases, losing it molecule by molecule. Moreover, in inter-planetary space there must be wandering molecules of gases that have deserted the bodies in the solar system that have low velocities of escape. Of course upon even the largest asteroids there could not be any of the atmospheric gases of the earth, as the velocity of escape is so excessively low for all of these bodies.

This Illustrates What Would Happen If the Earth's Orbital Velocity, 18.5 Miles per Second, Were to Change Suddenly. A, If the Velocity Would Almost Cease. B, Present Velocity of Earth. C, Velocity Greater Than 18.5 Miles per Second. D, Velocity 26.2 Miles per Second. E, Velocity Greater Than 26.2 Miles per Second. At This Speed the Earth Leaves the Solar System Never to Return.

To Illustrate Course of Projectiles Hurled Horizontally from P, a Point on the Earth's Surface (Neglecting Friction of Air) at Different Velocities in Direction of Arrow. If Velocity Is Less Than 7 Miles per Second, Projectile Moves in Elliptical Curve Whose Width Depends Directly on Initial Velocity with Which Projectile Is Hurled. If Velocity Equals T Miles per Second, Projectile Becomes a Satellite of the Planet, and if Velocity is 7 Miles per Second or Greater, the Projectile Escapes Earth's Attraction and Goes Off Into Space.

WEIGHT INSIDE OF EARTH.

Let us consider now, in concluding, what would be the effect upon a man's weight if he should fall toward the earth's center thru a circular shaft (see diagram III), assuming that the earth's density is uniform thruout. Since surface gravity is equal to the density times the radius, his weight at the surface will be decreased as he falls toward the center proportionally directly to his *distance below the surface.* At a distance below the surface equal to one-fifth of the radius his weight will be decreased one-fifth of the value for the surface, that is a man who weighs 150 lbs. on the surface would weigh 120 lbs. one-fifth of the distance to the center or eight hundred miles below the surface. Two thousand miles below the surface or one-half the distance to the center his weight would be one-half the surface value or seventy-five pounds and *at the earth's center*

Ceres (largest asteroid)	485	.60	.0606	.036	6 "	108 "	5,406 "	1736 ft. per sec.	1228 ft. per sec.
Eros (small asteroid)	10	.60	.00126	.00076	2 oz.	5,244 feet (almost 1 mile)	262,200 " (130 tons)	36 " (*See Note*)	25 "

Note:—Objects leaving surface with velocity greater than values given here would not return.

Note:—The surface gravity is the product of the planet's density by its radius (relative to corresponding values for the earth's), that is, Col. 4 is the product of Col. 2 and Col. 3.

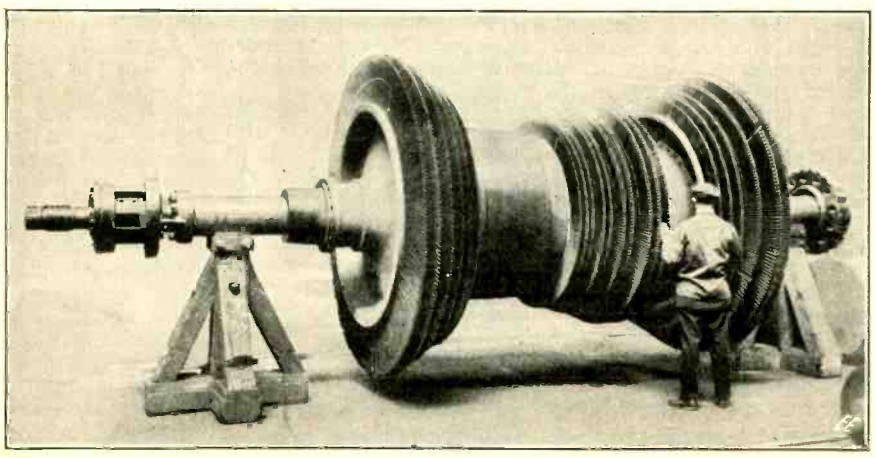
New York City Can Now Boast of the Largest Steam Turbine-Dynamo Generating Unit in the World—100,000 Throbbing Horse-Power. It Comprises a Triplex Turbo-Alternator, Occupying About One-Fourth the Space of the Old-Type Reciprocating Engine Shown at the Extreme Left of the Photo Herewith. The Comparative Size of the 100,000 H.P. Turbine Unit May Be Judged by the Man Standing Beside It—See Arrows. The Old Reciprocating Steam Engine Towered 75 feet into the Air; the New Turbine-Dynamo Stands But 20 Feet in Height. The Current Delivered Is Three Phase, 25 Cycle Frequency, at a Potential of 11,000 Volts.

World's Biggest Turbine-Dynamo--100,000 H. P.

By WILLIAM H. EASTON

TO her already long list of "greatest things in the world," New York City can now add another item, for the Interborough Rapid Transit Company has recently placed in operation at its 74th Street power house a triplex turbine-generator that is as superior to its rivals in power as the Woolworth Building is in height or the arch of the Hell Gate Bridge in length of span.

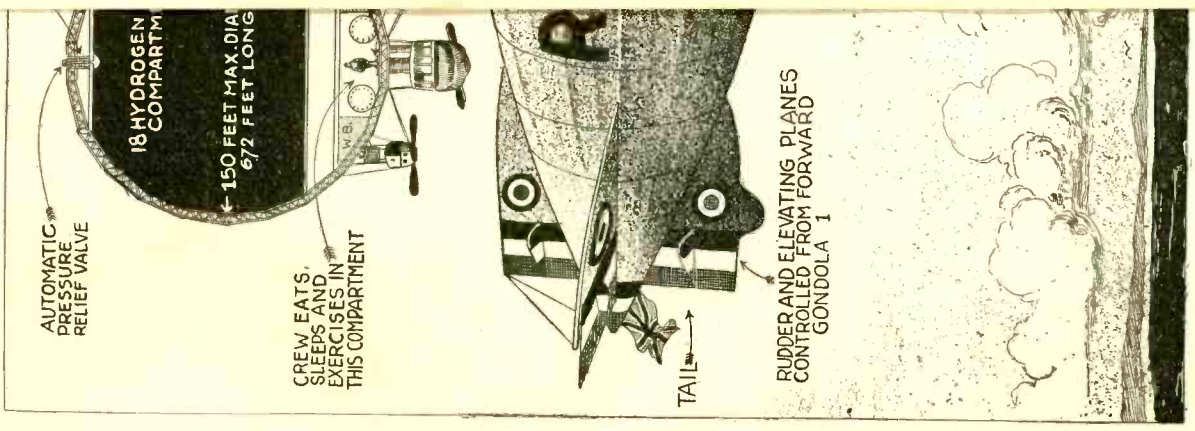
One hundred thousand horsepower is the amount of power this great engine can develop when pushed to its maximum. It is difficult to find an example that will convey an adequate impression of this figure, but the following may be of some assistance. Suppose our army now abroad, which consists of about a million men, has been landed over night and is marching up Fifth Avenue. Visualize the parades you have seen and then realize that it will take over three days and nights for this particular one, moving steadily forward in regular formation, to pass thru the Arch of Victory. Now, in a contest of strength between the turbine and all of these men taken together, the turbine would probably win.



How the Turbine Operates.

The visitor, journeying to 74th Street to see this great turbine, will probably be disappointed in its appearance. It has, indeed, a massiveness that speaks of immense power within, but in size it is dwarft by the old vertical reciprocating engine, of one-twelfth its capacity, beside which it stands; and in addition, since all its working parts are enclosed, it is entirely lacking in the fascination that visual movement imparts. But its deficiencies as a spectacle are real virtues in the eyes of the engineer, for they mean lower first cost, smaller space occupied, reduced installation and operating charges, and a high degree of reliability.

The very conspicuous difference in size between the turbine and the reciprocating engine is due to their different operating principles. The reciprocating engine consists essentially of a cylinder in which a piston is pushed up and down by the steam. The main parts of the turbine, however, are a spindle, carrying hundreds of small vanes, and a casing which encloses the spindle. The steam acting upon the vanes of the spindle revolves it as the wind turns a windmill. The motion of the turbine is, therefore, rotary and as there are no heavy parts to be stopt and started at the end of every stroke, as there are in a reciprocating engine, very high speeds are permissible, thus making it possible to develop great power from a comparatively small machine. The speed of this particular turbine is 1,500 revolutions a minute.



As has been said, the turbine is triplex; that is, it consists of one *high pressure* element and two *low pressure* elements, each connected to a separate electric generator. This gives it the appearance of three distinct machines, but it is actually a *single unit* and all three elements are started and controlled as one. The triplex arrangement is employed because it is mechanically greatly superior to the single element design for a machine of such great power. There is also the very decided additional advantage that, in an emergency, any one or two of the elements can be shut down without stopping the others. All the power eggs are, therefore, not in one basket, and the high efficiency of a single large ma-

the valves should get stuck, something might happen. They have a manometer by which they read the pressure in the hydrogen tanks Ten millimeters is dangerous. Should the valves refuse to work a fire might start and the crew be forced to land or leap for life.

EIGHTEEN HYDROGEN TANKS

The eighteen hydrogen tanks are made of goldbeaters' skin, which is the intestines of calves. The final inflation—that is, the loading of petrol and hydrogen—takes place at the minimum temperature after the sun goes down. Flying over a warm city causes expansion, and over the sea, where it is cold, the bag is caused to contract. On the way over, while flying over the ice floes around Newfoundland, there was a contraction of 40 per cent.

When the machine starts to rise and the guy ropes are thrown off, she rises until she finds her equilibrium. It may be 500 and then it may be 3,000 feet. When she finds her equilibrium, the motors start. Meanwhile the wind carries her wherever it pleases. That is the reason why in most cases a start is made between midnight and dawn.

There are eighty-one tanks on board which contain petrol, and weigh approximately 500 pounds each. The capacity of each is seventy gallons. Sixteen of these tanks are fixed to the framework. The others are called "slip-tanks," and have double functions, acting at times as ballast. The water ballast is carried in canvas containers. There are eight emergency containers—that is, four forward and four aft. The water is put in these emergency bags in accordance with the atmospheric conditions. They carry ballast weighing from 500 to 3,000 pounds.

There are three tanks of drinking water and one reserve tank containing distilled water, used in case of a shortage of drinking water. On the way over, the men were limited to a pint of water a day toward the end of the journey.

EATING AND SLEEPING QUARTERS.

The dining room is in the center of the ship, the only place where the deck is wide. It is about twenty feet long and eight feet wide. There are three tables on hinges fastened to the framework, the same as on ocean liners. Of course the officers and men use the same dining room. The food is already prepared but the men could cook if they wanted to by means of an electric stove in a gondola. They have to stand while they eat. The pantry is small, approximately two by four by eight.

The sleeping quarters are not very comfortable. The men sleep in light hammocks suspended from the framework. There are about ten hammocks, which are woven from Italian hemp. There is not much feeling of stability. If a man fell out of one, he would fall thru the fabric and out into the clouds. One cannot get a good, deep, untroubled slumber.

At the extreme end of the envelope there are no gas compartments—that is, for about twenty-five feet from the bow and from the tail there is vacant space. There are only two stationary electric lights inside the envelope, making it necessary for the men to carry electric flashlights.

The cockpits fore and aft are equipt with heliographs. The observer is not comfortable. He is compelled to stand upon an aluminum ladder with his head above the ship. The extra clothes carried by the crew are strapt to the side of the envelope. The crew of the R-34 brought only their dress uniforms with them on their voyage as extra clothing.

PARACHUTES FOR CREW.

Running along the deck inside the envelope are the parachutes and life-belts. These appliances are kept in canvas containers. The life-belts are inflated with air. They go around the chest, and when wrapt up look like a bundle of clothes. Both the parachutes and life-belts are always available. If overland the men were forced to leave the ship, the parachutes might save them, while if over the sea the parachutes and life-belts would both be used and might possibly save them.

It is not comfortable on the ship at all. The static electricity in the air might cause a fire and explosion. For this reason the men wear rubber slippers, sometimes cloth, for fear that the sparks from the nails in leather shoes might start a fire. The lightning rod is a piece of steel cable with a tassel on the end.

THE RADIO EQUIPMENT.

The R-34 is probably the largest of the lighter-than-air machines. It is exclusively of British design and construction, and is navigated entirely by the navigation officer from the forward gondola. This officer works from a bridge, much the same as the bridges on trans-Atlantic steamers, and controls the airship. In back of the navigation officer's headquarters is the "Wireless Room" fitted with four wireless sending and receiving outfits, the range of these varying considerably.

Lieut. R. F. Durrant of the *Royal Air Force* claims the following ranges for his Radio apparata: With a three-step ampli-

To the Editor of the Electrical Experimenter:

I regret that owing to circumstances beyond my control it was deemed advisable to postpone the publication of the article which I had intended for your August number. But the objections to its appearance will be shortly removed and I shall be pleased to forward it in due course for embodiment in your October issue.

Irrespective of this, I think it well on this occasion to notify your readers, as a precaution, that I am not one of those who display the sign "Do it now" on their desks and office doors. My motto is "Do not do it now. Think it over".

Very truly yours,

N. TESLA.

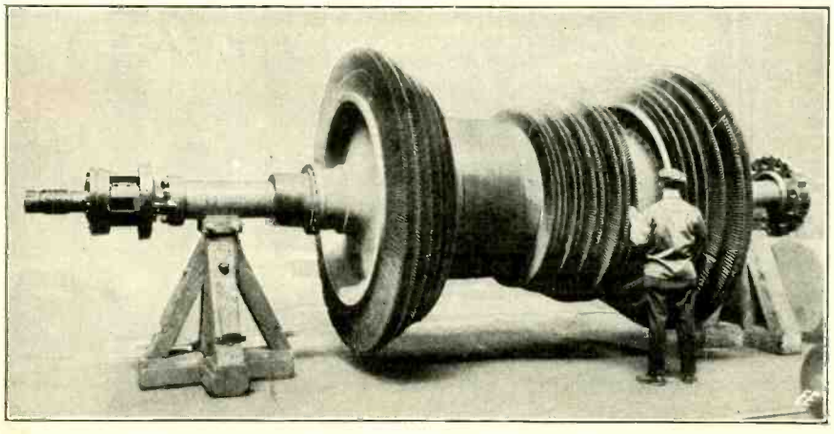
World's Biggest Turbine-Dynamo--100,000 H. P.

By WILLIAM H. EASTON

TO her already long list of "greatest things in the world," New York City can now add another item, for the Interborough Rapid Transit Company has recently placed in operation at its 74th Street power house a triplex turbine-generator that is as superior to its rivals in power as the Woolworth Building is in height or the arch of the Hell Gate Bridge in length of span.

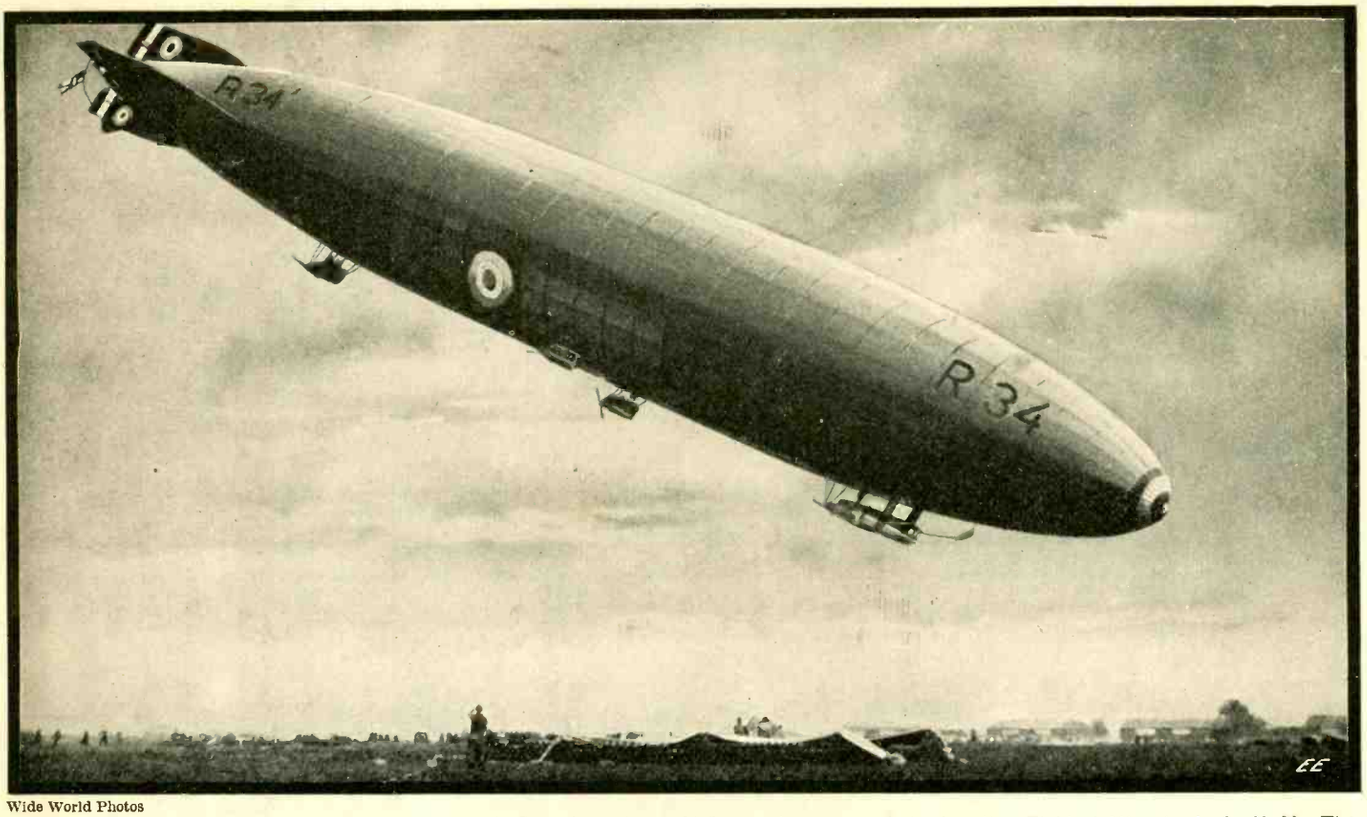
One hundred thousand horsepower is the amount of power this great engine can develop when pushed to its maximum. It is difficult to find an example that will convey an adequate impression of this figure, but the following may be of some assistance. Suppose our army now abroad, which consists of about a million men, has been landed over night and is marching up Fifth Avenue. Visualize the parades you have seen and then realize that it will take over three days and nights for this particular one, moving steadily forward in regular formation, to pass thru the Arch of Victory. Now, in a contest of strength between the turbine and all of these men taken together, the turbine would probably win.



How the Turbine Operates.

The visitor, journeying to 74th Street to see this great turbine, will probably be disappointed in its appearance. It has, indeed, a massiveness that speaks of immense power within, but in size it is dwarft by the old vertical reciprocating engine, of one-twelfth its capacity, beside which it stands; and in addition, since all its working parts are enclosed, it is entirely lacking in the fascination that visual movement imparts. But its deficiencies as a spectacle are real virtues in the eyes of the engineer, for they mean lower first cost, smaller space occupied, reduced installation and operating charges, and a high degree of reliability.

The very conspicuous difference in size between the turbine and the reciprocating engine is due to their different operating principles. The reciprocating engine consists essentially of a cylinder in which a piston is pushed up and down by the steam. The main parts of the turbine, however, are a spindle, carrying hundreds of small vanes, and a casing which encloses the spindle. The steam acting upon the vanes of the spindle revolves it as the wind turns a windmill. The motion of the turbine is, therefore, rotary and as there are no heavy parts to be stopt and started at the end of every stroke, as there are in a reciprocating engine, very high speeds are permissible, thus making it possible to develop great power from a comparatively small machine. The speed of this particular turbine is 1,500 revolutions a minute.



As has been said, the turbine is triplex; that is, it consists of one *high pressure* element and two *low pressure* elements, each connected to a separate electric generator. This gives it the appearance of three distinct machines, but it is actually a *single unit* and all three elements are started and controlled as one. The triplex arrangement is employed because it is mechanically greatly superior to the single element design for a machine of such great power. There is also the very decided additional advantage that, in an emergency, any one or two of the elements can be shut down without stopping the others. All the power eggs are, therefore, not in one basket, and the high efficiency of a single large ma-

A Close View of the Rotating Blades or "Rotor" of One of the Steam Turbines Comprising the Triplex 100,000 Horse-Power Generating Unit Recently Installed for the Interborough Rapid Transit Company, New York City, at Its 74th Street Power House. Almost Beyond Conception Is the Delicacy and Accuracy of Balance of This Wonderful Blading. It requires the Highest Degree of Workmanship to Build Such a Rotating Mass, Which Shall Be Perfectly Balanced When Revolving at 1,500 Revolutions per Minute.

The Rotor Member Here Shown Is Driven Around by High Pressure Steam Flowing Thru the Rows of Blading. A reaction Force Is Set up Owing to the Steam Passing First Between Stationary Blades and Then Thru a Set of Rotor Blades, Etc., Etc., Repeatedly. There Are Two Low Pressure and One High Pressure Stages In This Triplex Turbine Unit. The Steam Enters the High Pressure Chamber First, Then Expanding, It Passes Into the Low Pressure Elements, Thence Passing to the Giant Condensers.

Wide World Photos

An Exceptionally Fine Picture of the Giant British Dirigible—the R-34 Descending Toward the Landing Field at Mineola, L. I., N. Y. The Engines Are Kept Running While Descending, and the Rudders Altered to Steer the Ship Up or Down.

How the R-34 Crost the Atlantic

Details of the Giant 2,000,000 Cu. Ft. Trans-Atlantic Blimp

THE plucky English fliers succeeded in flying across the Atlantic Ocean, a course extending over 3,000 miles, in a gas bag known variously as a dirigible and blimp, and finally as her commander termed her, a "filleted rigid," meaning a rigid or framed gas filled balloon, having filleted or flat segmented sides. After making a successful landing at Mineola, L. I., N. Y., she sailed away on her return to England and landed there after a record-breaking voyage of 75 hours.

At Mineola the R-34 was hauled down and held by powerful cables, a large force of several hundred enlisted men being required to watch her day and night, in the event of wind gusts, storms, change of buoyancy due to the heat of the sun expanding the gas with which she was filled, and a hundred and one other expected but uncertain capers which the gigantic 670-foot "blimp" might cut up.

Some idea of her great bulk can be ascertained from the accompanying semi-sectional view of her, which shows the steering, eating and sleeping quarters, as well as many other interesting features.

LANDING TOWERS FOR DIRIGIBLES.

On her successful return to England the great airship was "anchored" to a new device designated by British Air Force engineers a "landing tower." Several of these towers are now in use in England for "anchoring" these giant lighter-than-air machines. They are provided with elevators to bring the crew and passengers to earth. The airship is held by the "nose" in such a manner as to ride a storm much more safely than if held to the ground. Such a device was described and illustrated in the July issue of this magazine.

Automatic landing and mooring are essential before airships can be put up as a commercial proposition.

Three points are being studied by the British technical departments now. One is moving the airship in the open, the second is the economy of man power required in landing, and the third the necessity for a good reserve of speed. This last is not a question of petrol supply, but of horsepower and the size of the ship.

A recent trial trip of the R-32 gave from 67 to 70 miles an hour, and she has 1,550,000 cubic feet capacity.

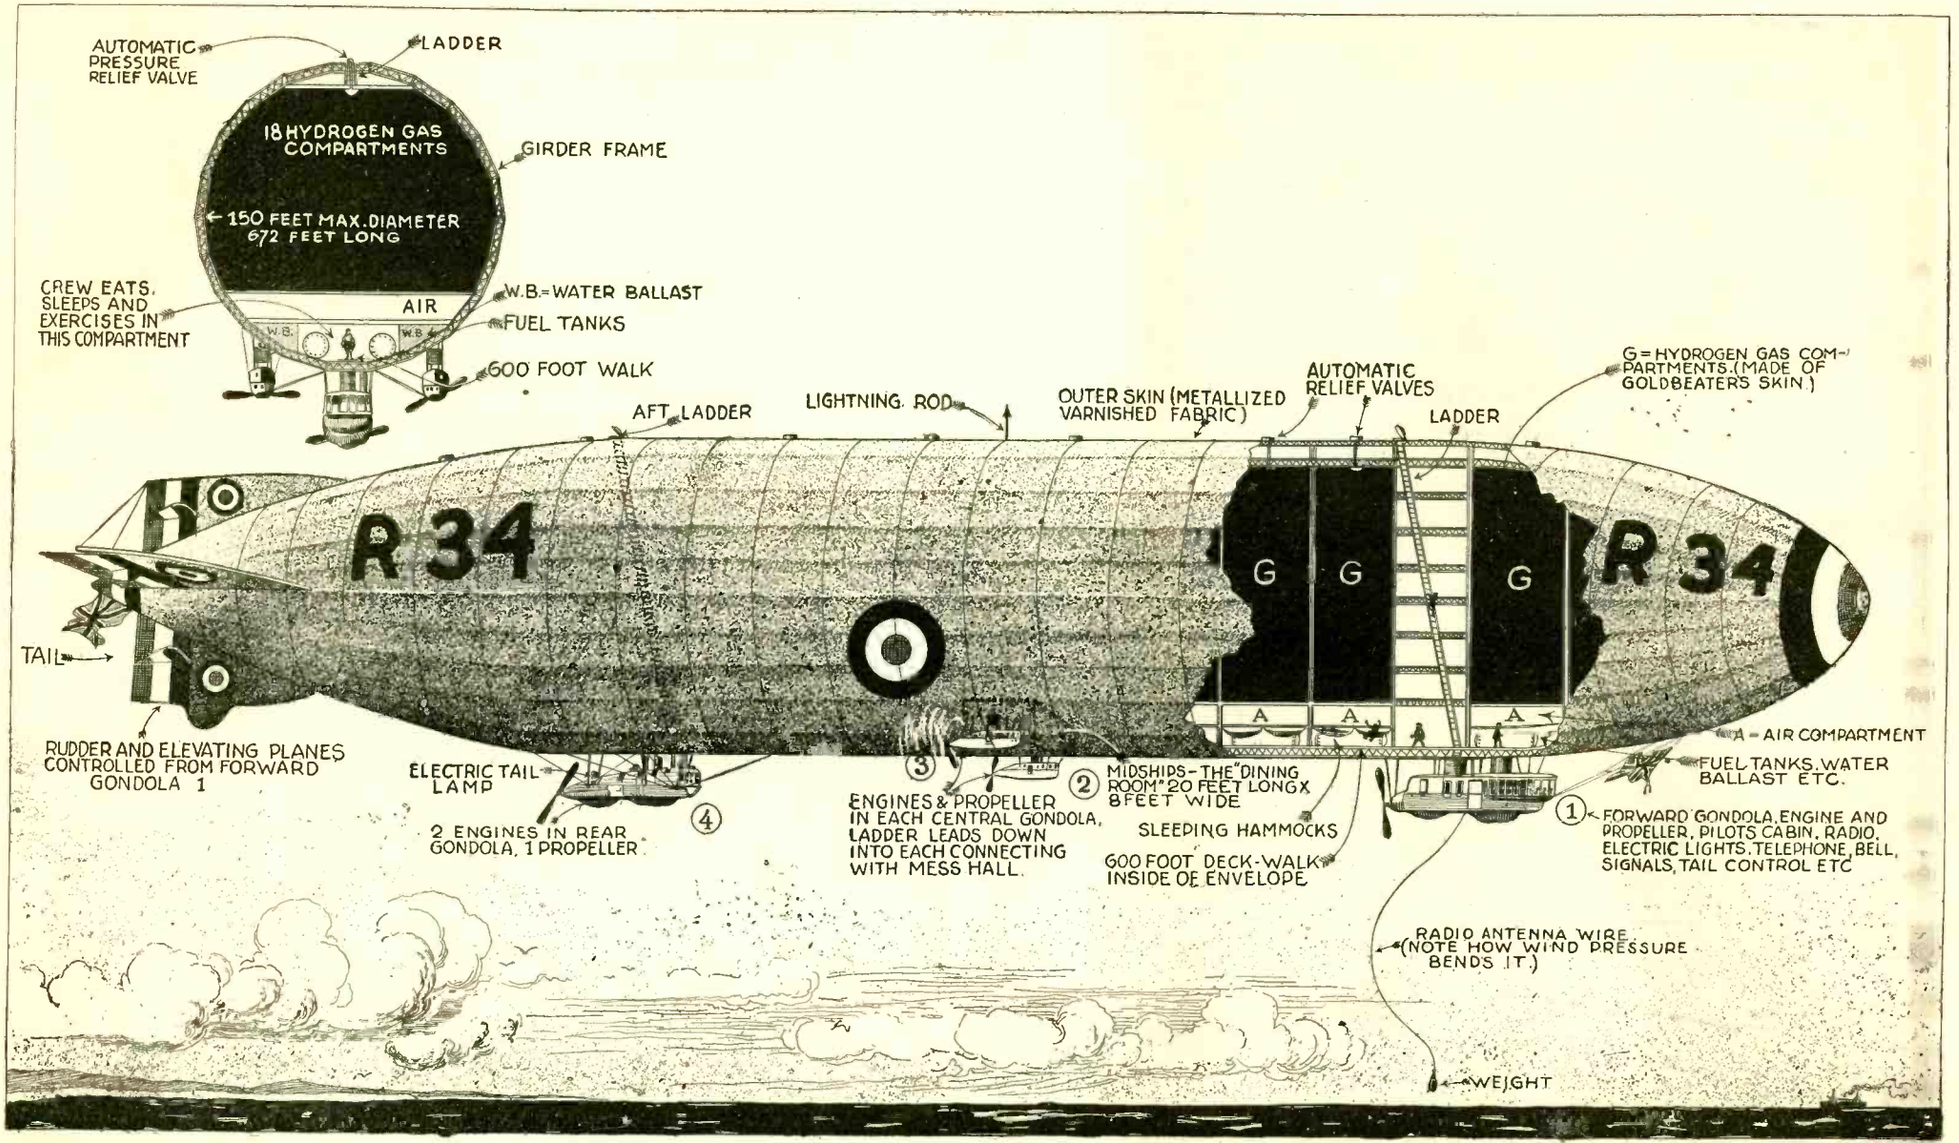
The R-34 has 2,000,000, and on her Atlantic trip reached approximately 60 miles an hour, but this is not going to be the speed of the future airship.

Major Scott, before he sailed, said he had no doubt that 100 miles an hour with proportionate "dispersal" lift, which is 50 per cent of the actual lift, would be obtained from airships that would be built with a capacity of 5,000,000 cubic feet.

Unless the size of the airship is increased, engines for this higher speed cannot be fitted, so that the experiments which the Admiralty is going to carry out will be vital to the commercial interests of the future.

Some idea of the wonderful aerial engineering features incorporated in the R-34, the first blimp to cross the Atlantic Ocean, can be gained from the following excellent description by Capt. Samuel T. Moore, commander of the balloon troop helping care for the transatlantic airship.

The forward gondola is the navigator's office and it is from this that the ship is controlled thru speaking tubes, electric bells and signals. The steering gear is also controlled from this gondola, as well as the rudder. On the side of this cabin are "elevator wheels" which control the elevators for changing the altitude when necessary. There is a table in the navigator's office on which charts are made while a flight is in progress. Many scientific instruments are on it, as well as the controller for the radio station. There is an engine in it, and immediately behind it are two more engines on either side. One or two of these engines work while the other sleeps. All the engines on the ship could be kept working if it were necessary, but as a general rule one of them is stopt and cleaned while the dirigible is in operation.



In the aft gondola are two more engines, making five in all—one in bow, two amidship and two at the stern. There are, however, only four propellers, the two engines at the stern having only one propeller. Two men are at work at the engines during the flight, one man operating and the other oiling.

DECK WALK 600 FEET LONG.

Inside the huge envelope there is a deck just 600 feet long and very narrow, covered with linoleum. It is not difficult for a man to balance himself as he walks along this deck, but it would be difficult for two men to walk it.

There are eighteen hydrogen gas compartments inside the shell, as shown in the semi-sectional view herewith. Nine of them have automatic valves, while the other nine are equipt with hand valves. The pressure of the hydrogen is not constant, but varies according to atmospheric conditions, with heat causing an expansion and cold contraction. This is regulated by the valves. If

THE "INSIDES" OF THE TRANS-OCEANIC AIRSHIP—THE R-34. THE FIRST DIRIGIBLE TO FLY ACROSS THE ATLANTIC

Imagine a gigantic airship resembling a huge sausage floating lazily thru the air over your head. This wonderful invention of man, measuring 672 feet in length, is nearly as high as the fifty-five story Woolworth Building in New York City, or three-quarters as high as the Eiffel Tower. The giant British airship, which successfully made the trip across the Atlantic Ocean from England to Mineola, L. I., N. Y., and return, was piloted by Major G. H. Scott and a crew of thirty men. On the trip over from England to America, her commander unconsciously carried a stowaway, a former mechanic who had worked on the ship in England, and who would not be cheated out of the first trans-Atlantic trip. The ship also carried a tabby cat as a mascot. The English Government has plans under way to build several new dirigible gas-filled airships similar to the R-34, but about twice its size. The R-34 carried approximately 2,000,000 cubic feet of gas. The accompanying illustration shows comprehensively some of the novel features in this first "Leviathan of the Air". The crew dined, slept and exercised in the long compartment running along the lower side of the gas envelope. The dining room is placed amidships and is 20 feet long by 8 feet wide. All the four suspended gondolas carried propellers and petrol motors for operating them, and the members of the crew had access to any of the gondolas as occasion required, by means of covered ladders leading down from the 600-foot walk and passageway at the base of the gas envelope. The crew slept in hammocks suspended from the framework of the envelope, just above the 600-foot walk, as shown in the diagram. In rising from the ground at the start, ships of the R-34 class do not operate their engines, but simply throw off their mooring cables, when they rise rapidly to a considerable height,—8,000 to 9,000 feet elevation. The big ship then finds her natural "equilibrium" point, and the commander gives the order to start the engines and propellers. The giant blimp, termed a "fileted rigid" by her commander, Major G. H. Scott, then comes under perfect control. To cause the ship to descend, is simply a matter of shifting the water ballast and raising or lowering the horizontal tail rudders. The ship is kept on an even keel by vertical tail rudders. Astronomical observations, such as "shooting the sun" with a sextant, are carried on by one of the officers, who climbs up an 80-foot ladder to the top of the airship, there being two of these ladders, fore and aft. The range of the special wireless apparatus is remarkable, signals having been transmitted from the R-34, 1200 miles, from off the Azores to England. Signals from England and America were copied in mid-ocean. Four distinct wireless sets were carried, including one "wireless telephone" set. The Dirigible has a much greater lifting capacity than the NC planes, and can not only carry a higher powered radio set, but can support a longer antenna when desired.

the valves should get stuck, something might happen. They have a manometer by which they read the pressure in the hydrogen tanks Ten millimeters is dangerous. Should the valves refuse to work a fire might start and the crew be forced to land or leap for life.

EIGHTEEN HYDROGEN TANKS

The eighteen hydrogen tanks are made of goldbeaters' skin, which is the intestines of calves. The final inflation—that is, the loading of petrol and hydrogen—takes place at the minimum temperature after the sun goes down. Flying over a warm city causes expansion, and over the sea, where it is cold, the bag is caused to contract. On the way over, while flying over the ice floes around Newfoundland, there was a contraction of 40 per cent.

When the machine starts to rise and the guy ropes are thrown off, she rises until she finds her equilibrium. It may be 500 and then it may be 3,000 feet. When she finds her equilibrium, the motors start. Meanwhile the wind carries her wherever it pleases. That is the reason why in most cases a start is made between midnight and dawn.

There are eighty-one tanks on board which contain petrol, and weigh approximately 500 pounds each. The capacity of each is seventy gallons. Sixteen of these tanks are fixed to the framework. The others are called "slip-tanks," and have double functions, acting at times as ballast. The water ballast is carried in canvas containers. There are eight emergency containers—that is, four forward and four aft. The water is put in these emergency bags in accordance with the atmospheric conditions. They carry ballast weighing from 500 to 3,000 pounds.

There are three tanks of drinking water and one reserve tank containing distilled water, used in case of a shortage of drinking water. On the way over, the men were limited to a pint of water a day toward the end of the journey.

EATING AND SLEEPING QUARTERS.

The dining room is in the center of the ship, the only place where the deck is wide. It is about twenty feet long and eight feet wide. There are three tables on hinges fastened to the framework, the same as on ocean liners. Of course the officers and men use the same dining room. The food is already prepared but the men could cook if they wanted to by means of an electric stove in a gondola. They have to stand while they eat. The pantry is small, approximately two by four by eight.

The sleeping quarters are not very comfortable. The men sleep in light hammocks suspended from the framework. There are about ten hammocks, which are woven from Italian hemp. There is not much feeling of stability. If a man fell out of one, he would fall thru the fabric and out into the clouds. One cannot get a good, deep, untroubled slumber.

At the extreme end of the envelope there are no gas compartments—that is, for about twenty-five feet from the bow and from the tail there is vacant space. There are only two stationary electric lights inside the envelope, making it necessary for the men to carry electric flashlights.

The cockpits fore and aft are equipt with heliographs. The observer is not comfortable. He is compelled to stand upon an aluminum ladder with his head above the ship. The extra clothes carried by the crew are strapt to the side of the envelope. The crew of the R-34 brought only their dress uniforms with them on their voyage as extra clothing.

PARACHUTES FOR CREW.

Running along the deck inside the envelope are the parachutes and life-belts. These appliances are kept in canvas containers. The life-belts are inflated with air. They go around the chest, and when wrapt up look like a bundle of clothes. Both the parachutes and life-belts are always available. If overland the men were forced to leave the ship, the parachutes might save them, while if over the sea the parachutes and life-belts would both be used and might possibly save them.

It is not comfortable on the ship at all. The static electricity in the air might cause a fire and explosion. For this reason the men wear rubber slippers, sometimes cloth, for fear that the sparks from the nails in leather shoes might start a fire. The lightning rod is a piece of steel cable with a tassel on the end.

THE RADIO EQUIPMENT.

The R-34 is probably the largest of the lighter-than-air machines. It is exclusively of British design and construction, and is navigated entirely by the navigation officer from the forward gondola. This officer works from a bridge, much the same as the bridges on trans-Atlantic steamers, and controls the airship. In back of the navigation officer's headquarters is the "Wireless Room" fitted with four wireless sending and receiving outfits, the range of these varying considerably.

Lieut. R. F. Durrant of the *Royal Air Force* claims the following ranges for his Radio apparata: With a three-step ampli-

To the Editor of the Electrical Experimenter:

I regret that owing to circumstances beyond my control it was deemed advisable to postpone the publication of the article which I had intended for your August number. But the objections to its appearance will be shortly removed and I shall be pleased to forward it in due course for embodiment in your October issue.

Irrespective of this, I think it well on this occasion to notify your readers, as a precaution, that I am not one of those who display the sign "Do it now" on their desks and office doors. My motto is "Do not do it now. Think it over".

Very truly yours,

N. TESLA.

Under-Water Surveying by Reflected Sound Waves

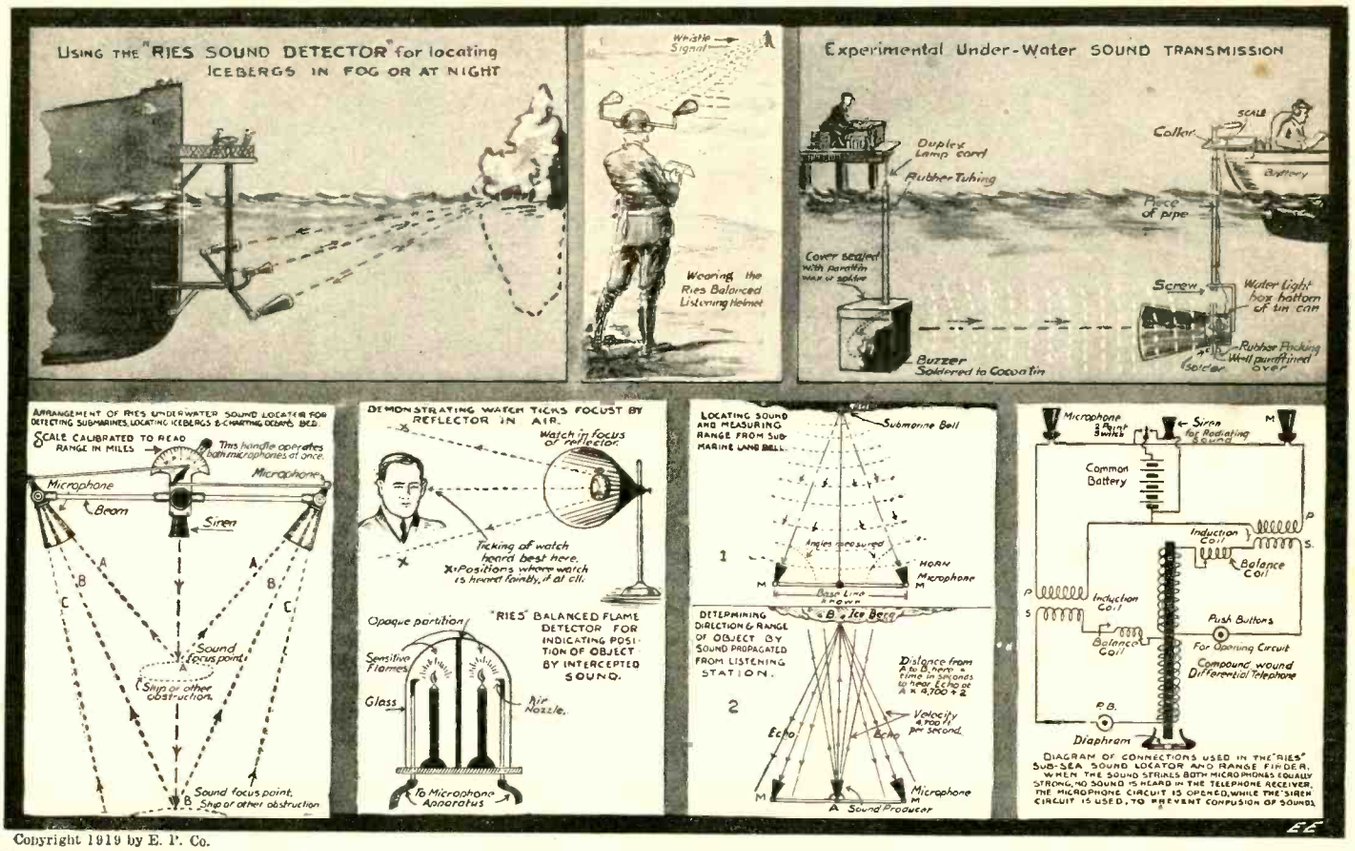
By H. WINFIELD SECOR

ASSOCIATE MEMBER AMERICAN INSTITUTE ELECTRICAL ENGINEERS

LOCATING invisible objects at distances of several miles under water is not such a new scientific fact, as several schemes for carrying out the detection of submarines by these sound waves, radiated from the propeller and engine of the undersea craft, were conceived and applied more or less successfully during the progress of the World War, and enemy submarines were trailed by means of submerged microphones or electrical sound detectors. But it has not been possible heretofore to utilize ordinary apparatus, such as a *single* sound detecting instrument located at a *single* point, to *accurately locate any object at an appreciable distance to within a few feet.* However, a New York inventor and electrical engineer, Mr. E. E. Ries, has been working for a number of years on a most ingenious *reflected-sound* scheme for locating various objects such as submarines, icebergs, charting ocean and river beds, etc., and the present article deals with the remarkable principle of sound wave triangulation, as evolved and perfected by Mr. Ries.

Our readers may probably remember having read several years ago of an "iceberg detector" operating on the sound wave principle, devised by Mr. Ries, in which two sensitive microphones fitted with horns were mounted at the extreme ends of a yardarm high up on the mast of a ship. To locate the distant iceberg, even in a fog or at night as well as day-time, a powerful siren placed exactly midway between the

The Ries Under-water Sound Detector and How it Works.



microphones on the yardarm or spar, was sounded. The yardarm carrying the microphones was then swung on the mast as an axis, until the "echo" reflected from the iceberg was picked up several seconds later in the microphones. By a special scale device attached to the pivoted microphone elements, the angles which they subtended when both were focust on the spot from which the echo rebounded, showed the distance in feet or yards, as the case might be.

Before going further into the details of Mr. Ries's most ingenious and promising system of "Subaqueous Surveying" by means of reflected sound waves, it will prove interesting to look into some of the principles of sound wave physics underlying the functioning of this latest scientific achievement. Moreover, as Mr. Ries pointed out, his system of sound wave triangulation overcomes all the weaknesses of the single, straight-line sound detectors, by utilizing a greater base line in his triangular determination of the source of the sound or echo, and by this means he confidently believes that ships, submarines, icebergs or other obstructions, including the depth, contour and nature of the ocean bed or rocky coast, *can be located quickly and precisely to within a few feet, even at a distance of eight to ten miles or more.* This seems all the more probable when the wonderful principle on which his system operates is more fully understood.

SOUND WAVES IN AIR AND WATER.

In the original scheme for locating icebergs or other objects projecting above the water, as devised by Mr. Ries some years ago, the propagation and reflection of sound waves, i.e., the echo, was based on the phenomenon of sound wave transmission thru the air. Sound travels thru the air at a speed of approximately 1,120 feet per second; it is well to keep in mind also that a sound traveling toward a certain point such as a rock or iceberg and rebounding from the surface of said object by reflection, will cause an echo traveling at the same speed also, or 1,120 feet per second. Hence, when listening for the echo, which you may sometimes do in parks or in mountainous regions where there is a rocky formation which will give a good clear echo at a considerable distance, you may time the distance with an ordinary watch provided with a second-hand, by counting the seconds required to hear the echo. But the time noted should be divided by two, and then multiplied by 1,120 in order to get the distance in feet. Sound wave propagation thru water is very much the same as that thru air, with the difference, however, that sound travels thru water at a much greater velocity than thru air, owing

The "Ries" Improved Under-Water Surveying and Locating Scheme, Utilizing Reflected Sound Waves Propagated thru the Water, Promises to Solve Many of Our Greatest Problems. Among These We Find the Locating of Sunken Ships, the Charting of River and Harbor Beds, Detecting and Locating of Enemy Submarines to Within a Few Feet of Their Actual Location, Etc. The Principle of Triangulation Employed Makes the Invention Extremely Feasible and Precise.

A Telltale Submarine Net

Submarines Will Have to Become Almost Human to Get Thru the Under-Water Nets and Mines Barrages of To-morrow. Here's a Telltale Net That Entangles the "Sub" and Sends up Rockets Signaling the Fact. Electric Light "Markers" Are Also Brought into Play.

THE vast experience gained by naval designers and inventors during the progress of the great war has taught them many things. The various means of protection against submarines have been quite extensively tried out, and while many theorizers have predicted failure for *anti-submarine nets,* still many hundred miles of nets were constructed and successfully employed during the war. A new form of *telltale submarine barrier* or net was recently invented and patented by one John P. Geraghty, of Jersey City, N. J. His invention covers a system of detecting submarines solely by the use of protective nets, so that anti-submarine operations can be carried out directly, and a few dozen "ash cans" (depth bombs) let go on the spot where the submarine is eventually located by the sub-sea microphones, et cetera, as now used by all of the leading navies.

The outstanding features of Mr. Geraghty's invention are that as soon as a submarine touches the net and tries to cut its way thru, or else bumps the net so hard that it carries it away, telltale signals will instantly be given, and which are effective either by day or by night. At night, rocket signals are shot forth from the anchor buoys of the net as soon as the net has been damaged or carried away by the lurking enemy sub-sea craft engaged on a surreptitious visit to the harbor or bay thus protected.

In this form of anti-submarine protective net, the net, which is of special design, is detachably fastened to sturdy anchoring devices, so that when a submarine strikes the net it can, with ordinary pressure, tear the latter away from the anchorages, which immediately causes signals or telltale means to be operated so that patrol boats, such as submarine chasers and destroyers, can at once give battle to the unseen enemy. The anchoring devices are provided with clever releasing catches, which when a certain amount of pressure is applied to the net, collapse and allow the net to be released from the anchorages. As soon as this happens, however, the collapse of the catches

Electrocuting Huge Leopard

It was a "shocking" affair, but those members of the Los Angeles moving picture colony who are in the habit of working with animals are breathing sighs of relief, for David, the big leopard of the "movie" jungle is no more. Sentenced to death by a jury of his peers, the big cat paid the extreme penalty by being electrocuted. According to Mr. Edwards, manager of the film company who owned the beast, most of the animals used in film work are very tame, but David had been acting treacherously for several months, and rather than risk the injury of anyone who might be acting with him it was decided to end his career. At first shooting with a high-powered rifle was considered, but fearing that this would disfigure the beautiful pelt which the company wished to preserve, the engineer of a large electric power station nearby was consulted and electrocution was decided upon. A large steel plate was placed on the floor of the cage and connected to a 6,000-volt power line at the power house. David was then placed on the plate, and another wire fastened to his leg, the juice turned on, and David was no more.

The execution of animals has received considerable investigation, especialy in the city of Boston, Mass., where there is located a specially equipt institution for electrocuting horses, cats, dogs, etc. The apparatus and special provisions arranged to carry out this work were described some time ago in the ELECTRICAL EXPERIMENTER. The method is not only advantageous in many different ways, such as the ease and certainty which which the animal may be killed, but also has received the highest commendation from humane investigators and scientists. The theory of electrocution tends to show that the high velocity of the current travels faster than the nerve wave itself, and therefore the animal is dead before any shock can be felt.

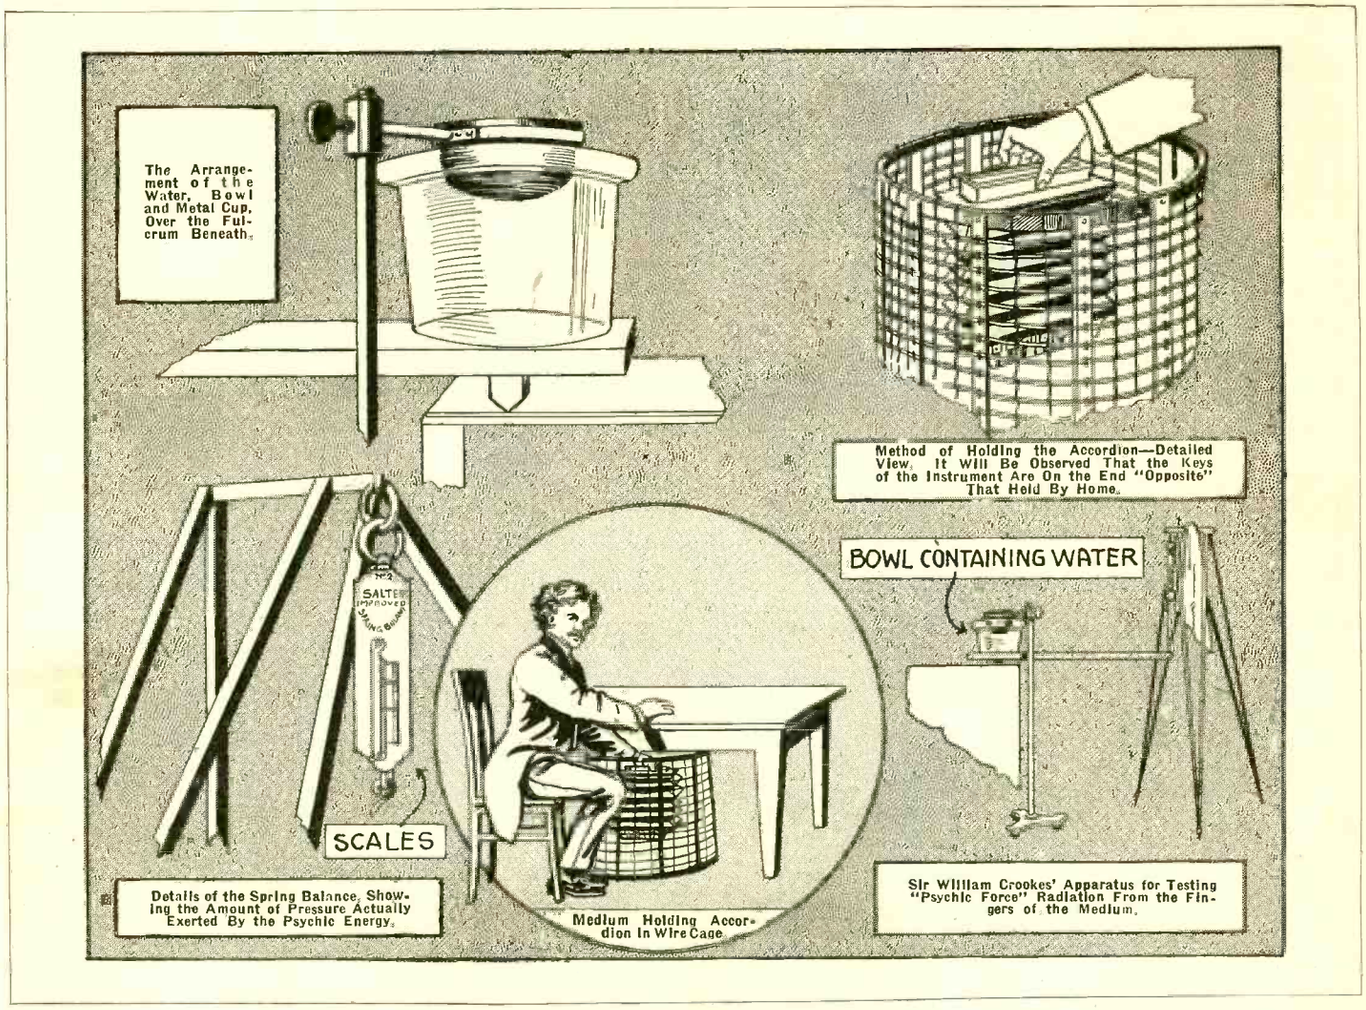
"David"—the Big Leopard of the "Movie" Jungle—About to Breathe His Last. One Throw of the Switch and He Paid the Final Penalty for His Treachery, Which Had Endangered the Actors' Lives.



Sir William Crookes' Psychical Researches

By HEREWARD CARRINGTON, Ph. D.

THE late Sir William Crookes, O.M., F.R.S., will always be regarded as one of the greatest scientists—as he was one of the greatest "psychical" students—of all time. His achievements in the fields of chemistry and physics alone insure the perpetuation of his name in scientific circles. He was the discoverer of the element thallium; he it was who first investigated many of the phenomena of radiation, which led to the ultimate discovery of the "Crookes tubes"—named after him—and which in turn have led to many important discoveries in the realms of chemistry, physics and medicine (the X-rays, etc.). He made many valuable contributions to the study of radium; he invented the "radiometer," which we now see in nearly every oculist's shop; he wrote many standard works upon chemical analysis, sugar manufacture, dyeing, printing, metallurgy, sewage, diamonds, and many other topics—thereby establishing his name as one of the finest, most ingenious and most practical scientific minds in the world, and leaving to posterity a veritable monument, in the shape of lasting and valuable achievement, of great practical benefit and value to mankind.

Sir William Crookes, however, was known not only for his interest in the problems of physics and chemistry, but also by reason of his interest in "psychic" phenomena, and his book "Researches in Spiritualism" is a classical manual on the subject, oft quoted, and a model of clarity and impartiality. Curiously enough, his researches into the phenomena of spiritualism were being undertaken during the very years (1870-74) when, in the opinion of many physicists, Sir William was doing his best work in chemistry, so that the charge cannot be brought against him that "he only became interested when in his dotage"; on the contrary, he was then in his prime—about forty years of age. It is true that Crookes maintained his interest to the day of his death, but he *wrote* very little upon the subject, contenting himself with patient research and investigation, which tended but to confirm his earlier researches. A brief summary of these cannot fail to be of interest.

Scientific Proof of Psychic Force or Spiritualism

IN publishing this article, we are aware that it is a very unusual subject to appear in a scientific magazine. We however, have approached the matter with an open mind, neither condemning nor upholding it. The reader must be the judge. We do not publish it with the mental reservation that "there might be something in it, after all," but we do believe that anything at all in science over which there has been a great controversy should be discussed as intelligently as it is possible. The author of the present article, Dr. Hereward Carrington, is a member of the Society of Psychical Research, and he is also the author of several interesting books, among others "Death: Its Causes and Phenomena;" "The Problems of Psychical Research;" "The Coming Science;" 'Psychical Phenomena and the War."

Sir William Crookes, one of the greatest scientists that ever lived, became converted to spiritualism after long and exhaustive experimental evidence which today seems irrefutable. Dr. Hereward Carrington clearly describes some of Sir William's experiences in this article, which should prove of unusual interest to our readers, whether it will convince them or not.

The majority of these experiments—which were chiefly conducted in Sir William's own home or laboratory—were made with the medium Mr. D. D. Home—a medium who produced extraordinary "physical" manifestations, and who was never detected in fraud in all his long career (Home was an intelligent man, who wrote several excellent books upon the subject himself). One of the earliest experiments was that with an accordion, held lightly between the thumb and fingers of Home's hand by the end *opposite* the keys. His other hand was visible and rested on the table. The accordion, thus held, was placed within a circular wire cage, which could be charged

(*Continued on page* 440)

Ever Hear the Tale of the Man (and Oh! Lawdy! the Woman) in "Upper Ten?" The Worries of the Traveling Public That Must Sleep En Route in Those Sardine Box Atrocities Known as "Berths" Are Finally Reduced to a Minimum; by Means of This New Telephone Checking System the Chance of Finding Your Berth Already Occupied by a Duplicate Ticket Holder Is Obliterated, Forever, We Hope.

Telephone Solves "Lower Berth" Squabble

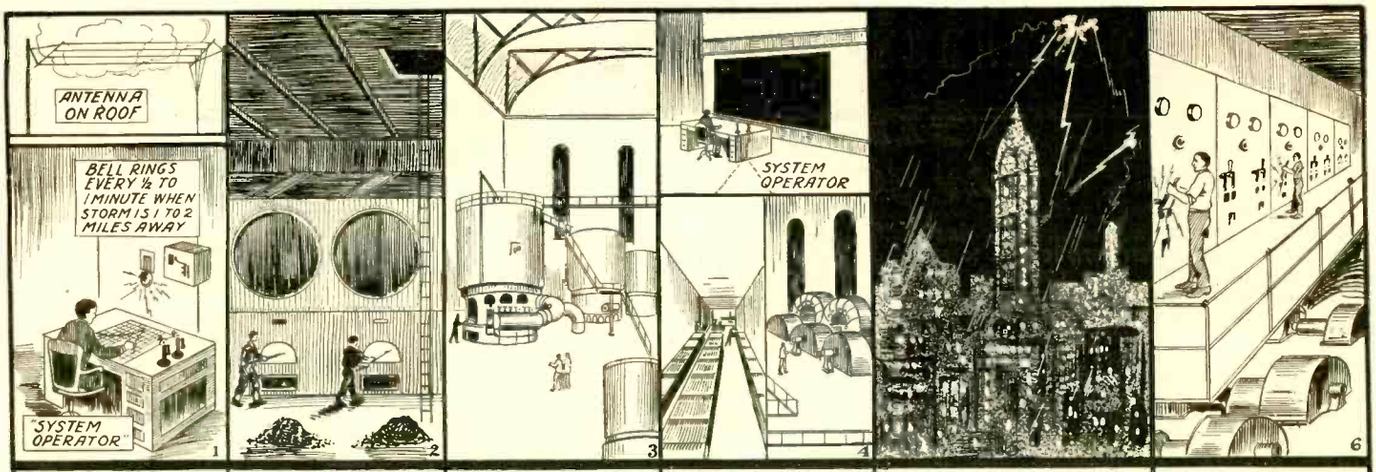
THOSE of you who have tried in vain to obtain a *lower berth* on a railroad train, only to find out that a friend of yours purchased one from a different window *after* you applied for yours, will doubtless be interested in the new method of booking applications which is in use at the present time at one of the large railroad terminals in New York City.

According to the old method, diagrams of each pullman car, with blank spaces for each berth, were distributed among the various stations and ticket offices. When you purchased your ticket, the number of your train ticket was entered in the space representing your berth, In this way the ticket agent knew just what berths were occupied and which were not. Yes, he did!

When the train left the station these cards were handed to the pullman conductor, who settled disputes as to the occupancy of the berths, according to the ticket number entered on his card. If two people claimed the same berth, the one whose ticket number appeared on the card was the fortunate individual.

(*Continued on page* 481)

New Continuous Panorama Advertising Display

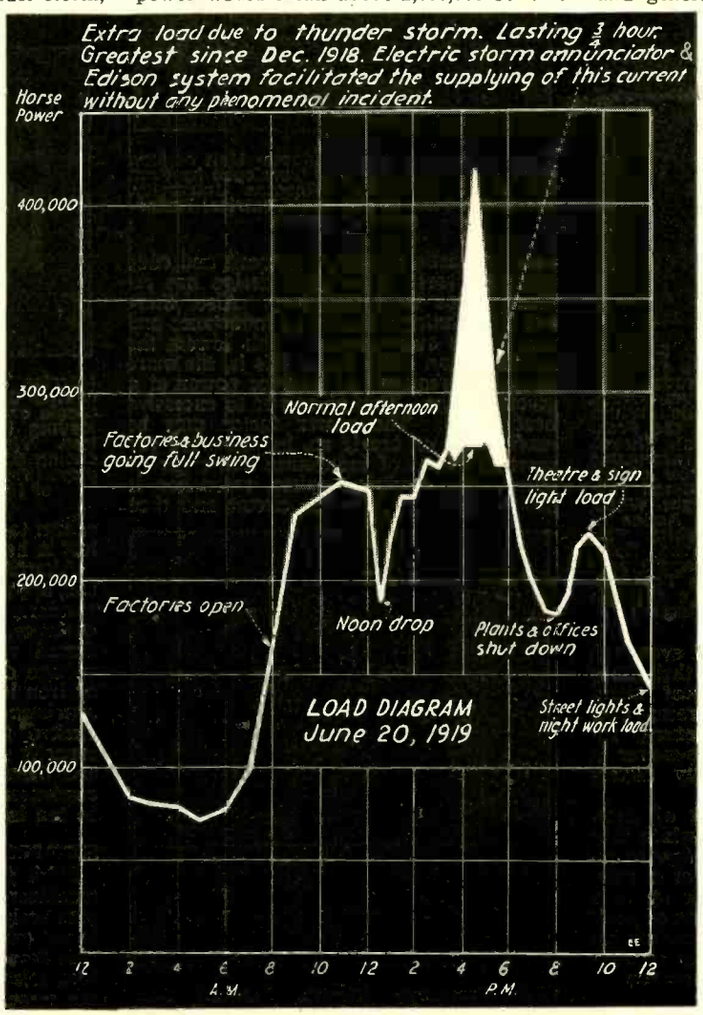


It is undoubtedly a fact that the long suffering public has been wont to see many advertising devices both good and bad exhibited in store windows, etc., designed with the intention (?) of securing their attention. Of these some have been rather unique and served their purpose admirably, but there have been many that have fallen by the wayside.

With these few words of introduction to our plot we come up against the difficult task of describing this new advertising device that to all intents and purposes eclipses them all. The main difficulty is to find a way that will make the explanation reasonably clear. It is called the "Endless" display machine, and as an advertising specialty it seemingly surpasses anything heretofore shown, in that it presents to a manufacturer, dealer or storekeeper a very neat and attractive way of telling the history of the manufacture of the goods he may be selling, with a wonderful grouping of photos much the same as a moving picture or panorama. It is only by some such means that customers are usually interested, as the eye readily transmits a picture to the mind that is bound to stick. In addition to the continuous moving picture there are a number of shelves provided at the base for the display of small wares.

A Mystifying Show Window Attraction—the Scene on the Revolving Disc Constantly Changes.

The circle covered by the moving disc is thirty inches in diameter, and is capable of showing three separate pictures on each sheet. It is adapted to display any advertising matter which is now used or has been used in posters, car cards, phrases, and in fact all written, printed or photographic matter. Each machine can hold 20 or more sheets each thirty inches in diameter; they are notched around the edge with a tough linen border which precludes their becoming torn or mutilated while passing thru the machine. The discs are slit and joined end to end in a flat pile inside the machine with the two free ends joined in a sort of twist, thereby enabling the action to be continuous both back and front. They are held in place both by a pivot in the center and also by the driving motor, which is of 1/40 horse-power and so geared that two friction pulleys bear on each side of the machine. Between these pulleys are set the edges of two discs and by a simple gearing process, each set of friction pulleys works in the opposite direction, thus making possible the continuously moving panorama.



200,000 Horse-power in One Hour

ON Friday, June 20th, 1919, the electric light and power service of the New York Edison Company was put to the severest test which the Waterside Station had ever experienced since December, 1918. This was a day on which a summer thunder-storm, coming up in midafternoon enveloped the city in darkness equal to that of 10 o'clock at night, the consequence being that about 2,000,000 electric lights were turned on almost instantaneously and the Edison Company had to meet this demand for more "juice." It occurred when factories and offices were going at full swing, hundreds of which suddenly switched on all the lights when the storm broke. Several factors enabled the company to supply the enormous demand for current. One of these we have described in a previous issue of the ELECTRICAL EXPERIMENTER — the "wireless storm announcer," which again stood in good stead.

This consists of a slightly modified form of an early model wireless receiving station, using a *coherer* and a bell as a decoherer, together with the necessary relays. In addition in the aërial circuit, are two spherical balls resembling a spark gap. These are placed 1-64th inch apart, and are used to prevent the causing of a false alarm by the surges emanating from nearby wireless telegraph sending stations. A condenser is placed in the ground circuit to prevent stray currents and a short-circuiting switch is used to silence the bell and protect the apparatus from heavy surges due to electrical storms, which may harm the apparatus and materially impair its usefulness.

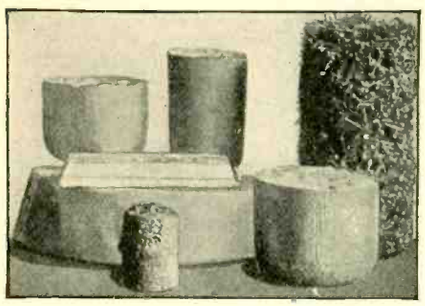
The demands of this generating station were raised by this increase in the use of current from approximately 250,000 horsepower, which is the normal daily business load, to nearly 425,000 horsepower, and due to the fact that all offices and factories were "carrying on" at the time, this load would naturally be almost exclusively of a lighting nature. From these figures an increase of 175,000 horsepower would mean about 2,000,000 50-watt lamps being turned on suddenly. Naturally enough, something had to be done in order to meet this demand, and inasmuch as the change from normal to the *peak* load came within less than an hour, it involved a close race against time to get the boilers and generators into operation in time to meet the approaching darkness that the coming storm would bring.

This Daily Load Chart Shows How the New York Edison Company's Output Increased Nearly 100% During a Recent Thunder-Storm.

At a large generating station such as at Waterside, there is generally one man and his assistants, who are able to conduct the affairs of the station with remarkable skill and precision—the "system operator," as he is called at Waterside. The system operator invariably keeps posted on the demands that are or may be made on the station for power and light, so as to direct the disposal of all generating machinery. Thus the station will afford the highest quality of service and will operate with maximum efficiency, i.e., he ascertains how many boilers should be maintained under load, and how many should be "banked," which machines shall carry the load and which shall remain idle. He also directs the switchboard operators as to which feeders shall be used to dispose of the output. As this routine is an everyday affair, it is conducted quite automatically, but the life of the system operator also has some of its thrills, especially when a storm approaches the city at a rate of about 45 miles an hour. The little thunder-storm detector, a view of which is reproduced here, does its share of the work. When a storm is approaching, and about one to two hours away, the gong on this storm announcer will strike about every fifteen or twenty minutes. This is only a "warning," and not much attention is paid to it, as it is very probable that the storm

(*Continued on page* 450)

Possibilities of High Frequency Currents



By JOHN E. PRITCHARD

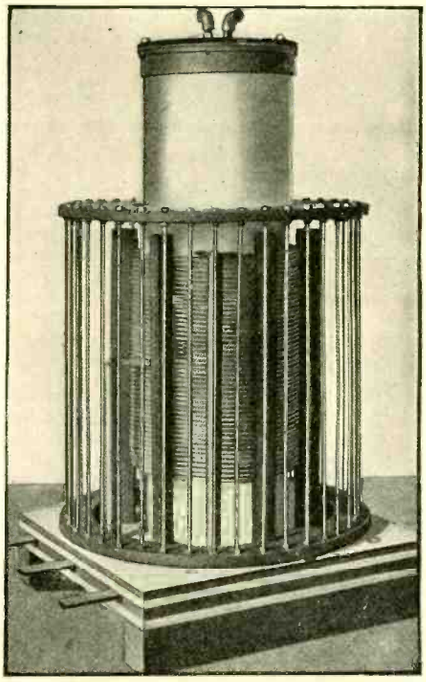
IN all branches of human endeavor there has been that characteristic trait to attain perfection. This condition has never been reached and never will; but like a variable approaching a limit, the difference between perfection and non-perfection can be made very small.

In the early development of electrical application, it was generally conceded that direct current transmission was a marvelous advance toward the ideal method of power delivery. Its flexibility over all others was evident, at that time. This advancement opened a new field of industrial engineering. Investigators were spurred on by successes, so naturally the field became extensive. Then the *disadvantages* of direct current became prominent. Economy demanded that power units be centralized. It was found that to transmit large currents long distances at low voltage, required very *large conductors* to reduce the heat losses, which are equal to the current squared, multiplied by the resistance. This draw-back was partially surmounted by the high voltage direct current generator; but due to the mechanical as well as current transformation difficulties, it has not been widely adopted.

LOW FREQUENCY ALTERNATING CURRENTS

Low frequency 60 cycle A. C. machinery, thru persistent research, has to-day reached

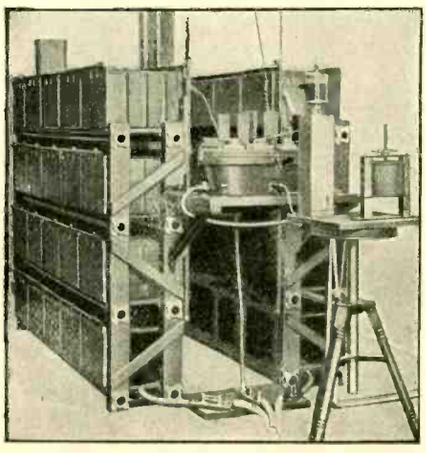
Melts From the High Frequency Furnace, Some of Which Resist Fusion Up to Temperatures as High as 1700° Centigrade. Such Include Tin, Lead, Zinc, Aluminum, Brass, Copper, Iron Cast and Electrolytic (Which Was Melted in Vacuum Without the Presence of Carbon, Even in Traces), Nickel, and High Silica Glass. As an Interesting Indication of the Unique Character of the Induction Possible, a Mass of Small Iron Nails Is Shown at the Extreme Right, Which were Cintered Together by the Action of Powerful "Eddy Currents." While This Action Is Proceeding, During the Early Stages of the Melting, Small Arcs and Sparks Tend to Weld the Many Particles Together. This Effect Is Obtained Only In a Crucible That Is Electrically Non-conducting.



a high degree of perfection. But even with our great power houses and their long transmission lines lighting great cities, propelling ponderous electric trains over high mountains and furnishing energy for every conceivable form of prime-mover in the industries, there exist many factors detrimental to perfection.

The reason for the great use of alternating currents is the ease with which they can be *transformed from one voltage to another*. They can be generated at a comparatively low voltage and stept up to a higher voltage. In the transmission of great power at *high voltage* there is required but a *small current*, and this, in turn, requires only *conductors of small cross-section*.

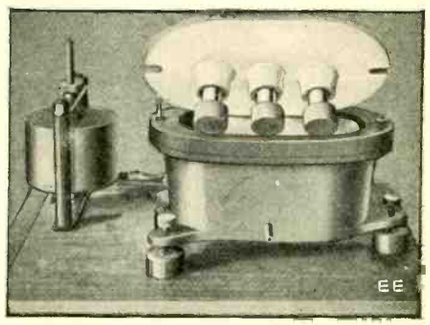
RESONANCE IN A. C. CIRCUIT.



Transformation is accompanied with

The High Frequency Furnace and Electric Power Transmission

Typical Vacuum-Type Inductor Unit of New High Frequency Furnace Developed by Prof. Dr. E. F. Northrup, Princeton University, Marking a New Era in the Electrical Refinement of Metals.



heat, magnetic leakage, hysteresis and eddy current losses. First class design has reduced these to a minimum. Also, there are *disadvantages* caused by inductance and capacity in every circuit. This lowers the *power factor*. The lower this is, the more current is required to produce power at a given voltage. This gives rise to excessive heat losses. The power factor may be made unity or nearly so, by *balancing* the reactive effects of inductance and capacity. When this condition exists, resonance is said to take place in the circuit and then

High Frequency Electric Furnace Condensers and Spark Gap. These Furnace Outfits Have Been Built In Sizes Up to 50 Kilowatts.

Ohm's law holds true, C=E/R. It is very desirous not to have this in practise, due to the great strain placed on the circuit. The voltage, as well as the current, may reach abnormal values under such conditions. In fact, the potential on a long transmission line may be 10 per cent higher at the distant end than at the generator end, due to these resonance conditions. In one case a 10,000-volt A. C. transmission line showed 11,000 volts at the distant or load end of the circuit.

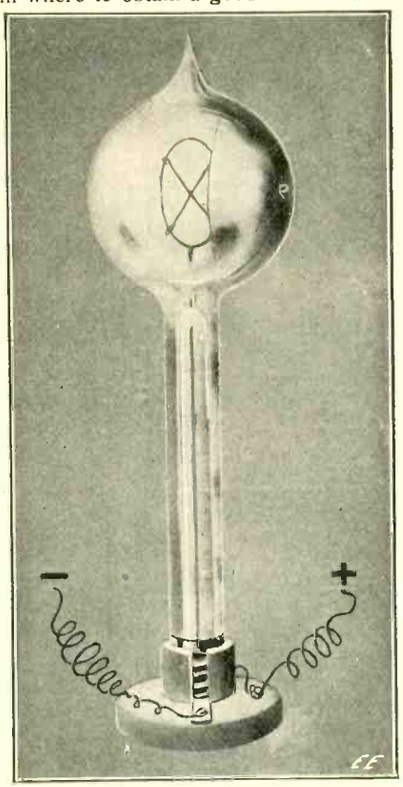
This phenomenon may be illustrated by the mechanical analogy of a pendulum six feet long, on the foot of which is hung a weight of one hundred pounds. Strike the weight with a force of ten pounds. Call this the *positive* impulse. When it has traveled the full length of its arc, give it another ten pound blow. This is the *negative* impulse. Now the pendulum will oscillate freely. The time for a single vibration will always be equal, regardless of the length of its arc; therefore the impulses will occur at equal intervals of time and will be analogous to an alternating current delivered to a resonant circuit. The amplitude of the swing will get greater and greater until finally the energy represented in the moving weight is *many times larger than the individual impulses*. These are called *free vibrations*. But if the forces are not applied at the instant of the weight's

Interior View of Discharge Gap. The Discharge Gap Shown Is Adapted for Either Single or Two-Phase Operation. It has No Moving Parts and Is Substantially Noiseless. The Gap Is Very Effective in Producing Strong Oscillations and May Be Employed for the Conversion of Large Amounts of Power Into Oscillatory Currents.

return to center, part of the energy will be lost in heat. These are *forced vibrations*.

Alternating currents, in present day practise, applied to induction motors and transformers, are impeded by resistance, inductance, and capacity; giving rise to these forced vibrations. This condition causes voltage drop, low power factor, hysteresis or iron losses, and eddy current losses. A *synchronous motor* on the line with an over-excited field, furnishes an equivalent of capacity and tends to neutralize inductance and thereby makes the vibrations free. A condenser would do the same, but it would be too large to be practical.

HIGH FREQUENCY ALTERNATING CURRENTS.



High frequency alternating currents and machinery for producing them are comparatively new. This field of application is not extensive. There has been considerable development on the large scale in wireless telegraphy and telephony. But here the power has not, up to the present time, exceeded a few hundred kilowatts, and it

NEWEST ELECTRICAL DEVICES

PHOTO-ELECTRIC CELL SUPPLANTS SELENIUM.

Experimenters in many fields of science, including those interested in astronomy and certain branches of the electrical and radio arts, have very often faced the problem where to obtain a good selenium cell—

New Light-Sensitive Photo-Electric Cell and Below—a Diagram for Using the Cell as a Detector for Radio-Telegraphy or Telephony.

the well-known instrument which, when exposed to light, lowers its electrical resistance, thereby causing a relay connected with it to operate one or more local circuits. Not only was the question of where to obtain the cell often unanswerable, but the best selenium cells which have been available now and then on the American market have left much to be desired. This is so for several reasons. First, the element *selenium*—even tho it possesses a most wonderful natural quality of changing its electrical resistance in proportion to the amount of light thrown on it, and raising its resistance as the degree of darkness is increased—does not do this instantaneously, nor anything like it.

The newest advance in science is the *photo-electric cell.* This device, which has only recently been perfected so as to be available on the commercial market, is shown in the accompanying illustration and diagram. Not only is it useful where *light-operated* circuits are necessary and desirable, but it can moreover be used for receiving radio signals, as its designers have pointed out. Its arrangement in the radio receiving circuit is shown in the accompanying diagram.

The photo-electric cell apparatus is somewhat similar in principle to the selenium cell, in that it changes its inherent electrical resistance in proportion to the amount of light falling upon it. As its designers and builders state, the cell is not liable to lag as in the case of selenium, and there is no dark current whatsoever. It is said to be very constant and reliable in its action, and can be used to great advantage in stellar photometry. The applied potential for this cell is 220 volts. A cell of this type has a wider field of usefulness in many respects than a selenium cell, and it will carry a considerably larger current.

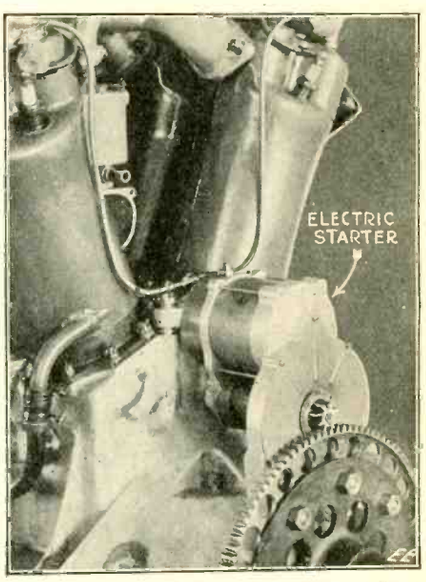
This photo-electric cell is very cleverly made up with a screw base fitting a candelabra socket. The rubidium screen inside the bulb connects to one terminal of the screw base, while a wire leads down from the silvered glass electrode facing the screen to the second contact member of the screw base. All that is necessary in connecting up the cell is to attach the two circuit wires to each of the two terminal screws on the base.

MAKING YOUR OWN FLASHLIGHT BATTERIES.

One of the latest advances in the flashlight art is the home-made battery outfit illustrated in the accompanying photograph. These outfits are priced so as to give about 25 per cent reduction in the cost of the batteries if purchased in the regular way, and each outfit will make three *two-cell batteries* or two *three-cell batteries,* there being suitable materials included to make up six flashlight battery cells. The outfit is supplied in two styles—one battery outfit includes a tubular flashlight, while the second outfit has a renewal equipment only, comprising the necessary parts, chemicals, etc., to make the six single cells as aforementioned.

As the makers point out in their instruction brochure accompanying the battery outfit, one of the principal advantages of this set is that the cells do not deteriorate in the least while they are standing, and so the person using these flashlight batteries has the satisfaction of knowing he is adding from 50 to 100 per cent to the life of his flashlight battery, which ordinarily is wasted, so far as the life of the battery is concerned, by standing on dealers' shelves, and in transit between the factories and dealers.

The liquid solution used in mixing the paste for the cells is placed in a graduated bottle. The proper quantity for each cell is marked off on a graduated label, which shows just what quantity to pour into each cell. Next, a chemical powder is placed in the solution and stirred well with a mixing stick accompanying the set. The carbon element, after being immersed in water for a few moments, is placed down



The Latest in Flashlights! Make Your Own Batteries.

into the zinc cylinder containing the solution, which has been thoroly stirred, and by pressing the cork supporting the carbon element down flush with the zinc cup, it is held firmly in place by bending over three zinc prongs. A cardboard cylinder suitable for holding three cells accompanies the outfit.

NC PLANES HAD ELECTRIC SELF-STARTERS.

It is not generally known that the NC flying boats which accomplisht the successful trans-Atlantic flight were the first heavier-than-air machines in this country to be equipt with electric self-starters for each of their big Liberty engine motors.

The result of the Navy Department's decision to so equip its seaplanes undoubtedly aided the success of the enterprise, for the NC-3, lost in the sea and fog near the

The Famous "NC" Planes Had Their Liberty Motors Fitted with Electric Self-Starters, as Shown in the Photo Herewith.

Azores, all her engines stalled, wet and cold, would never have been able to taxi into Ponta Delgada under her own power without the assistance of mechanical means for starting her propellers.

The picture shows this little starter attached to the propeller shaft of one of the big Liberty motors which drove our seaplanes thru the air.

This little device consists of a small 12-volt electric motor operated by a storage battery, connected thru a geared reduction to an automatic screw drive. On the end of the screw shaft is cut an 8-tooth pinion which meshes with a larger gear mounted on the propeller shaft. The starter will turn over the engine at 40 to 50 R.P.M. with a consumption of 100 to 110 amperes and a maximum of 1,300 foot-pounds is available on the engine crank shaft, for breaking loose a cold engine. When the engine begins firing the screw drive automatically demeshes from the crank shaft gearing. The storage battery weighs 26 lbs., and has a rating of 24 ampere-hours—or sufficient to supply enough current to make 150 starts on one charging.

An interesting incident of the American trans-Atlantic flight was that all three planes carried extra propellers, intending if one should break to descend to the water, change propellers, and start off again. They depended on the starter to make this possible.

It is also said that the C-5 (Blimp) met such strong headwinds on her trip from Montauk Point, Long Island, to Newfoundland, that the force of the wind stopt her propellers, and it was necessary to ascend to a higher level to avoid them, the starter with which she was equipt starting the engines while in mid-air.

How Cool and Orderly the Electric Range Kitchen Looks. No Heat Wasted Here in Warming Up the Kitchen and No Smoke, Gas or Smell.

Electric Cookery—A Snap!

By GRACE T. HADLEY

Society for Electrical Development

THE history of human culture might be said to be largely the science of food preparation. Thru the ages the arts of fire were slowly developed. Wood, coal, oil and gas have been successively used in the production of artificial heat for the purpose of cookery. Until the last century fire was the most useful thing in the service of man.

To-day electricity is doing all that fire ever did, and is doing it better. Electric cookery is as superior to fire cookery as the electric light is to the tallow dip. Electricity is performing tasks beyond the limits of flame. Fire to-day yields motive power with many times the economy it did one hundred years ago. This motive power is the source of modern electric currents. This power as electric current enters silently and swiftly into the modern home and is the source of electric heat in the modern cook stove.

As refinement of living increases, electric cookery solves the problem of easy control, of elimination of waste, the uncertainties of temperature. The heat can be regulated with almost mathematical precision. When it is no longer needed the current can be turned off and no waste occurs. The time is close at hand when cookery will cease to be carried on by "guess-work." Many women already realize that it pays to put this work on a more scientific basis.

The temperature factor in cookery is one that ought to be thoroly standardized. In the art of baking a loaf of bread, for instance, there are many factors that must be precise, in order to insure best results. There is no reason, if conditions are exactly the same, especially temperature conditions, why the cook should not be successful with her baking, regardless of "wind in wrong direction."

The objects of cookery are to render food more digestible, to make the food more appetizing and to improve its appearance. In the cooking of animal food, the improvement of appearance and flavor is most important. Cooking foods rich in protein may decrease digestibility to some extent, but the increased attractiveness of well-cooked meat may render it more digestible by causing greater flow of digestive juices.

ROASTING.

Roast Beef.—Remove the baffle plate. Turn both oven switches to *High* and let oven heat twenty minutes. Place the roast on the rack in the dripping pan, rub with salt and dredge the meat and pan with flour. Put in the roast to sear for about four minutes to each side. Then put in the baffle plate and turn *lower* oven switch to *Medium*. After twelve or fifteen minutes turn the *upper* oven switch to *Medium*. The total time of roasting should be fifteen minutes to the pound. If the meat is lean, put drippings or hot water in pan for basting.

There is said to be a saving of about 15 per cent in roasting meat electrically. Considering the price of meat to-day, this is quite an item. The following actual test of a 4 pound roast is interesting, illustrating the exact steps in the process of roasting the meat and the actual loss of weight by shrinkage:

Weight of roast, 4 pounds.

Preheat oven to "4," requiring twelve minutes at 110 volts.

Prepare roast; turn upper unit off.

Roast on "Full" five minutes per pound (lower unit).

Roast on "Medium" five minutes per pound (lower unit).

Roast on retained heat one hour.

Weight after roasting process, 3 pounds, 7 ounces.

Time of roasting, 1 hour 40 minutes.

Watts, 990.

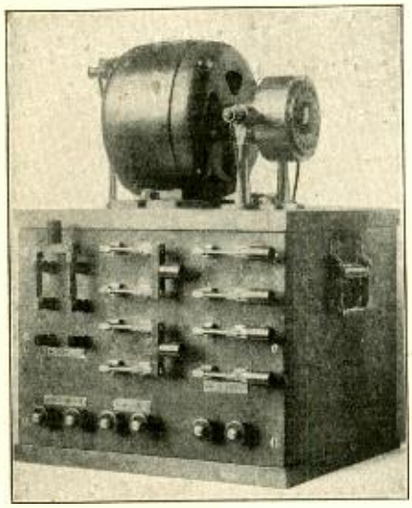
Roast Chicken.—Turn the oven switches on *High* for twenty minutes in advance. Rub the chicken over with soft butter and salt, dredge chicken and pan with flour. When the flour is well browned reduce the oven heat to *Medium;* baste well. When the breast meat is tender the chicken is sufficiently cooked. A chicken requires about one and a half hours, or about twenty-three minutes to the pound.

BAKING.

Biscuits.—The best results are obtained by having a hot oven to start with, so turn oven switches on *High* for thirty minutes in advance. If pans are placed on middle grate the biscuits will bake an even brown on top and bottom in ten minutes. If placed on the top grate the pans will need changing to the bottom grate as soon as the biscuits are well browned on top. Leave the oven switches on *High* during entire baking.

Bread.—Turn oven switches on *High* for thirty minutes in advance. The loaves should begin to brown in the first fifteen minutes of baking, after which the heat should be reduced to *Medium* for thirty minutes.

Muffins.—Turn over switches on *High* for twenty minutes. Bake twelve to fifteen minutes on *Medium* heat.



Sponge Cake.—Place the cake in a cool oven. Turn the oven switches on *High* for ten minutes, then to *Medium,* and bake from thirty to forty minutes longer. The cake is done when it falls back to a level and springs to the touch.

Cup Cakes and Pastry Shells.—Turn the

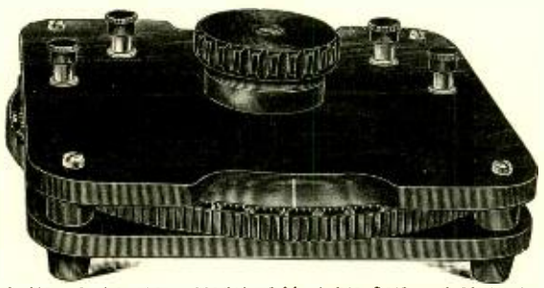
New Things Electrical

A NOVEL ELECTRIC FAULT LOCATER.

A Novel and Efficient Fault Locater for Electrical Testing of Cable and Transmission Circuits. It Detects and Locates Faults On Cables Carrying As High As 15,000 Volts.



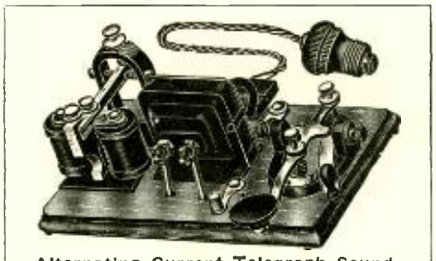
The new electric *fault locater* is a device designed for the purpose of locating all kind of faults that are inherent on overhead electric lighting and power lines carried on poles, and also on lead covered cables insulated with paper, rubber or cambric, which may be drawn into underground conduit systems.

The device is claimed to be capable of detecting and locating the faults upon cables carrying a working pressure up to 15,000 volts, alternating current, 60 cycles frequency. This apparatus is fitted with a special analyzer and interrupter.

Another valuable feature of this apparatus is that it readily locates grounds and short-circuits on steel taped armored cable, two or three conductor, laid directly in the earth.

A VARIABLE SELF AND MUTUAL INDUCTOMETER.

The inductometer illustrated herewith consists of two pairs of stationary coils and one movable coil, the latter being mounted on a disk placed between two outer plates holding the stationary coils. The disk may be rotated and has two scales, one calibrated in millihenries reading self-inductance and the second in degrees. The instrument is ordinarily provided with a maximum inductance of 50 millihenries, but instruments with higher maximum values or lower values can be obtained.



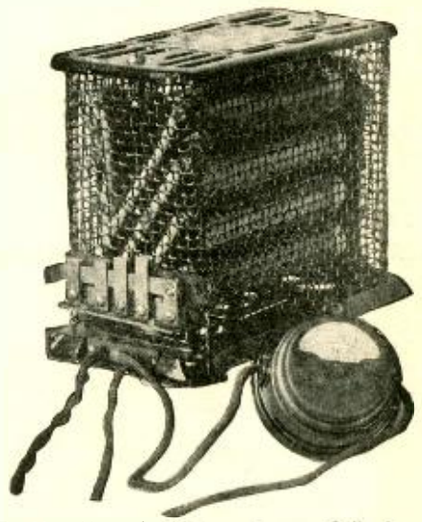
A New Laboratory Model of Variable Self and Mutual Inductance, Having a Maximum Inductance Value of 50 Millihenries. Larger Sizes of the Inductometer Are Available.

The inductometer has six link-shaped coils. The four fixt coils are mounted in pairs in the two outer fixt plates, which are held together by four screws and separating pieces to form the body of the instrument. The two movable coils are mounted on the inner disk and are placed with their long axes at right angles to a diameter. The outer plates and the disk are made of molded bakelite. To use the instrument as a variable mutual inductometer the fixt and movable coils are used as primary and secondary respectively and no connection is made between them. The mutual inductance is found by subtracting a constant from the scale reading and dividing the remainder by two. This constant is given with each instrument, altho it may be readily determined by the user at any time. It is claimed that errors due to stray field effects are eliminated and that the meter has a desirable ratio of maximum inductance to minimum inductance.

ALTERNATING CURRENT TELEGRAPH INSTRUMENT.

This A. C. telegraph instrument consists of A. C. sounder, steel lever key, and step-down transformer, mounted on base, as shown in illustration, with cord and attachment plug. No battery is used with it. It can be used on the 110 volt, 60 cycle alternating current lighting circuit by screwing the attachment plug into lamp socket.

Two or more instruments may be connected in series, just the same as instruments with batteries, by attaching the primaries of the transformers in multiple to the 110 volt 60 cycle lighting circuit with the secondaries and the sounders all in series. which is done by simply screwing the attachment plugs into lamp sockets and connecting the instruments in the usual way, thru their binding screws or terminals. Two terminals or binding posts and a single point switch are mounted on the base of each instrument.



Alternating Current Telegraph Sounder, Key and Step-Down Transformer. Operates by Plugging In On Any 110 Volt, 60 Cycle A.C. Lighting Circuit.

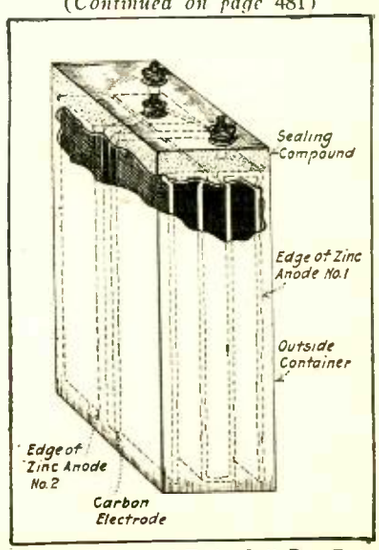
In working two or more instruments on a line, polarity of impulses must correspond. If instruments work independently (with switches closed) but do not work together with the switches open, simply reverse one of the connecting blocks and they will respond properly.

When it is desired to operate two or more instruments on a line, the terminals are used for connecting the instruments in series: when used this way, the single point switches should be left open. Closing a switch localizes the instrument, so that it can be used for practise without interfering or being interfered with by other instruments on the line.

These alternating-current telegraph instruments are coming rapidly to the fore in commercial as well as private practise. They save the initial expense and the heavy maintenance cost of batteries.

NEW D. C. BATTERY CHARGING RHEOSTAT.

Do You Have to Charge Storage Cells from Direct Current Circuits? If So, You Will Find Extremely Valuable This Latest Battery Charging Rheostat and Ammeter. A Switch Varies the Current Strength.



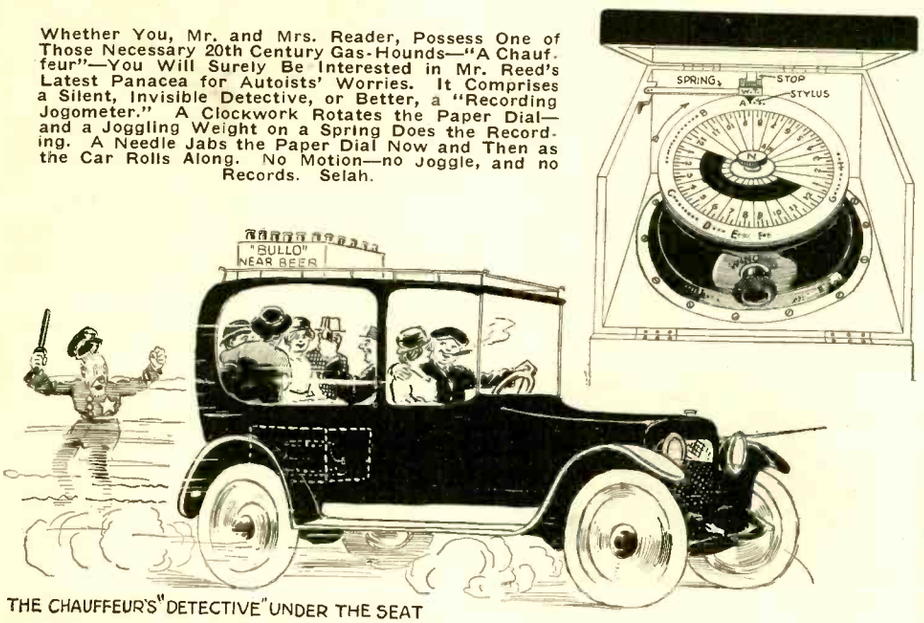
It is the purpose of this new charging rheostat to control the flow of direct current thru the battery, where the voltage of the charging circuit or line is much higher than that of the battery to be charged. This is done by means of a series of special high resistance coils made up in portable form, together with a current regulator switch giving charging rates of 1½, 3, 4½ or 6 amperes.

The voltage range of the rheostat takes in a single cell of battery up to 9 or 12 cells of 18 or 24 volts. The back pressure from a battery of higher voltage than this would cause a slight reduction in the ampere charging rates.

TWIN CELL DESIGN OF DRY BATTERY.

A new design of dry battery which is known as the "Twin Cell" is here illustrated. This design as shown in the illustration contains three electrodes, one positive flat carbon electrode, 7/16 in. thick by 1¾ in. wide, by 6 in. long, and two negative electrodes,

(*Continued on page* 481)



Novel Design of Twin-Cell Dry Battery. It Develops a Voltage of 1.5 to 1.55 Volts On Test and On Short-Circuit a Current of 35 Amperes.

Recording Your Chauffeur's Joy Rides

By Thomas Reed

MY neighbor, Theophilus Marbleback, had a chauffeur named "William," which innocent-sounding name was camouflage for a most guileful nature. "Circumstantial evidence" indicated that he was much addicted to joy-riding, and "Marbleback" desired me to invent an instrument for recording, unknown to "William," the moments devoted to this practise. He said that keeping tabs on the speedometer register was useless. That usually reliable instrument recorded only sorrows, not joys, for "William" deftly disconnected it during his mirthful moments. He didn't disconnect the gasoline bill, which came in at the end of the month robust and hearty, showing (if you integrated it only with the legitimate journeyings) a mysterious mileage of about five to the gallon; but apart from that, he was a busy and efficient little disconnector, and I was advised that my detecting device had better not depend upon the car's mechanism in any way, or it would be sure to reverse the excellent principle of the cascaret, and *sleep while "William" workt.*

Whether You, Mr. and Mrs. Reader, Possess One of Those Necessary 20th Century Gas-Hounds—"A Chauffeur"—You Will Surely Be Interested in Mr. Reed's Latest Panacea for Autoists' Worries. It Comprises a Silent, Invisible Detective, or Better, a "Recording Jogometer." A Clockwork Rotates the Paper Dial—and a Joggling Weight on a Spring Does the Recording. A Needle Jabs the Paper Dial Now and Then as the Car Rolls Along. No Motion—no Joggle, and no Records. Selah.

THE CHAUFFEUR'S "DETECTIVE" UNDER THE SEAT

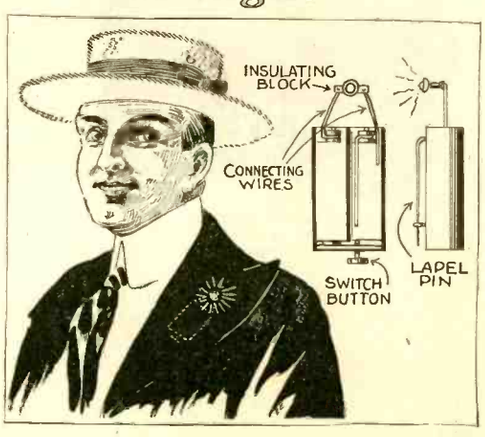
"Marbleback" had a grand theory that if he could once get the goods on "William"—show them to him all registered up on some neat mechanism that would appeal to his fancy—the faithless "gas-hound" would be touched with repentance and mend his punctured conduct. Of course it was a perfectly chimerical idea, because the only result of touching a chauffeur is to make him leave you and go jumping off over the landscape looking for another car-owner who is sane and normal, and will stand for the things he has to stand for. Still, the problem interested me by its very difficulty. You know, if you have a certain amount of success in dealing with relatively simple things like high-frequency currents, you get sort of cocky, and feel like tackling a really complex and baffling job like putting something over on a chauffeur. So I took the matter under advisement.

Falling into the glassy-eyed and muttering condition common to inventors, my reflections were about as follows: "H-m, recording-thing got to move whenever car's going. What'll move it? Can't use gas-explosions, spark-discharges, rotation of wheels; 'William' put kibosh; must be concealed from 'William.' What other motive-power inseparable from car in motion? Aha, rush of air! Nix. 'William' spot anemometer, stick match in works. Oh, hum. What? Say, that's the system—the joggle! Some joggle always present, even on smoothest roads. Pervades every part of car. Hidden joggle-recorder what's wanted. A 'jogometer'—how's that?"

Fig. 1 shows the *recording jogometer* complete. It's an auto-clock in a locked box of strong "William"-resisting material (3-inch armor plate will do) attached immovably inside the tonneau, or caboose, or whatever you call that part of the car where the passengers sit. The clock has no hands, but the hour-arbor is adapted to carry a paper dial, printed with time-divisions, which can be changed by unscrewing the nut N. The hand-gears must be altered so that the dial will revolve once in 24 hours instead of the usual 12.

Poised over the dial is the weight WT, attached to the end of a thin flat spring, free to vibrate between the dial and the stop placed just above. The lower side of the weight is sharpened off into a point, which embosses the paper dial as the weight drums upon it under the influence of the car's vibration.

Now then, let's conduct "William" thru a sample day, and see how it works. Look at the short line of dots "A" between 8.15 and 9 a. m. That's "Marbleback" riding down to his office on a bright sunny morning, full of hope and "pep."

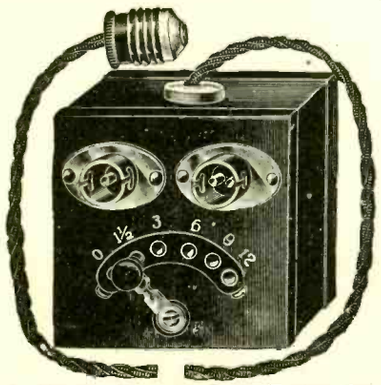


"B," from 11 to 2, shows Mrs. Marbleback shopping among the stores and beauty-parlors, flitting like a bee from flower to flower, so busily that the line appears continuous, and releasing with each fairy touch a little bill, which wings its way toward "Marbleback's" office.

At 2 o'clock ("C") she goes to the matinee, and the car is quiet till 4.30 ("D"), when she takes a turn around the park to see if any fashions have escaped her, calls for "Marbleback," and brings him home before he can "contract" any poker-games or leg-show stare, arriving at 5.30.

Now sound the "creepy music," for here is where the sleuthing starts. On the day in question, the "Marblebacks" past the evening at home, and from the point "D" onward, the record should have been a blank. But what do we see? the telltale arcs "D," "E," "F," "G," and "H," which betray "William's" nocturnal society life! Naughty, naughty "William," we are onto you! At "D," after an hour in the garage to make sure of dismissal, you were riding home to supper. Snatching a hasty meal, you hied yourself at 7.30 ("E") to the home of your blonde enchantress—Sadie Spasm, coffee-pusher and near-movie-queen. But from 8.45 onward ("F") whither, oh whither tends this hour's continuous journey, while Sadie leans back on the silken cushions, with all the inside lights lit, rehearsing "Theda Bara" on her way to the Duke's warehouse after another keg of pearl necklaces? Whither, prithee, but to the Rat's-Nest Inn, hospitable home of the joyous jazz, 40 short miles adown the pike. That blank till 1 a. m. means soup on the tablecloth at Childs' tomorrow, "William," beans for the gent who ordered "ham and," and for you a "head," a grouch, and perchance the can; but what boots it when youth and beauty drive? At "G" the relentless *jogometer* pictures "Theda" returning with the keg and "William" with the jag, and at "H" the car garage-ward plods its weary way. Selah!

A Button-Hole Flashlight



One of the latest innovations in the always convenient and invaluable electric flashlight is the one here illustrated, which fits in your coat lapel. A patent was recently issued to Mr. Edwin Frank Thomas of Meriden, Conn., on this extremely small model flashlight, which operates on a specially built and very compact style of dry battery. The casing holding the battery is fitted with a lapel pin of the same form as that used on brooches and other jewelry, enabling the wearer to easily attach the flashlight to the coal lapel or other garment. The lamp is turned on and off when desired by a simple turning of the switch button fitted in the bottom of the battery casing. The battery is a two-cell unit, and current is carried to the miniature incandescent lamp thru the supporting wires in the manner apparent.

Try These on Your Auto

AUTO BULB-TESTING DEVICE.

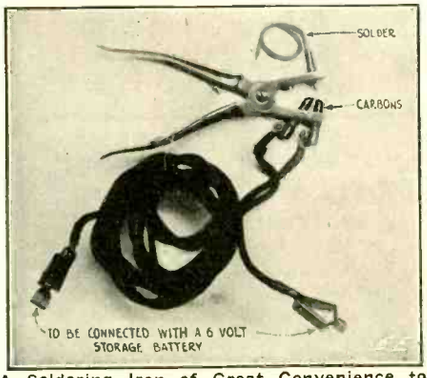
A new electrical automobile lamp-testing device is here shown. The tester is designed for all sizes of auto electric lights

A Handy Electric Bulb Tester for Private or Dealer's Use.

fitted with Ediswan bases. When a dealer sells an electric light bulb, he can test it before the customer's eyes, showing that the bulb is good and obviating any dispute afterward when the purchaser puts it in his car and happens to burn out the bulb thru some fault of his own.

PUSH THE BUTTON AND GET YOUR "GAS."

In the accompanying illustration an electrically operated outfit is shown which is intended for use in garages and service stations for pumping gasoline. This outfit is electrically operated, and is controlled by a push-button switch. The electrical control is arranged so that when the push-button is deprest, the pump continuously discharges gasoline at the rate of 25 gallons a minute, or may be reduced to a mere drip. When the button is released, the pumping stops automatically. The rate of flow is regulated by a speed control handle. The electric motor provided is enclosed in a strong iron case which is impervious to moisture or gases, permitting the outfit to be located out of doors. A large filter is built into the outfit to remove water and foreign matter which may be in the gasoline.



I Want 5 Gallons of "Gas." Alright, Deposit Your Coin, Push the Button and Get Your Gas.

A NOVEL 6-VOLT SOLDERING TOOL

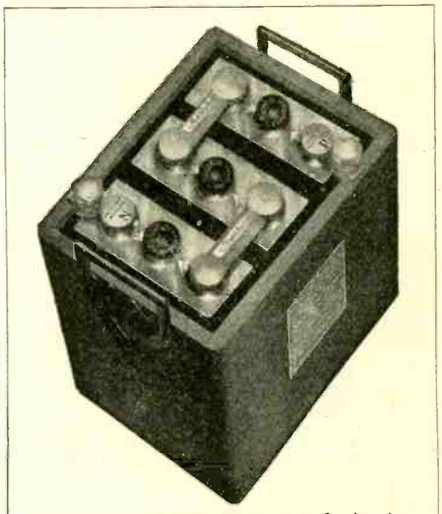
This new soldering tool, which has recently been patented, embodies some features never before employed in an electric soldering device, its inventor claims. The one shown in the photograph is made to be attached to a 6-volt storage battery. It can even be attached to the storage battery in an automobile, or on ordinary lighting voltages in connection with a step-down transformer.

All of the heat is applied at the exact point where it is needed, and just for the instant needed, so it does not require one-tenth of the electrical energy that is used by other soldering irons of equal capacity. One of the features which appeals to the user is that it is always ready for instant use; no waiting to heat up the tool before it can be used. Wire can be soldered together in less than 10 seconds; it is not only soldered but sweated right in.

A Soldering Iron of Great Convenience to Autoists. It Works on a 6 Volt Storage Battery.

This soldering tool is light and simple in construction and the solder is always ready for instant use, as it is carried in the tool.

YOU CAN LOOK RIGHT INTO THIS BATTERY



No one would think of buying or living in a light-tight, windowless house. Windows in a storage battery are just as essential. Every battery user will easily recognize the importance of knowing the exact condition of his plates and separators and the quantity of electrolyte in the battery at any moment. This great improvement in storage battery design makes it possible to know always what is going on inside your battery.

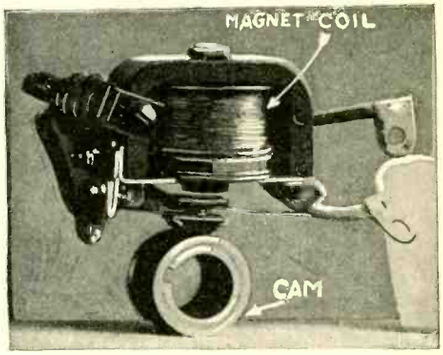
In the ordinary storage battery each cell has a hard rubber cover, and when the cells are sealed into their case the only possible view of the interior is thru the small vent hole in the cover. No satisfactory index to the condition of the vital parts can be obtained in this limited way.

The new storage battery here illustrated has a strong transparent cover on each cell. This window is actually stronger than the hard rubber used on other batteries, so there is even less danger of breakage. It is not affected by acid, and the tops and connections can be more readily kept clean and free from corrosion.

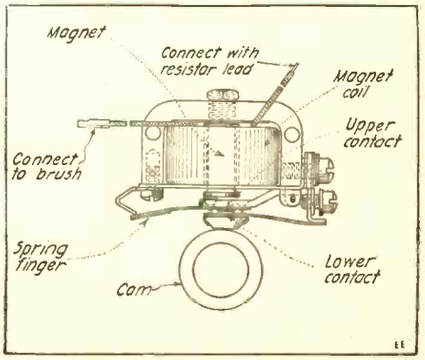
The solution, or electrolyte, in a storage battery must always be kept about ¼ inch (but no more) above the tops of the plates. Under no circumstances should the plates be allowed to project above the liquid.

Peep thru the window in this battery and

How High Is the Electrolyte? Look in the Window and See.



two red arrows will be seen projecting inward from the terminal posts. These indicate the exact level to which the electrolyte should rise in the cell.



A NEW CAM REGULATOR FOR AUTO DYNAMOS.

By William H. Easton.

Every automobile electric generator must have some means for keeping its voltage fairly constant under all normal operating conditions. Without such a device, the voltage would vary with every change in the speed of the engine and every alteration in the load of the generator and the current generated would be useless for either lighting or battery charging.

The Mystery of Atmospheric Electricity

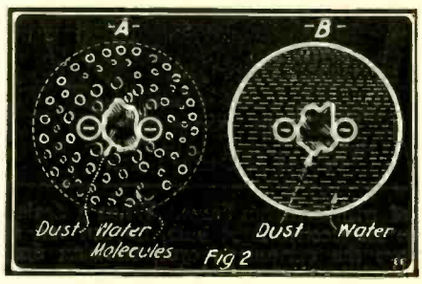
By ROGERS D. RUSK, M. A.
Late of the Meteorological Section, U. S. Army Signal Corps.

The Physics of Nature's Electricity Simply Explained

THE air is in a continual state of electrification because it contains at all times small particles charged with electricity. Even the scientists themselves do not know just what these particles consist of because they are different from the electrified particles found anywhere else. We are seldom aware of the existence of these particles because of their very small size and due to the further fact that all bodies at or near the surface of the earth *are at practically the same potential as the earth.* However, if all the electricity in the air could be collected for use at one time, there would be more, by far, than we would know what to do with. Benjamin Franklin startled the scientists of his day by bringing lightning down on a kite string, but we can go him one better today.

This Curve Shows Clearly How the "Intermediate" Ions of the Air Change Their Velocity Like Magic at 15 Millimeters Vapor Pressure, and Become "Large" Ions. An Interesting Discussion on This Phenomena Is Here Presented.

ELECTRICITY OUT OF A CLEAR SKY.



Even on the clearest day, if we send a kite up a few thousand feet, a distinct difference of potential can be noticed between the ends of the kite wire, often enough to give a severe shock. The cause of this electrification has been the subject of much discussion, but the biggest problem is to find just what these minute charged particles consist of.

Ions or small particles charged with electricity can easily be produced in most any gas by means of an electrical discharge or by the influence of X-rays or radium, but the ions found in the air are different from these; in fact, they are different from those found anywhere else, hence it is that they present a puzzling problem to the scientist. In general there are three types of ions which are found in the atmosphere called the *large, small and intermediate.* The small ones which have been known to exist for a long time are the same as those produced in any gas by the means above mentioned. When either an electric discharge, X-rays or radium rays causes an electron or element of electricity to be detached from an atom or molecule to which it belongs, then it leaves that atom or molecule charged with the same amount of electricity of the *opposite* sign, and the charged particle is called an *ion.* Sometimes these particles group themselves together, thus forming ions of larger size. Instead of these, however, there are still larger ions found in the air which could hardly be formed from even large groups of small ions, for reasons to be mentioned later.

The larger ions of the air and the intermediate ones are closely related and are the ones which so far are puzzling the scientists. Aitken, whose work along this line is justly famous, believes that the larger ions of the air are not aggregations of smaller ions, because when the smaller ions are formed by radium in a dust-free gas, the larger ions never appear. For this reason he believes the larger ions are really *dust particles* which have caught a charge of electricity. The word dust, however, is a convenient word to cover up our ignorance of just what the large ions actually are. In fact, they exhibit some properties which make them very interesting, and which show that they are far from being simple particles of dust.

WHAT ARE ATMOSPHERIC "DUST" PARTICLES?

These *dust particles,* if they are such, must not be confused with ordinary wind dust particles such as those blown up from a street. They are much finer and smaller, so much so in fact that they are capable of remaining suspended in the air for a very long time. Such particles are too small to be detected by ordinary means of observation and they can best be observed and counted by the famous *cloud method.* This method is to take a sample of the air and put it under reduced pressure which allows it to expand until the moisture in the air begins to collect around the *dust nuclei,* making them visible. In determining the relative size of the original particles another method must be used, and that is to compare their *mobilities. The mobility of an ion is its rate of motion in an electric field of one volt per centimeter, and is a measure of its mass.* The larger the mass the slower the particle will move under the given force.

A.—An Intermediate Air Ion Consisting of Negatively Charged "Dust Particle" Surrounded by Dense Atmosphere of Water Molecules.
B.—A Large Ion Formed by Water Vapor Condensing to a Liquid About the "Dust Particle."

By this method the larger ions are found to be *over a thousand times larger than the small ions and the intermediate ions about half way between.* It is argued that if these were *dust particles* only, then all sizes would be found instead of *three* distinct types. Recent discoveries tend to show there is something more than dust and electricity in the large ions and that it is this something else which causes the formation of the large ions which are not found anywhere else. It is all due to the discovery, a few years ago, that water vapor may condense in two ways on a rigid surface under certain conditions. Either it may condense in the ordinary way as a pure liquid, or it may condense more slowly and form a very dense atmosphere of separate water molecules about half way between a gas and a liquid, which will suddenly change to a liquid with an increase of the vapor pressure.

Now the significant thing is that if the mobilities of the ions are measured carefully while the pressure of the water vapor in the gas is being increased, a point is reached where the intermediate ions suddenly begin to move slowly like the large ions as shown in Fig. I, and this has suggested to J. A. Pollock and others the following explanation: The larger ions and the intermediate ones are formed of minute, rigid dust-like particles about which a small amount of water vapor has already started to condense. About some of these

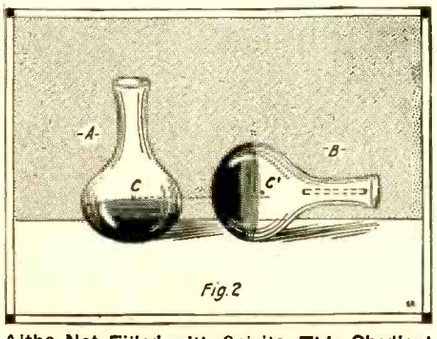
Experiments in Physics

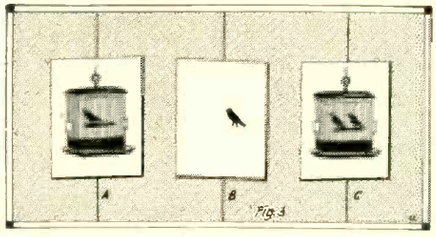
By JOHN J. FURIA, A. M.
DEPARTMENT OF PHYSICS, N. Y. UNIVERSITY



2--Illusions

PRACTICALLY all of the so-called "illusions" that are brought before the public, whether on the stage, at private entertainments, or sometimes in swindles, are based on fundamentals of physics. Hence it is fitting in a series of articles on "Experiments in Physics" to deal with this topic. Illusions may be divided into four classes: (1) Optical, (2) mechanical, (3) chemical, and (4) slight-of-hand. The first two types are of especial interest to us from the standpoint of pure physics.

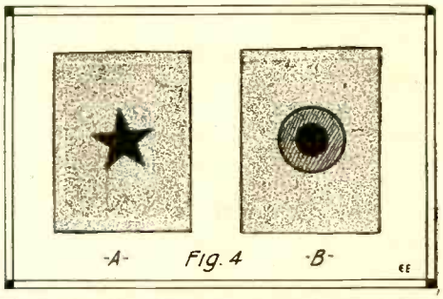
The "Obedient Ball" and How It Is Made from a Wooden Crochet Ball Hollowed Out as Shown. In This Space Are Placed Two Small Silk Spools with Strings Attached. The Ball Rises or Falls on the String at Command.



Perhaps the most mysterious of the magician's tricks, and one which appeals to all boys, is the *obedient ball.* All ball players appreciate the value of an obedient ball, especially the kind of ball that will "come to papa." As usually presented to the public from the stage the magician passes a piece of string thru the center of a good sized wood ball and then holds the string vertical. At his command the ball slides up the string, down the string, or else remains stationary. The *obedient ball* can be easily made at practically no cost. Divide a crochet ball in half by the use of a very fine saw. Carve out enough of the insides so as to have enough room for two small silk spools to revolve freely, see figure (1) A. The spools are glued together and fastened to the inside of the crochet ball by a dowel rod used as an axle. String is wound around each of the spools and the ends led out thru holes at the end of a diameter of the ball, perpendicular to the axle. The ball is glued together, sandpapered, stained and shellacked, and if a good job is made of it no one will suspect that the ball has been cut open.

Altho Not Filled with Spirits, This Obedient Bottle Will Lie Down and Stay Down Only for Its Master—the Magician. How Does It Work? Read on!

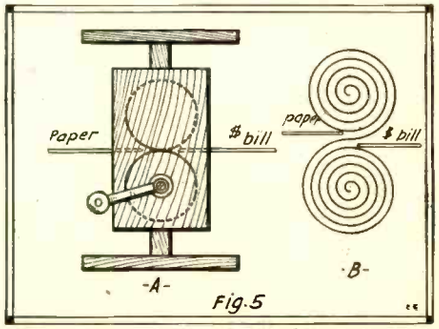
Figure (1) B explains why the ball will rise, fall or stand perfectly still. If the string is held loosely, the ball will fall, due to the pull of *gravity* on it. As force is applied to the ends of the string, gradually a point will be reached where the force of gravity is just overcome by the advantage gained by pulling the upper string (since the diameter of the spool to which the upper string is attached is larger than the diameter of the spool to which the lower string is attached). Greater force will cause the ball to move upward. It should be noticed that as one spool winds the other unwinds in each of the cases where the ball rises or falls. Hence the total length of the string in view changes according to the difference in the diameters of the spools. It remains for the performer to detract the attention of his audience away from this fact. The illusion is one of pure physics, more particularly mechanics. The equation for the motion may be written as follows:



Let g represent the force of gravity, f the force applied to the string by the performer, and D and d, respectively, the diameters of the spools. $Df - d(g + f)$ causes the motion. When f is zero (when the performer holds the string loosely) the tendency to move upward (Df) is zero and tendency to move downward is dg, and the ball moves downward. When f is such that $Df = d(g + f)$, the tendency to move upward equals that to move downward,

If Two Cards Are Drawn to Resemble Figures A and B, Placed Back to Back on a Cord and Then Spun Rapidly, Two Birds Will Appear in the Cage, as at C.

and the ball remains stationary. When f is large enough so that Df is greater than $d(g + f)$, the tendency to move upward is greater than that to move downward, and the ball moves upward.



Speaking of the *obedient ball,* the event of July 1st (last) leads us naturally to the *obedient bottle.* A small wood bottle (empty since July 1st) of the shape indicated in figure (2) A, is placed on the table and told to "lie down—and stay down," and the bottle does so. (Nothing remarkable.) The performer then picks up the bottle and passes it around, defying anyone else to cause it to "lie down—and stay down"! No one is able to do so. The performer then takes the bottle again, coaxes it and causes it to lie down as before. This is another case of pure physics, more particularly mechanics. The bottle is weighted with lead as shown in figure (2) A, so that its center of gravity C is very low. It is seen from figure B, that placing the bottle on its side causes the center of gravity to be raised to the position c'. It is well known in mechanics that a body is in stable equilibrium (will return to the same position when displaced) when its center of gravity is at its lowest. Hence it follows that the bottle will always return to its stable equilibrium position (standing up). How, then, does the performer cause it to lie down. He keeps concealed up his sleeve or "palmed" a long narrow weight which he slips into the neck of the bottle whenever he wishes it to lie down. The addition of this long narrow weight causes the center of gravity for the upright position of the bottle to be high, so that placing the bottle on its side causes the center of gravity to be lowered; hence this will now be the position of stable equilibrium. In picking up the bottle before passing it to the audience for examination, the performer allows the weight to drop back into his hand again.

An Interesting Illusion Experiment Based on the Persistence of Vision. A Black Star Drawn on a Blank Card, When Spun Rapidly, Will Change Into Two Circles—One Gray and One Black.

In order not to disappoint those accustomed to "seeing double," the following is inserted for trial any time after July 1st. Draw a bird in a cage on one side of a blank card. On the *reverse* side draw another bird. Attach a piece of thread to the top and bottom of the card and twirl the card about this thread as an axis. TWO *birds will be seen in the cage.* Many variations of this illusion can be tried. The cage alone on one side and the bird on the other; a glass of "Bevo" on one side and an open mouth on the other, etc., etc. The result obtained is due to physiological rather than physical reasons. The phenomenon is known as *persistence of vision.* The retina of the eye retains any image thrown upon it for a moment after the object has been removed. Hence when

Cleaning and Washing Agents
Part II

WATER and a few other solvents are commonly used to remove dirt, sometimes called "matter out of place." Some of these substances readily dissolve in water; others like the fats, will dissolve in ether

Fig. 1

Showing the Simple Apparatus Required to Perform Experiment No. 1. A Bunsen Burner, a Beaker, Tripod, Gauze and Heating Dish.

or gasoline; and still others, for instance the resins, will dissolve in alcohol. Some form of alkali, such as wood ashes, was formerly used with the water, to assist in removing the dirt. This, it was discovered, possest a very destructive action upon the goods, so a *saponified* fat, the product produced by the action of an alkali on a fat, or what we now call *soap,* came into universal use. This, as is well known, when made of good materials will not injure the goods. Soap was used instead of lye from the lixiviation of ashes, long before the chemistry of the process became known. It was not until 1813 that Chevreul publisht his scientific researches on the composition of fats and the processes of soap-making.

Manufacture of Soaps.

The raw materials used in the manufacture of soap are an alkali known as *caustic alkali,* which may be either sodium or potassium hydroxid. The sodium hydroxid will produce a hard soap, while the potassium hydroxid produces a soft soap. These are made by boiling the carbonat with slaked lime, following out the equation

Sodium Carbonat + Calcium Hydroxid = Calcium Carbonat + Sodium Hydroxid.

From this mixture the calcium carbonat settles out, and the solution of the caustic alkali is boiled down to a solid, and is put upon the market under the name of *concentrated lye,* or the concentrated solution is used directly by the soap-maker.

Recently the caustic soda has been made directly by the electrolysis of sodium chlorid. The sodium deposited at one pole is dissolved in water, and the chlorin is used for making bleaching powder.

The second ingredient of a soap is either a vegetable or animal fat or oil, or a resin. Such oils as that of the palm nut, cocoanut,

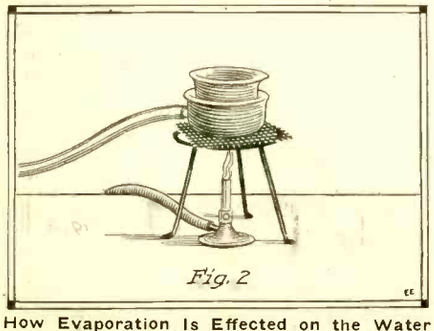

Fig. 2

How Evaporation Is Effected on the Water Bath of the Solution Obtained from Experiment No. 1. Apparatus Shown Is Used in Experiment No. 2.

olive, hemp seed, linseed, cotton seed, fish or lard may be used, and fats like beef tallow, mutton tallow, lard, or house grease.

The process of *saponification* may be occasioned either by the action of water or steam at high temperatures and pressure (especially in the presence of a dilute mineral acid), by the action of caustic alkalies, or sometimes by the use of lime. The fats may be briefly described as consisting of ethers of the triatomic alcohol-radical, containing *glycyl.* By treatment with alkalies or high-pressure steam, they yield *glycyl alcohol* (glycerin) and stearic or other fatty acid. The name given to the compound of the acid and glycerin is *stearin, palmitin,* or *olein.* In the case of stearin, the equation representing the saponification would be:

$$\underset{\text{Stearin}}{C_3H_5(C_{18}H_{35}O_2)_3} + \underset{\substack{\text{Caustic}\\\text{Potash}}}{3KOH} = \underset{\text{Glycerin}}{C_3H_5(OH)_3} + \underset{\text{Soap}}{3KC_{18}H_{25}O_2}$$

With palmitin or olein, the reaction is similar. If the fat or oil is solid, it contains a preponderance of stearin or palmitin, but if liquid, there is an excess of olein.

In making soap on a large scale, a kettle, provided with both a closed and open steam coil, so that the soap may be boiled either by the heat or the free steam, is used. A

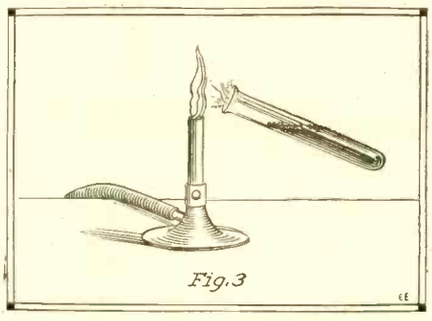

Fig. 3

Applying the "Sodium Test" in the Flame of a Bunsen Burner. Experiment No. 4.

kettle that will hold 100,000 pounds of soap is 15 feet in diameter and 21 feet high, and is made of ⅜ inch boiler plate. The melted fat and lye are run into the kettle and mixed by the aid of free steam and boiled for some time, or until the soap has a dry, firm feel between the fingers; it is then *salted out* by adding common salt. In boiling, the saponification represented in the above equation has taken place, and when the salt is added this causes the soap to separate from the caustic lye and glycerin. After boiling, to mix thoroly, the mass is permitted to stand in the kettle till the soap rises to the top, and then the lye may be drawn off at the bottom of the kettle. Some more strong lye is then added, and the boiling is continued till the material is fully saponified, which the experienced soap boiler knows by sight. feel, and taste, and then the content of the kettle is again allowed to stand for a while, and the additional lye is drawn off. The soap is then boiled with some water, and is permitted to settle again, to allow the separation of more alkali, dirt and impurities, called *nigre.* After standing several days, the soap is pumped into the *crutcher* which consists of a broad, vertical screw working within a cylinder, which is placed in a larger tank. Here it is thoroly mixed, and any perfume or scouring material may be added. The soap is then drawn off into rectangular *frames,* holding about 1000 pounds where it is allowed to solidify. The sides of these frames are removed and the

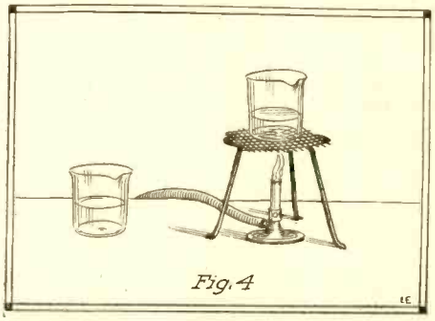

Fig. 4

Simple Apparatus Used in the Preparation of "Prussian Blue," as Described in Experiment No. 5.

soap is cut, by means of wire, into slabs and then into bars. If put on the market in the form of cakes, the bars are prest into the desired shape.

For making white soaps, tallow, palm oil, and cocoanut oil are used. Castile soap, if genuine, is made from olive oil, sometimes with the addition of cocoanut or rape seed oil. It is useless to attempt to make a good soap out of an inferior material. In making lower grades of soaps, cheaper fats are used, and frequently those that have a rancid odor. This is sometimes *corrected* by the addition of a strong perfume, like oil of *mirbane,*—nitrobenzine, made from coal tar. Yellow soaps almost always contain considerable rosin; that is they are made by the usual process, except that quite a large proportion of rosin replaces the fat. This has valuable soap-making qualities, and would not be classified as an adulterant of soap. Cocoanut oil saponifies without boiling, so it is used in making the *cold process* soap. This material also admits of the use of a larger quantity of water, so that the soap will be hard and still contain as much as 70 per cent of water. Soap is mottled by stirring into it, while warm, some coloring substance, such as copperas, ultramarin, or an anilin color.

Sand soap, pumice stone, and compounds of a similar character are made by incorporating sand or powdered pumice, with the ground soap, and this ought to lessen the price of the soap very materially. These substances can act only mechanically; that is they *sandpaper off the dirt.* A silicated soap is made by mixing with the ordinary soap some silicat of soda or

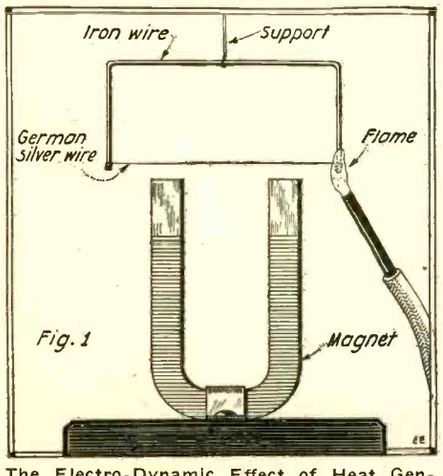
THE CONSTRUCTOR

Thermo-Electricity Experiments

By THOMAS W. BENSON

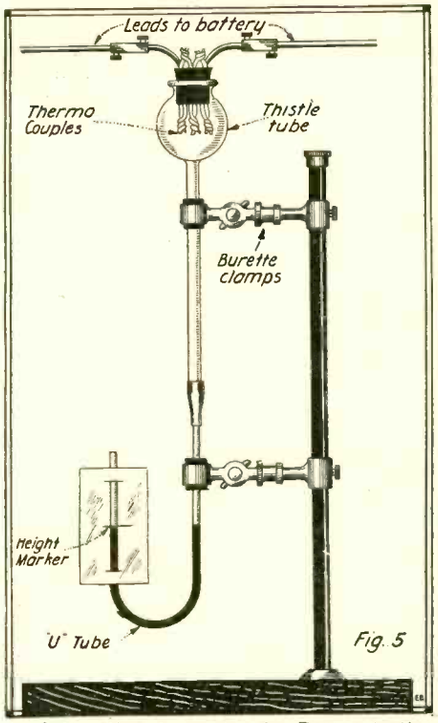
IT was first noted by Seebeck, of Berlin, that when a juncture of dissimilar metals was heated a current of electricity would flow. This phenomena was studied by Cumming, Sturgeon, Pellaci and many others, for it gave promise of providing a means for *developing electricity direct from heat, without the use of steam engines and generators.*

Altho no practical application has been made of the discovery, beyond its application to *pyrometry* for heat measurements, several interesting devices can be easily constructed to demonstrate the phenomena.



The most powerful currents are generated by heating junctures of the more crystalline metals, such as antimony and bismuth, the other metals lying between these in regard to the strength of the current generated with a given rise in temperature. The following list gives the thermo-electric order of the more common metals:

+Bismuth	Tin	Zinc
Platinum	Gold	Iron
Mercury	Silver	—Antimony
Lead	Copper	



Any two of these metals when joined together and the junction heated results in a current flowing thru the exterior circuit from the metal highest on the list to that lower. The *reverse* is true should the junction be cooled. The further apart the metals are in the table the greater will be the electromotive force.

It is seen that bismuth and antimony will give a so-called "couple" having the highest E.M.F. These are rather difficult to obtain and handle, so for experimental purposes we will substitute iron and German-silver wire. These two metals are employed in the construction of thermo-couples for electric pyrometers, and will serve our purpose admirably.

The electro-dynamic effect of *heat generated* currents can be shown by a device similar to that illustrated in Fig. 1. Three sides of the wire rectangle are composed

The Electro-Dynamic Effect of Heat Generated Currents Can Be Shown by the Simple Device Here Illustrated. An Iron and German Silver Wire Rectangle Is Suspended Above a Magnet. The Loop Turns When Heated.

An Interesting Apparatus for Demonstrating the "Peltier Effect," or the Production of "Cold" by Electricity.

of iron, the fourth of German-silver. The frame is suspended over a permanent magnet and heat applied to one corner as shown. The frame will turn thru an angle of 90° due to the currents flowing in the loop.

A large number of turns of wire could be made to form a *heat compass.* The details of such a device are shown in Fig. 2. A small bundle of soft iron wire is bound with paper glued into place. Take a number of lengths of iron and German-silver wire and wrap them in the same direction on the core, in alternate coils as shown. Twist the ends of the wire together so that every other joint is on top. The ends of the more distant coils being connected together by a loop of wire, thus forming a sling to support the compass.

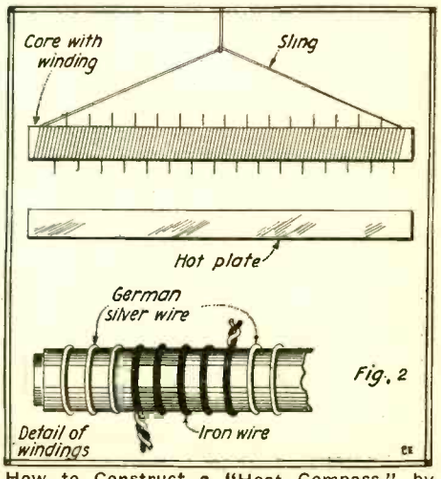
When this apparatus is suspended over a hot copper or brass plate, the currents flowing around the windings will cause it to act as a *compass* and the core will place its axis in a line with the natural magnetic field of the earth.

A form of *thermo-electric motor* can be constructed as shown in Fig. 3, to demonstrate electro-magnetic rotation. Here we have a ring of iron wire attached to which are a number of vertical German-silver wires, bent over at the top and joined at the center to a pivot. The latter rests in a tiny depression in the pole of a horseshoe magnet, allowing the cage to turn freely.

By applying a small flame to the frame at the juncture of the G.S. and iron wires between the legs of the magnet a current will flow thru the vertical wires and rotation will result from *magnetic repulsion.* The device will attain quite a high speed if carefully constructed.

A thermo-battery can be cheaply made that will deliver a fairly heavy current in the following manner: Take a 1" pine board 6" square and drill with small holes at the intersection of lines drawn in both directions ¼" apart. The board is then impregnated by placing in melted paraffin. Alternate 2" lengths of iron and G.S. wire are pushed into the holes and their ends tightly twisted together on both sides of the board, the end wires being led to binding posts.

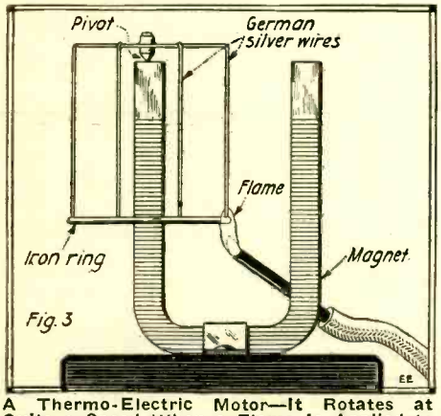
When the battery is stood with one side in the sun, the other being shaded, an appreciable E.M.F. will be generated. **If laid on a block of ice in the sun it will ring a vibrating bell!**



A somewhat similar form of *thermo-pile,* comprising antimony and bismuth bars, in the hands of Forbes and Milloni led to the beautiful discovery of the polarization of heat.

Andrews noted that a current was generated when platinum wires are inserted in a bead of fused borax, potassium chlorid, chlorids of potassium and strontium, iodid of potassium, sulfate of soda, and even when boracic acid is used. These results, however, are due to a *thermo-chemical* action and formed the basis for the work of Edison and others on the *heat cells.* The action differs from the *true* thermic action of dissimilar metals.

Conversely we have electro-thermic effects whereby heat and cold result from an electric current passing between dissimilar metals. The production of cold by this means is rather startling and is known as the *Peltier* effect.



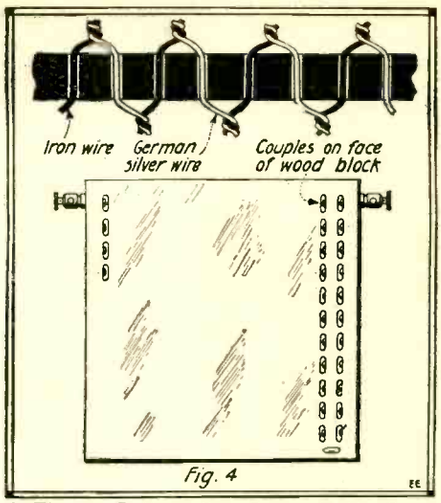
Apparatus to demonstrate the latter effect can be assembled as shown in Fig. 5. A large thistle tube has connected to its lower end a U-tube with a small bore, by means of a length of rubber tubing. The U-tube is partly filled with colored water.

A cork that fits the mouth of the thistle tube has six holes bored thru it into which

How to Construct a "Heat Compass," by Winding Turns of Iron and German Silver Wire About an Iron Wire Core. In Use It Is Suspended Above a Hot Brass Plate.

are inserted short lengths of iron and G.S. wire, about five strands of wire being put in each hole. These are twisted together to form thermo-couples and the cork inserted in the mouth of the thistle tube. A little paraffin wax melted over the cork will seal the whole effectively.

A Thermo-Electric Motor—It Rotates at Quite a Speed When a Flame Is Applied to the Armature, Made Up of Iron and German Silver Wires. A Most Interesting and Little Known Device.



When the positive and negative poles of a battery (gravity type preferred) are connected to the iron and G.S. wire respectively, the junctures inside the tube will drop in temperature and the air contracting will cause the water in the open leg of the U-tube to drop. For best results the current should be regulated by a rheostat so that it is not sufficient to heat the wire used in the couples.

A current having a fairly high E.M.F. and low amperage gives the best results.

The exact cause of the current generated in a thermo-couple is still an unsolved problem. It is not due to any oxidization or chemical effect for it has been found that a bar of the same metal with different temperature of its opposite ends will give a slight current, the cold portions becoming *negative*, the hot parts *positive*. A thoro understanding of the phenomena demands more complete knowledge of matter structure and the inter-atomic forces.

A fuller realization of the forces in action may revolutionize present methods of current generation and perhaps refrigeration.

Thus there is a very fine field open for experimentation by the industrious student. By experiment we learn many things heretofore undreamt of.

A Thermo-Battery Can Be Made U. Quite Cheaply by Mounting Iron-German Silver Wire Couples on a Board as Shown. Laid on a Block of Ice in the Sun, It Will Ring a Bell.

A "Selective" Electrolier Switch

By Albert H. Beiler

The writer recently tried to make an electrolier switch which could control from one to five lamps. The lamps were on a chandelier and it was undesirable to turn each lamp on or off at its socket. They were placed on the chandelier as shown in Fig. 1. Owing to the fact that it was desired to make the lamps light in a symmetrical arrangement, it was not necessary to control each lamp singly, but merely to get a switch which could light one. two, three, four or five in a *symmetrical order*.

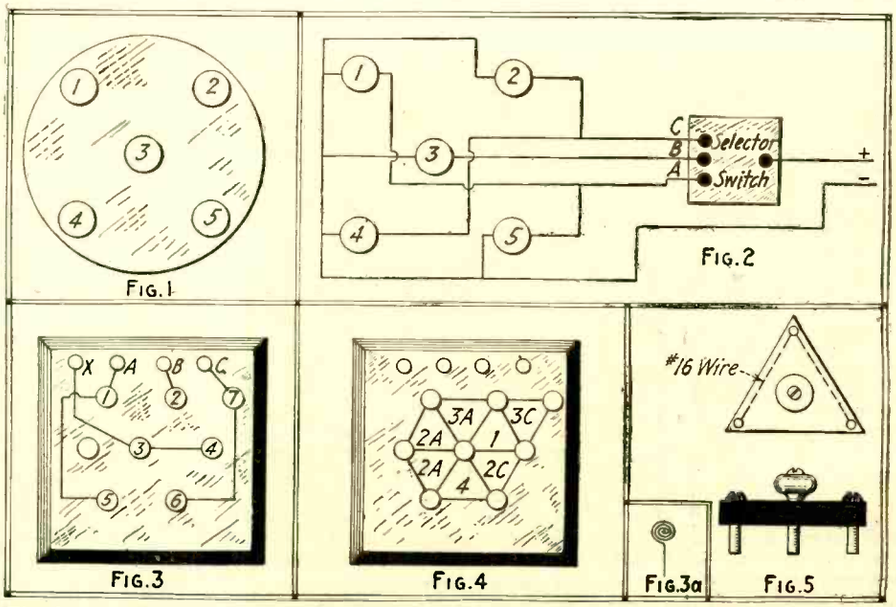
Number of Lamps	Number of Each Lamp	Control Circuit
1	3	B
2	1, 5	A
	2, 4	C
3	1, 3, 5	A, B
	2, 3, 4	B, C
4	1, 2, 4, 5	A, C
5	1, 2, 3, 4, 5	A, B, C

For example, if two were desired, it would not look well to light one and four, or two and three, but a combination like one and five, or two and four would do nicely. Accordingly, the wiring to the lamps was arranged as shown in Fig. 2. With this wiring the circuits would have to be controlled as summarized in the table above.

There is thus a common wire going directly from one main to one terminal of each lamp and three control wires which go to the *selector switch*. This switch is constructed as described below.

Secure a piece of hard wood 5 x 5 x ⅞ inches. Lay out a hexagon of 3 inches diameter, as shown in Fig. 4. Drill ⅜-inch holes at the eight points indicated about ¼ inch deep. The seven numbered holes should have small holes go clear thru the wood and just large enough to permit a No. 14 wire to pass thru (No. 50 drill). The unnumbered hole is a blank whose purpose will become apparent later. Twist some bare No. 14 wire into little spirals, as shown at 3A, and put one in each of the seven numbered holes so that the end passes out thru the bottom. Then stop up the small holes where the wires protrude with sealing wax, so that each ⅜-inch hole is a sort of liquid-tight cup with a conductor lying along its bottom. The wiring is shown in Fig. 3 running to four binding posts, which had best be labeled as indicated in India ink to avoid confusion later. The base may now be chamfered and stained to make it look well. The holes should then be connected by the lines shown and the triangle so formed should be labeled as indicated in Fig. 4.

The bridging arms should now be made. These are two triangular pieces of ⅜-inch fiber or hard rubber, the triangles measuring 2 inches on a side (Fig. 5). The holes are drilled ¼ inch from each vertex, and are tapt to receive 8-32 machine screws. A ⅞-inch machine screw is put into each hole at a vertex. These three screws are then connected to each other by No. 16 wire twisted around each and neatly forced into grooves, scratched into the fiber for the purpose by a sharp awl or scriber. A small porcelain knob is fastened to each triangle by a washer and screw fitting into the center hole.



If the triangles are constructed properly each will fit into any three holes at the vertices of an equilateral triangle in the baseboard. The numbered holes should then be filled with mercury to about 3/16 inch from the top. Binding posts A, B and C are connected to control wires A, B and C, and the common wires goes to the other side of the main (Fig. 2).

It is obvious then that any combination noted in the table may be obtained by covering the triangle whose number indicates the number of lights to be lit. For example, to light *four* lamps, one of the triangles is placed in holes 3, 5, 6, so as to cover triangle No. 4, etc. Up to and including four lamps, only one triangle need be used, but for five a combination like 2A and 3C or 4 and 3C is needed, requiring two triangles.

The arc formed when a triangle is lifted out is inappreciable, being broken simultaneously at two places. Should it be desired, however, to break a circuit carrying more than about 5 amperes, it will be better to construct a base of fiber.

This switch may be made at a cost of about 25c, whereas an electrolier switch of commercial manufacture to satisfy this wiring costs upwards of $4.00.

Many modifications of this novel switch can be worked out with a little ingenuity on the part of the builder. This switch lends itself well to many laboratory circuit requirements.

The Construction of a Selective Chandelier Switch for Turning on or off Various Combinations of Lamps, Is Here Described by Mr. Beiler. Special Arrangements for Larger Groups of Lamps Can Be Worked Out Easily.

Making a Machine for Telegraphing Pictures

Part I

By LE ROY J. LEISHMAN

Expert In Telephotography

IT is a very simple matter to *telegraph pictures.* A crude machine for this purpose was suggested seventy years ago. The idea is therefore not entirely new to students of electricity, but the science has been so neglected that it is still nebulous to the average person.

How little the general public knows of *telephotography* is shown by the fact that when two of my machines were exhibited on the Orpheum and Pantage's vaudeville circuits two years ago, the demonstration was fascinating, baffling and uncanny to the audiences everywhere. Even most of the newspapers had never heard of such a thing before.

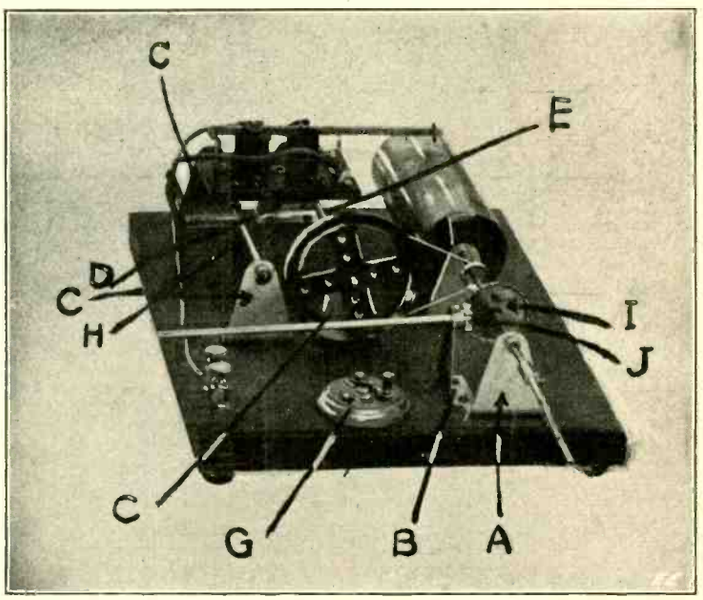
A person with an electric picture transmission machine may therefore entertain and baffle his friends and townspeople, besides conducting a great deal of experimenting which will be instructive and highly beneficial to himself.

By the time this article appears, popular interest in telephotography will be heightened by the use of telegraphed pictures by many of America's leading newspapers. Several papers have already publisht "news pictures" periodically, *and pictures have been telegraphed across the continent at regular intervals and displayed on bulletins.* The practicability of the scheme is shown by the fact that excellent pictures have been transmitted 4,856 miles! Many newspapers have recently subscribed for a service that will supply one hundred and fifty news pictures a year, *making it possible for them to publish a picture of an event the day it happens, regardless of geographical location or distance!*

So the person with the necessary apparatus to telegraph pictures will find himself the center of interest everywhere.

It has often seemed puzzling to me why more electrical students have not experimented with telephotography. Many letters which I have received lead me to believe it may be due to a popular misconception that such experiments are too costly. I therefore recently designed some *Picture Telegraphing Instruments* which are low-priced enough to suit every experimenter who may be interested. To further interest the readers of this magazine in this fascinating and instructive field, I am explaining in this article how a simple telephotographic set can easily be made. However, the chief fascination and instruction is in the operation of the finished machines and in the various experiments that can be made with them.

No exact dimensions will be given for any of the various parts, as the material at one's disposal sometimes makes it advisable to change some of them; and then the others must be altered accordingly.



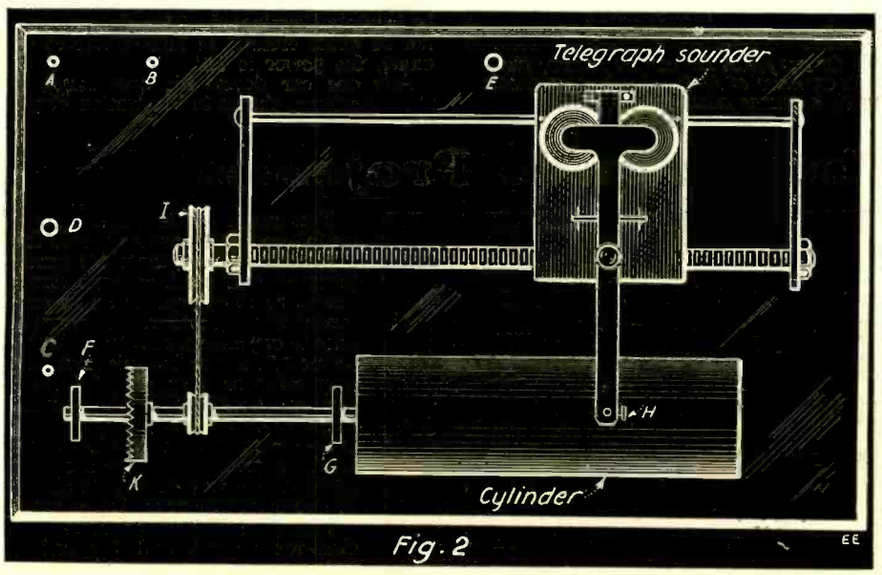


Fig. 1.—The Telephotographic Machine Here Described. It Opens up a New Era in Scientific Experiments for the Electro-mechanical Student and Provides a Stepping Stone to this Newest Branch of Applied Science.

GENERAL DESIGN FEATURES OF APPARATUS

Let us first get an idea of the general appearance of the device we are going to make. A glance at figures 1 and 2 will show that the machine resembles very much an old style cylinder phonograph. The cylinder of the picture transmitting machine holds the pictures to be telegraphed in the same manner that the phonograph cylinder holds the record to be played. The sending and receiving carriage corresponds with the phonograph reproducer, and it passes slowly from one end of the cylinder to the other on a threaded shaft as the cylinder revolves. In this manner the carriage needle finally touches every part of the picture. The threaded shaft on which the carriage travels *must* be absolutely parallel to the cylinder. The reproducer on a cylinder phonograph has a half nut that rests against the threaded shaft, so that the reproducer may be lifted up and moved to the other end of the cylinder. This necessitates another shaft, parallel to the threaded one, on which the reproducer pivots. A picture transmitting machine is similarly equipt.

Top View of Telephotographic Machine Here Described in Detail. The Parts Required in Building It Are Few and Simple, But Should Be Made with as Great an Accuracy as Possible.

The size of the complete apparatus depends upon the dimensions of the pictures to be telegraphed, as this determines the size of the cylinder; and the shafts and base must be proportioned accordingly. A convenient size for the picture is about 5 by 6 inches. As plenty of margin must be allowed, this necessitates a cylinder about 2 inches in diameter and 5½ inches or 6 inches long. Electrical contact must be made with the rolled copper plate which is slipt on the cylinder, so it is most convenient to make the cylinder from metal tubing. Ordinary pipe will not do, as the cylinder must be very true and perfectly uniform thruout. Brass or nickel-plated fixture tubing is excellent. A metal bar or disc must be soldered in each end, and holes *accurately drilled* in the *exact centers* to fit the shaft. As the cylinder is light and supports no great weight, the shaft may have a small diameter, so a rod can be selected for this purpose which will fit the gears available. Erector, Meccano or other rods are satisfactory, and can easily be fitted with gears which are obtainable in the regular sets or at any hardware store. The cylinder rod should be 3 or 4 inches longer than the cylinder and must be *perfectly straight.* Place it thru the holes in the cylinder ends and solder it so that one end is flush with one end of the cylinder.

After the cylinders have been made, the length of the base can be decided upon, as this dimension should exceed that from one end of the cylinder to the other end

Home-Made Compound Microscope

By Carl F. Muckenhoupt

A COMPOUND miscroscope is beyond the reach of many experimenters because of its prohibitive price. Since such an instrument is very useful, and desired by many experimenters, I describe below the theory of the microscope, and the method of building one cheaply.

Fig. 1 shows how the tiny object OP is enlarged by the objective at O'P', which image in turn is re-magnified by the eye-piece, and seen as at O"P". To avoid complexity, only the rays from the head of the little arrow are shown, but rays from the other end would pass symmetrically oppo-

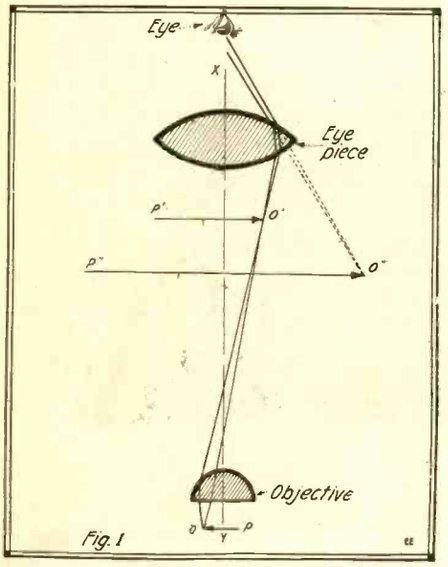

Fig. 1. This Diagram Shows the Path of the Focal Rays Thru the Optical or Lens System of the Home-Made Compound Microscope Here Described and Illustrated. The Eye-Piece Lens Shown Is a Double Convex One, While the Objective Lens Is of the Plane-Convex Type. Most Good Microscopes Have Two Lenses in the Eye-Piece.

site the main axis XY, and come to final focus at P", just as those shown focus at O". We see that by placing the object just outside the focus of the short-focus lens, an enlarged image is cast at some distance, which in turn is magnified by the eye lens. A good microscope has two lenses in the eye-piece, instead of one, to make a field free from chromatic and spherical aberration.

A good microscope is shown at Fig. 2. The tubes are preferably of thin sheet metal, rolled over a stick to the proper diameter, and then soldered. They may, however, be made of pasteboard. The main

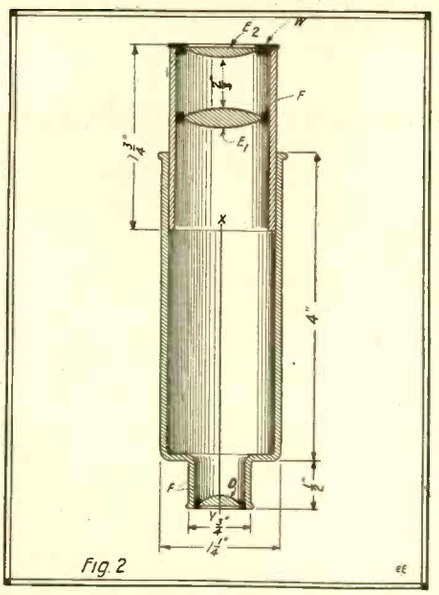

Fig. 2. This Sectional View of the Microscope Shows How the Metal Tubes of Brass, Copper, or Other Covering Are Arranged to Slide Within One Another; the Objective Lens Being Placed at O, and the Two Image-Magnifying Eye-Piece Lenses at E-1 and E-2.

tube is 4 inches long by 1¼ inches in diameter. A ring is soldered to its bottom end, with a ¾ inch hole in it. In this, in turn, the little objective tube, ½ inch long by ¾ inch diameter, is soldered. Make sure everything is well soldered, and then paint the inside of the whole affair a dull black, *not* shiny black. For the eye-piece, make a tube 1¾ inches long, and of a diameter to fit the main barrel snugly. This may take some time, for it must not work too tightly, or be too loose. Paint this black inside as well.

Power	Focal length of E_1 and E_2	Distance between E_1 and E_2	Distance between O and E_1
50	$2\frac{2}{3}$ inches	$1\frac{7}{3}$ inches	$6\frac{1}{3}$ inches
75	$1\frac{2}{3}$ inches	$1\frac{1}{3}$ inches	$5\frac{1}{3}$ inches
100	$1\frac{1}{4}$ inches	$\frac{5}{6}$ inch	$5\frac{1}{8}$ inches
130	$\frac{8}{3}$ inch	$\frac{9}{16}$ inch	$4\frac{7}{8}$ inches
		Note: For low powers the eye piece tube is very long	

Data for eye pieces for various powers; the letters are those of fig. 2. E_1 is always double, and E_2 is always plano convex.

The lenses naturally come next. O, the objective, is a ½ inch focal length, *plano-convex* lens. These can be secured from your optician. E_1 is a 1-inch focus, double convex lens. E_2 is a 1-inch focus, plano-convex lens. Take care to have these last two of the same kind of glass. O is mounted by making a ring to fit the bottom of the objective tube, and with a hole slightly smaller than the ½ inch focus lens. Center the lens over the aperture as shown, and glue a ring of felt F, with a hole smaller (slightly) than the lens, to the metal ring. When fast, clean the lens thoroly, and solder carefully to the little objective tube as shown by Fig. 2.

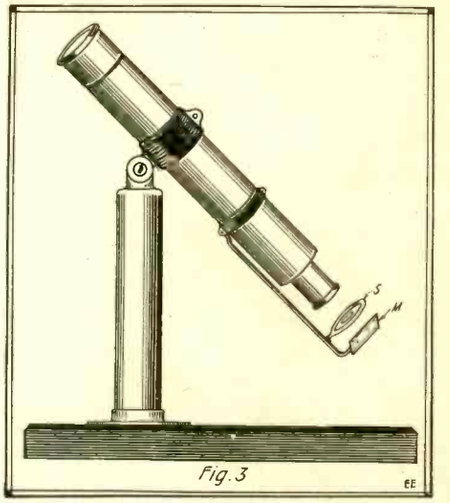

Fig. 3. A Simple Arrangement for the Home-Made Microscope Which May Be Modified and Improved by the Ingenuity of the Constructor, by Adding a Rack and Pinion or Other Precision Focusing Gear.

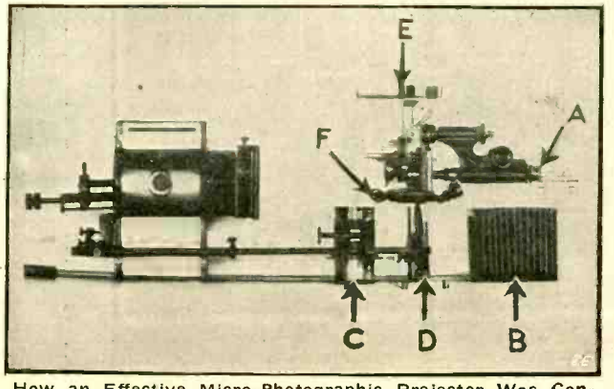

In one end of the eye-piece tube, fasten a ring of wood W, with a hole smaller than the plano 1 inch focus. Cut out the wood until the lens fits well, then screw a cap on the end with an aperture of about ½ inch. Mount E_1 2/3 of an inch from E_2, by forcing a ring in the tube, at right angles to it, and gluing felt around the lens. Push the eye-piece in until E_1 is about 4⅝ inches from O. This need not be exact unless you want to know the power exactly. The objective should be about 9/64 inch from object, which must be brightly illuminated. This distance need not be exact either. If both distances are exact, the power is 112.

Any one can devise his own stand, or use the scheme shown in illustration Fig. 3.

A Micro-Photographic Projector

The ease with which this apparatus is constructed is its main feature, provided, of course, one has the microscope and an ordinary projection lantern. I will proceed to the explanation of the letters in the picture.

Remove the entire front combination of lenses C, and the bellows, B. Bend the tube of the microscope, on the hinge provided, until it is at right angles to the foot E. Turn upside down and fasten to the front support D by two ordinary small wood clamps. Remove the eye-piece A, and you have a most excellent projector. It is much more satisfactory if one has a sub-stage condenser as shown in the photograph.

How an Effective Micro-Photographic Projector Was Constructed from a Stereopticon and a Microscope.

This unique arrangement of physical laboratory apparatus should find a great many uses, especially among lecturers and teachers, who find it necessary to enlarge or throw on a screen micro-photographic views of minute organisms, et cetera. Either an electric arc or incandescent lamp may serve as a source of light or else an acetylene light. Careful focusing of the complete apparatus is necessary to obtain a clear image on the screen. Drawings are often made in this way of minute objects by projecting them on white paper.

I have used this apparatus for class-room work and for making pictures of microscopic objects with fine satisfaction.

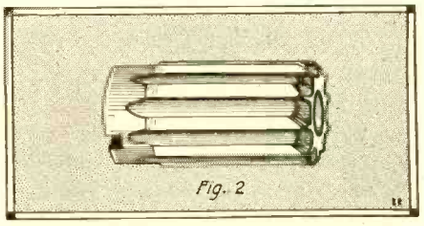
Experimental Mechanics

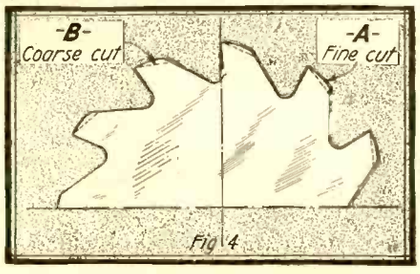
By SAMUEL D. COHEN



LESSON XIV

REAMERS CONTINUED.

IN order to save the material which would be used for the shank, the shell reamer having a hole thru its center by means of which it is mounted on the arbor, is largely used. By making the reamer in this manner *one* arbor can be utilized for a number of sizes. The general appearance of a shell reamer is illustrated in Fig. 1. This type is known as a *fluted shell* reamer. In Fig. 2 a *rose shell* reamer is shown. The cutting edges, fluting, and back taper of this latter type are the same as those of the rose reamers. However, in all other particulars, the tool is the same as an ordinary fluted shell reamer.



The Shell Reamer—This Form Is Widely Used in All Machine Shop Work. It Is Used on an Arbor.

A Typical Rose Shell Reamer. This Tool Has a Cutting Edge Provided on the End of Each Tooth as Shown.

The arbor used with the shell reamer is shown in Fig. 3, the shell reamer being provided with a keyway, which freely fits the key B. The reamer, when at work, is rotated by means of this key and keyway. The hole thru the reamer tapers, the taper being ⅛ inch per foot. Manufacturers of reamers have adopted certain standard sizes of arbors, and each arbor corresponds to a certain number of sizes of reamers; thus several sizes of reamers are provided with the same size hole, and can be used with the same arbor. The arbor as well as the hole in the reamer must be ground after hardening to insure the true running of the reamer. The outside of the reamer is provided with flutes and cutting edges for the greater part of the length. The short length at the end provided with a keyway, is turned down below the diameter of the cutting edges. This is done to prevent any burr which may be set up by the driving key on the arbor from interfering with the hole being reamed or disfiguring the cutting edges of the reamer.

Showing Two Ways of Grinding Reamer Teeth.

The fluted shell reamer type as shown in Fig. 1, is provided with a greater number of flutes for the same size than are ordinary fluted chucking reamers, because the flutes must be shallow on account of the hole thru the reamer. The flutes are cut, however, with the same kind of fluting cutters as are used for reamers generally. The corners at the end of the fluted shell reamer are slightly rounded.

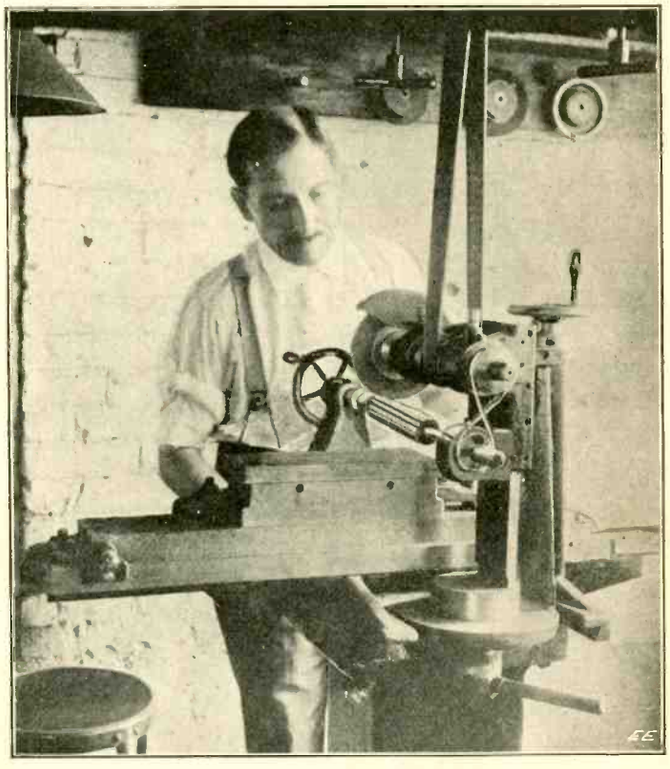


Fig. 5. Reamers Are Usually Ground to Final Size on a Precision Grinding Machine of the Type Here Shown. With Such a Machine the Reamer Can be Ground to Any Taper Desired with an Accuracy of One-Ten Thousandth of an Inch.

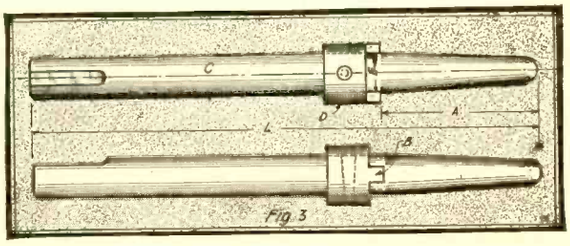
The arbor used for driving shell reamers consists of a stem or arbor proper C, as illustrated in Fig. 3, provided with a collar D, fastened to the arbor by means of a taper pin. A tongue B is milled at the end of this collar, which constitutes the key fitting the keyway in the reamer. Precaution should be taken during the "milling process" to ascertain the exact centering of the tongue in the collar. Care should also be exercised in milling the keyway in the reamer. When grinding the outside of the reamer to size, this work should be done on an arbor similar to that on which it is to be used. The arbor as well as the driving collar should preferably be made from tool steel and the collars should be hardened. The arbor as generally manufactured, is made in fourteen sizes, the diameter of each being measured at E, half-way between the end of the key and the solid part of the body of the collar, D. The arbor has a flat milled on the shank for the set screw by which it is clamped and held in position in the machine where it is used.



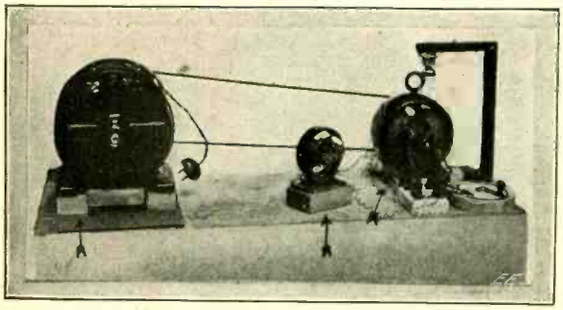
Too great or too little clearance on the teeth of a reamer will tend to produce unsatisfactory results, the first invariably causing the reamer to wear to a greater extent, as the shavings get in between the cutting edges and the work to be reamed, thus slowly grinding away the cutting edges. Also there is a tendency to bind the reamer in the hole, consequently injuring the hole as well as the reamer, and causing more exertion in performing the reaming operation.

The Steel Arbor Used for "Driving" Shell Reamers Consists of a Stem C, Provided with a Collar D, Fastened to the Arbor by Means of a Taper Pin. A Key or Tongue B Is Milled on the Collar to Hold the Reamer.

The *flat relief* or *clearance*, altho mostly used, is not the most desirable, because the cutting edge is not properly supported. Best results are obtained by a clearance, as shown in Fig. 4. The difference between this clearance or relief and the flat is obvious from the illustration, where the relief is shown by dotted lines "B." It is usually termed the *eccentric relief*, and its use is strongly recommended, as it adds greatly to the capacity of the reamer for producing a smooth hole. The relief is produced by placing the reamer in a grinding machine as usual, not on centers in line with the spindle, but on auxiliary centers provided with adjustable side ways, so as to enable them to be set at different positions for different relief required on various sizes and kinds of reamers. The reamer is thus held eccentrically. A rocking motion is then imparted to the spindles holding the auxiliary centers, and in this manner, the grinding wheel traveling back and forth along the reamer, will produce an eccentric relief.

The eccentric relief, however, is not in

(*Continued on page* 438)



HOW-TO-MAKE-IT

This department will award the following monthly prizes: First Prize, $3.00; Second Prize, $2.00; Third Prize, $1.00.
The purpose of this department is to stimulate experimenters towards accomplishing new things with old apparatus or old material, and for the most useful, practical and original idea submitted to the Editors of this department, a monthly series of prizes will be awarded. For the best idea submitted a prize of $3.00 is awarded; for the second best idea a $2.00 prize, and for the third best prize of $1.00. The article need not be very elaborate, and rough sketches are sufficient. We will make the mechanical drawings. Use only one side of sheet. Make sketches on separate sheets.

FIRST PRIZE, $3.00

MOTOR AND GENERATOR SILENCER.

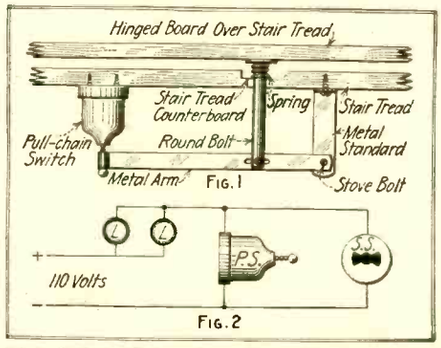
In carrying on experiments in electricity and having only 110 volts alternating current at my disposal, I recently added a motor-generator set to my equipment. As my experiments were necessarily performed at night, due to work in the daytime and having due consideration not to annoy the people on the opposite side of the house at late hours with the humming of a motor and dynamo, the selection of a quiet running piece of apparatus became of prime importance.

Do You Have Trouble With Noisy Motors? Eliminate It! Mount the Offending Machine on Sponge Rubber As Indicated by the Arrows.

A high grade, 6 volt, 6 ampere dynamo was obtained which proved reasonably quiet, but when firmly secured to a 1½-inch board with a one-eighth horsepower motor likewise mounted, driving it, the noise was quite offensive. Most small motors of the alternating current type are very quiet when well bolted onto a concrete or iron foundation, but when mounted on a wooden plank 1½x12x30 inches it is another story. The first motor of 1,750 R.P.M. type was very good, but a little too noisy, and by obtaining a similar machine running at but 1,140 R.P.M., the noise was cut down fully two-thirds.

Of course, these results were encouraging, but my progress was still retarded by the noise made which I knew was not good to put "kids" to sleep by.

It finally occurred to me to use some soft silencer such as cork or rubber, and after numerous experiments with everything I could think of, I was finally successful. For the ⅛ H.P. 1,140 R.P.M. motor I secured three pieces of regular *art gum* from a 10 cent store. These blocks of soft "rubber" measured exactly 1x2x3 inches. They were mounted with LePage's glue to both the base of the motor and dynamo, and when placed on the board, the two machines could be operated with an exceedingly tight belt tension with no "walking" of the apparatus, even after hours of operation.



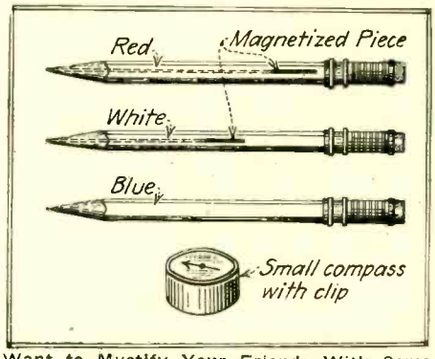
Contributed by C. V. TURNER.

[*Editorial Note—Those having noisy phonograph motors will find it efficacious to mount the feet of the motor on art gum or "sponge rubber." Tests have shown excellent results.*]

SECOND PRIZE, $2.00

CONTROLLING THE CELLAR LIGHTS.

The arrangement with which this is accomplished is shown in Fig. 1. A pull-chain switch of proper size to handle the lamps on the circuit is mounted on the *under surface* of the uppermost stair tread. The chain is shortened to an inch or so, and is attached to a metal arm pivoted on a metal standard which is screwed to the tread a short distance from the switch. At a point near the standard the metal arm is slotted to take a small stove bolt which fastens the slotted round bolt movably to it. This bolt passes thru a hole in the tread which is also counterbored to allow the bolt head to lie flush when the coiled spring under it is fully deprest. A board cut to the same size as the tread should be hinged to the riser above it so that the board will lie flat against the top of tread when stept upon. Coiled springs should be placed between the two at each end, to keep the front edge of the board separated about half inch or so from top of tread. This is all that is necessary as the small movement of bolt is increased by the leverage of the metal arm. The action of the device is obvious. As the top board is trod upon, it is deprest, moving the bolt downward against its spring, which movement is amplified and communicated to the pull-chain of switch by the metal arm, thus turning the switch "on." When weight is released, the board and other parts return to their original positions. When the board is again trod upon, the action is repeated, this time turning the switch "off." No dimensions are given as the sizes of the various parts will vary according to the size of switch and other conditions. As it is sometimes desired to leave the lights (LL) "on" while repeatedly passing up and down the steps it will be well to install a snap switch (SS) in the usual position and connect it in multiple with the pull-chain switch (PS) as depicted in diagram Fig. 2.



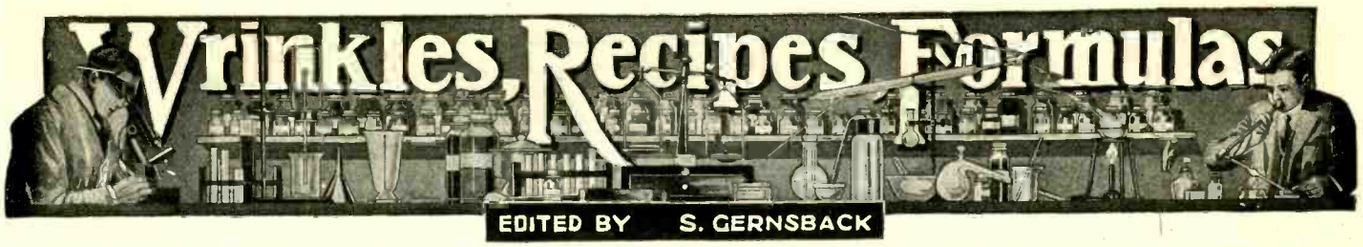
The Cellar Lights Are Turned on and off Automatically by This Stair-Tread Switch Wrinkle. The Moving Tread is Attached as Shown to a Pull-Chain Socket.

Contributed by J. A. WEVER.

THIRD PRIZE, $1.00

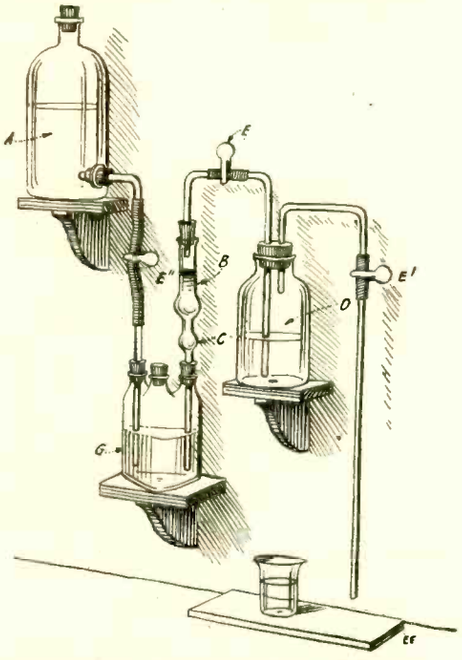
THREE MAGIC PENCILS—A MAGNETIC HOAX.

EFFECT: Three colored lead pencils are given out for examination, red, white and blue, for example. The performer leaving the roon. tells anyone to choose any color pencil they wish. while he is out of the room, and to wrap it up in any color piece of paper or cloth, and to hand it to him securely wrapt when he returns to the room. Upon receipt of same the performer passes hand over pencil and tells exact color.



Want to Mystify Your Friends With Some Hindu Pencils? Here's How: With a Magnet Placed at Different Positions in Two or More Pencils, Conceal a Small Compass in Your Cuff. The Rest Is Easy—You Can Tell at Once Which Colored Pencil Is Inside an Envelope, Even Tho It Was Wrapt up While You Were Absent from the Room.

SECRET: Two of the pencils are "faked" in this manner. One of them is drilled with a 1/16 inch drill in the rubber end about 1 inch, and the other one is drilled half-way down or in the middle. Two pieces of Stubb's drill rod, ½ inch long by 1/16 inch diameter, are hardened, magnetized and inserted in the drilled holes and a piece of lead is inserted after the magnetized pieces and are made flush with top of wood in rubber end of pencil, the rubber is placed on top and the trick is ready; the third pencil contains no fake whatever. In leaving the room the performer attaches to his shirt cuff, inside, a small compass (some of these compasses can be obtained as small as a dime, or even of less diameter), which aids him in detecting what pencil is wrapped up or concealed in the cloth or paper in this way: He slowly passes pencil in front of compass and watches needle until it quivers, which it will do when that part of pencil containing the magnetized steel passes needle. If the needle moves when the *end* of pencil is near it, the performer knows it is the *red* one. If it moves when near the *middle* of pencil, he knows it is the *white* one; if needle does not move, it must of course be the blue one. As the back of hand faces audience, the compass is invisible.



Many variations of this magnetic trick will suggest themselves to the wide-awake experimenter. Such as the magnetic "brass" ball—the inside of the ball is filled with iron filings and the small filling hole stopt up with brass.

Contributed by R. S. MYERS.

A NEW FORM OF HYDROGEN SULFID GENERATOR.

From time to time, in various issues of your splendid magazine, I have noticed *hydrogen sulfid generators* of numerous

This Highly Efficient Hydrogen Sulfid Generator Can Be Made Up from Glassware Found About Every Amateur Chemist's Laboratory.

types and styles described, but I have come to the conclusion that none of them work as easily or are constructed so simply as the one I now have in use in my chemical laboratory. I give herewith a drawing of the same, and will try to render a coherent explanation of its manipulation.

I will first make a notation of the apparatus used:

1 Aspirator bottle.*
1 Woulff bottle (three neck).
1 Calcium chloride drying tube.
1 Large bottle.
Glass tubing.
Rubber tubing.

I will now give a list of the apparatus and liquids denoted by the letters in the drawing:

"A"—Hydrochloric acid.
"B"—Iron sulfid.
"C"—Mineral wool or asbestos.
"D"—Water.
E, E', E"—Pinchcocks.
"G"—Hydrochloric acid.

I don't think it will be necessary to go into detail in reference to the construction of the apparatus, as I believe the sketch fully covers that, but give here a few points on the manipulation:

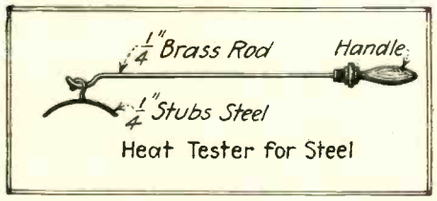
Open the pinchcock E" and allow the HCl to flow into the Woulff bottle; this will compress the air in the Woulff bottle. When the HCl stops flowing from the aspirator bottle, owing to the compression of the air, close the pinchcock E". Now open the pinchcock E and the HCl (G) will rise in the calcium chloride drying tube, thereby covering iron sulfid (B). (If the compression of air is not sufficient in the Woulff bottle to do this, again open pinchcock E" until the HCl rises in the drying tube sufficient to cover iron sulfid (B). Open pinchcock E and the gas generated will pass over into the large bottle containing the water (D). In this bottle the gas will be washed, and will also form a supply of the gas above the level of the water. Open the pinchcock E' and the gas will flow in a steady stream.

When one is thru with the gas all that is necessary is to close pinchcock E' and then close pinchcock E. Gas will continue to generate and will, owing to no outlet being open, force the HCl, covering the iron sulfid, back again into the Woulff bottle.

When the strength of the HCl, "G," becomes exhausted it can be removed from the Woulff bottle and, owing to the filtration caused by the mineral wool "C," is ready for evaporation for the recovery of the ferric chlorid. Another feature is that one has at all times hydrogen sulfid water on hand owing to the washing of the gas in the large bottle thru the water D. The reason for using a three-neck Woulff bottle is this: that when the pressure in the Woulff bottle, caused by the compression of the air, and also the gas liberated when pinchcock E, is closed immediately after use, will sometimes become too great for the strength of the glass, and so as a "safety first" measure, the three neck bottle is used so that the cork in the center, not in use, will act to liberate the surplus pressure.

Contributed by
WILLIAM N. NUSHAWG.

* An Aspirator bottle is not necessary, as the liquid (A) can be syphoned out of any ordinary bottle.



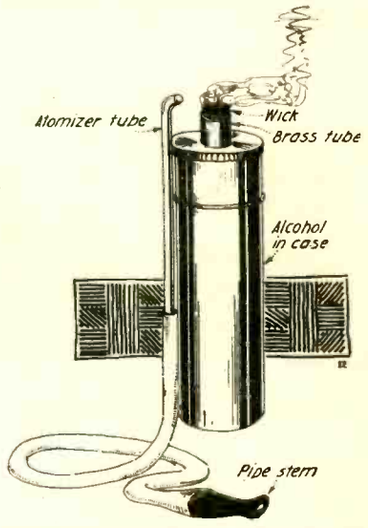
MAGNET TEST FOR HEAT OF STEEL.

One of the best and little-known methods of determining the correct heat at which to quench a piece of steel to obtain the best results, without the use of a pyrometer, is the following:

Take a piece of ¼" Stubb's steel about 2" long, tap a small hole in the center for a small screw eye, then harden and magnetize after bending to the shape shown in illustration. Place in screw eye and hang on the end of a brass rod bent to the shape shown in sketch.

The principle of the method is based on the fact that a piece of steel will not attract a magnet after a certain temperature is reached (about 750° Fahr.).

The little magnet is held over the heated steel every few minutes until the heated steel no longer attracts it, when it is then quenched and the degree of hardness it attains will be perfect.



The Principle of This Steel Heating Tester Is That Above a Certain Temperature Steel or Iron Will not Attract a Magnet. Hence: When Is a Magnet not a Magnet? Answer. When It Is Red Hot.

Of course, the steel is to be drawn again to the required color. The above method is known to a very few mechanics.

AN ALCOHOL BLOW-TORCH FROM JUNK.

Want a nice little blow-torch? Below are given the details of an easily made blow-torch that will give as good results for soldering, etc., as the regular torch. It is constructed from a nickel-plated shav-

Who Wants an Alcohol Blow-Torch? Every Electrical Man, and Here's How to Make One from a Shaving Stick Case for Nothing. If You Are a Religious Prohibitionist You Can Burn Gin or Whiskey In Your Torch.

ing-stick case. The top of this case has a hole about three-quarters of an inch cut into it, and a piece of brass tubing inserted and soldered. Thru this runs the cotton lamp wick, dipping into the alcohol, contained in the case. Cotton wicking can be purchased in any hardware store. A piece of an atomizer tube, bent as shown in the illustration, is soldered or otherwise secured to the side of the case, connecting with a rubber tube. At the end of this a mouthpiece from "Pop's" old pipe stem is fastened. This makes a good, neat torch, welcome in any work shop or "lab."

MAKING CHLOROPHYL.

Chlorophyl is the green coloring matter common to growing plants. Take a handful of parsley and triturate in a mortar with enough alcohol (95%) to cover the mass. Decant the green liquid and allow it to evaporate spontaneously. The chlorophyl remains as an intensely green substance. This may be used to color candies and as cake icings.

Dye from Onion Skins: Take the outer skins from half a dozen onions (medium-sized) and boil in water until the color is extracted. This is a very suitable yellow dye.

Test for the Purity of Olive Oil: Shake equal volumes of the oil and nitric acid. Pure oil should turn from pale to dark green in a few minutes. If it changes to brown, red, or orange, the addition of a foreign oil is indicated.

Heat for five minutes in a water bath at 100°C. It should become pale yellow to orange yellow. On standing it will, if pure, become a yellow solid.

Contributed by FRITZ ZILLESSEN.

RADIO DEPARTMENT

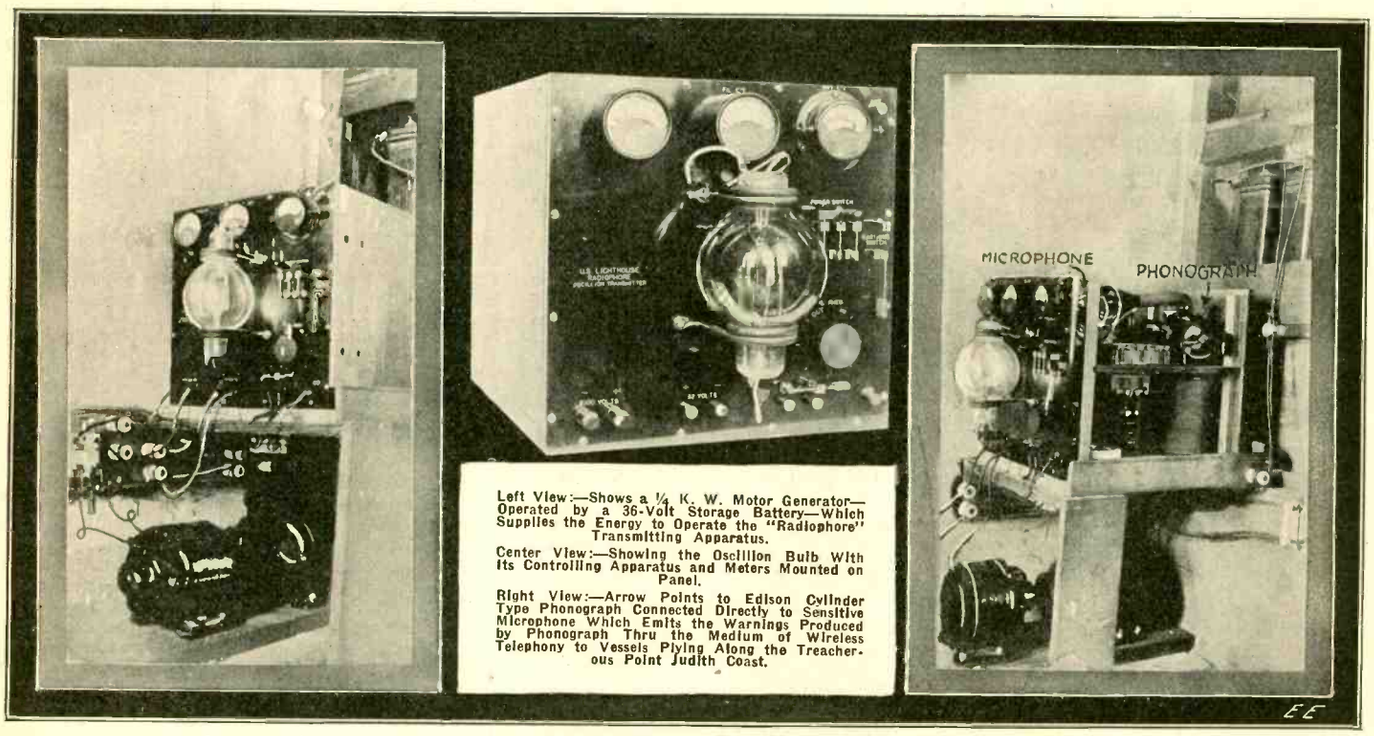
The "Fog Warning" Radio Telephone

THE accompanying illustrations show the interior mechanism used in the wireless telephone "fog warning" signal installed at the Point Judith Light near Narragansett Pier, R. I. This is one of the most treacherous sections on the Atlantic coast for ships to negotiate. For some time the DeForest "Radiophore" has been in use at this lighthouse station. It comprises an old type cylinder phonograph fitted with a record and repeating mechanism, which operates an Oscillion vacuum bulb, in such a way that the following warning is sent out by wireless telephone waves from an antenna, to ships as follows: "Point Judith Light," which is repeated three times. Then the skipper on the boat, or his wireless operator, hears, "You are getting closer, keep off," at about ⅕ volume of the first warning. Until the vessel approaches the danger limit, it does not hear the necessary final warning, but simply the first "location" warning.

The energy used in operating this warning signal is one-fourth kilowatt. The Oscillion vacuum tube generator of the radio frequency oscillations, is a 3¾-inch bulb. Heretofore the wave length was varied automatically for the different signals by a motor-driven variometer, but owing to the difficulty experienced by the ship radio operators in trying to pick up the constantly changing wave length signal and to hold it, the warning is now sent out on a fixt wave length of 600 meters, whereas with the constantly changing wave length previously used, the final message, "You are getting closer, keep off," was liable to be mist.

The first real test of this apparatus has been taking place at Point Judith Light (near Narragansett Pier), and the apparatus is arranged on a very compact scale so that it can be attended to by the regular lighthouse keeper and assistant. A regulation gasoline engine connected with a 36-volt direct-current generator and storage batteries is used to supply the energy, to which is coupled a motor-generator set which operates the transmitting apparatus.

This apparatus is entirely enclosed in a compact cabinet measuring about 18x18x18 inches. On the front of the cabinet is the Oscillion bulb and necessary switches for regulating it; also connection posts for aërial and ground wires. On the side of the cabinet is a small door which gives access to the mechanism inside.



All the working parts are mounted inside the cabinet, including a motor-driven phonograph (see photographs herewith), speaking directly into a microphone. The arrangement of the cylindrical records is such that they repeat automatically, the saffire needle being set back to the beginning each time after it has traveled the length of the record. Each record has an average life of about 60,000 repetitions.

In the circuit diagram may be seen the relative layout of the various horns, microphones, and the Oscillion bulb generator of the radio frequency oscillations used to propagate the vocal message.

Several other modifications of the underlying principles may also be utilized as described in Dr. de Forest's patent. The transmitting apparatus is so arranged that speech can be sent out from the large fog horns, as also musical notes, bell signals, et cetera; on the same prearranged schedule as the radio signals. In this scheme the phonograph with records containing speech, is coupled to a microphonic arrangement and the speech is intensified by means of audion amplifiers and the sound waves sent out thru the fog horns, thereby enabling the captain or other officer to hear the same by ear, *without* the aid of wireless apparatus.

The one big feature of the Point Judith Light equipment is that when a ship is within a range of eight miles of the lighthouse, it will hear the following words flashed by wireless every five seconds: "Point Judith Light;" and after every

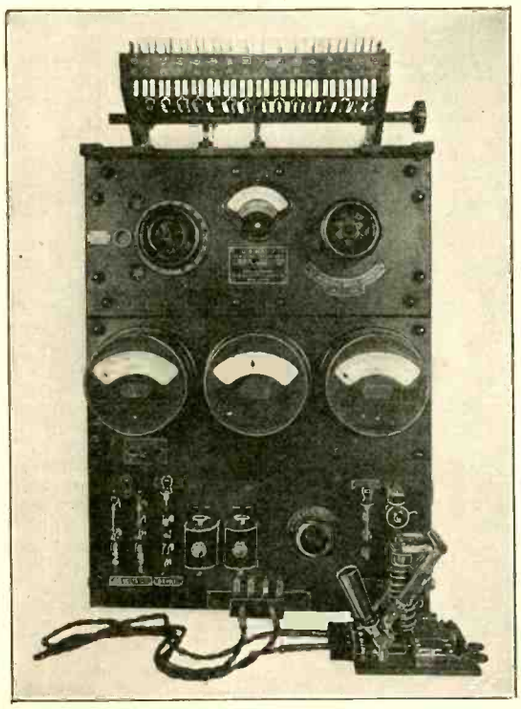
New 1 K.W. Quenched Gap Transmitter

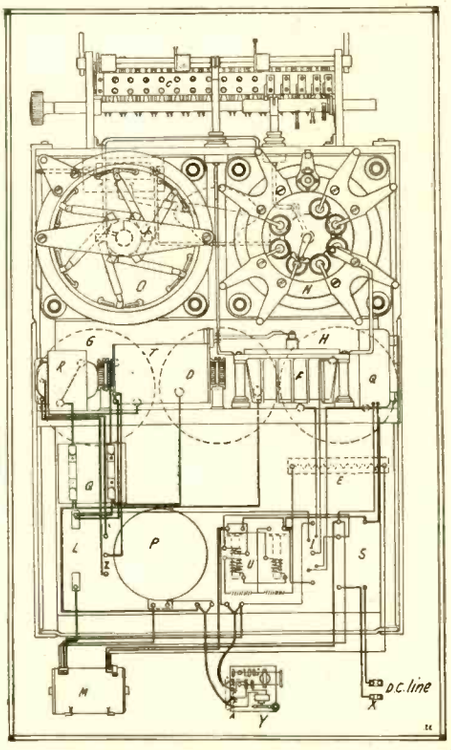
By Lester F. Ryan

THE 1 K. W. panel radio set as is described in the following article, is identically the same in principle and operation to the one described in the July issue of the ELECTRICAL EXPERIMENTER, except for the spark gap. The panel consists of two bakelite-dilecto pieces, the upper panel having the hot wire ammeter, wave changing device and the spark gap mounted upon it. The lower has the volt and ammeter control switches and automatic starter mounted upon it. The voltmeter is of the double scale type. The motor-generator is of the Crocker-Wheeler type, and is driven counter clockwise from the motor end by direct current at 120 volts. It is rated at 2 1/10 horsepower and 1.25 K. V. A. or 1000 watts, at 80 per cent power factor. It is a 500 cycle machine and has 15 field poles. The motor field is controlled by a Ward Leonard 18 point rheostat. This varies the frequency between wide limits. The automatic starter consists of five parts, two solenoids, and two contact discs and plunger, also a common resistance box.

The transformer used with this set is of the closed core dry-type and is rated at 1000 watts, 500 cycles and 150 volts at the primary winding terminals. The ratio of transformation is 38 to 1. It is insulated to stand electric stresses of 30,000 volts and will stand a 50 per cent overload.



The condensers used are of the Dubilier type of .004 microfarad capacity each, connected in parallel. They are made of selected mica and tested for 100 per cent overload which is more than is ever used.



The spark gap which is used with this set is mounted on the top of the panel as shown in figure. The gap consists of a *gap holder* and *power changer*. The gap is horizontal and has a row of fifteen pockets; each pocket accommodates a gap unit as shown in photos. When a gap unit is inserted in a pocket it separates two leaf springs. The pressure of these springs against the gap insures perfect contact. The springs come together as a gap is removed and in so doing bridge the break in the gap holder circuit.

A switching mechanism is also associated with this holder. It consists of two shafts, one above the other and parallel to the row of gap pockets. Each shaft is provided with switch jaws which engage knife blades fitted to the gap holding pockets as shown in figure. The top switch shaft is used for the changing of power. Each movement of its handle inserts or removes gap units in groups. The switch jaws slide over this shaft so that the operator may vary the number of the gaps in a group at will. The three positions of this switch are *Low, Intermediate and High.*

The second and lower switch shaft allows five gaps to be inserted one at a time. The switch engages knife blades projecting from the rear of the first five gap pockets as will be seen. This

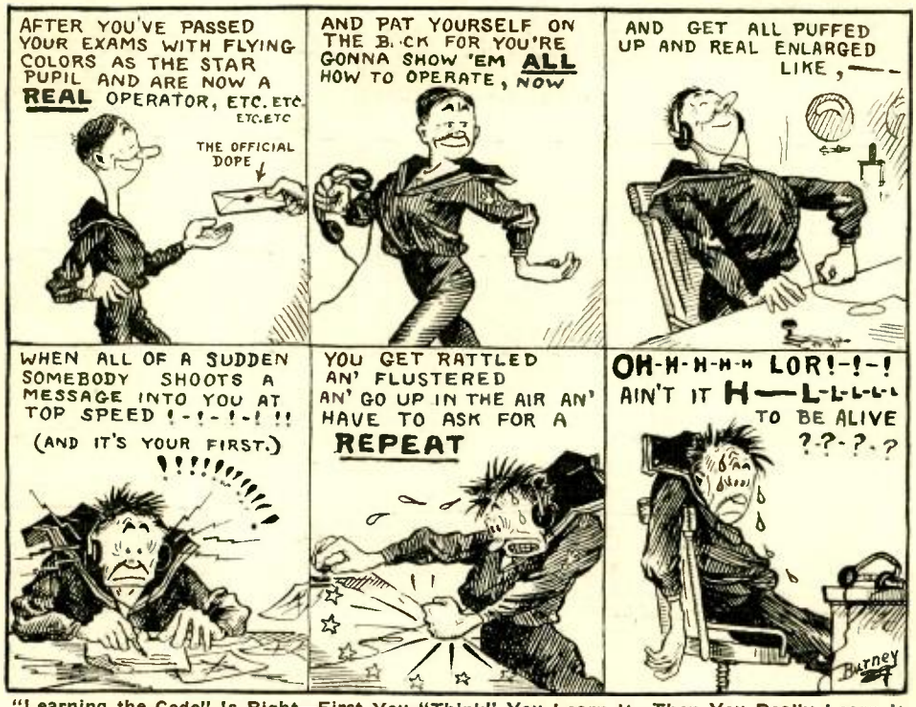
Front and Rear Views of 1 Kilowatt Quenched Gap, Panel Radio Transmitter. This Set Has Been Extensively Adapted by the United States Navy and Has Given Excellent Satisfaction. The Quenched Gap Units Are Easily Replaced at a Moment's Notice and Can Be Quickly Repaired When Necessary. The Gap Plates Are Separated by Thin Fish Paper Gaskets. The Set is Noiseless in Operation.

Valves

By PROF. A. U. DION, G.R.I.D., D.C., A.C., H.F.C., T.S.F., etc., and MR. LETIT LEAK, E.M.F., O.T., etc. (Local Plumber)



Introduction

In this little article I have tried to set down a few facts and fancies regarding the valve as used in the practice of wireless telegraphy.

They are the direct result of information collected whilst acting in the capacity of W/T operator in one of Britain's aërial dreadnoughts, although much of the advanced technical matter is the result of Mr. Letit Leak's untiring research, and to this gentleman I publicly extend my heartfelt thanks for his invaluable assistance in compiling this treatise.

Author's Note

Thru long association I had come to look upon the W/T valve as the only valve in the wide, wide world, so vividly were its advantages and merits imprest upon me at Cramwell College. I am assured by Mr. Letit Leak, however, that this is quite a fallacy. He tells me that there are H.P. and L.P. steam valves, gas valves, ball valves, and bi-valves, not to mention innumerable others, besides the common or garden dot-and-dash variety.

"Learning the Code" Is Right—First You "Think" You Learn It—Then You Really Learn It All Over Again, As Mr. H. B. Burney Here Illustrates In His Own High Frequency Style.

Valves W/T may be placed in four categories:

(1) The Round Valve (deriving its name from the inventor, not from its shape).

(2) The Hard Valve (has slightly longer life than the soft valve when exposed to the tender mercies of the new operator thirsting for knowledge).

(3) The Soft Valve (so called because it is satisfied with fewer volts than the foregoing instance, and therefore does not require so many ration books).

(4) The "Q" Valve (better known as the "Hush, Hush" valve). By simple proportion it will readily be seen that 31,967 such valves would receive signals from the planet Jupiter.

All four types are much of a muchness in general principle, differing only in detail.

Taking them collectively, a valve consists of a chunk of vacuum surrounded by a layer of glass. A most essential part is the small tip generally found on top of the vacuum. Its precise use has yet to be determined, but Mr. Letit Leak assures me it is a most important *point*. I do not intend to trouble my readers with smaller details, but, in passing, it is imperative to direct attention to a fundamental necessity, which valve manufacturers dare not overlook—viz., the necessity for placing some small parts within the vacuum. These are:

(1) *The Filament.*—A very fragile piece of tungsten made up of 10^{55} negative electrons. Its function is to illuminate the vacuum in order that the student may see how the other parts work.

(2) *The Grid.*—Consists of a number of holes joined together by small pieces of metal. Acts as a shade over filament to protect student's eyes.

(3) *The Sheath.*—A sheet of metal enclosing both the filament and the grid. Prevents small pieces of vacuum, dust or dirt from falling on the filament and affecting its lighting capabilities.

At the bottom of the valve are a number of tags, generally four, although a few more or less should not worry the student. I was under the impression that these were to form a convenient method of holding the valve without making the glass dirty, but Mr. Letit Leak emphatically insists that these tags exist for the sole purpose of ensuring connection with the internal economy of the valve.

To Test Valves.—Carefully examine, and any cracks in glass bulb should be caulked with shellac to prevent the vacuum getting out.

To Test Filament.—Grasping the valve by the tags previously referred to, bang the valve several times in rapid succession against the edge of a bench (unless an anvil is handier), when it should give forth a clear, bell-like note. Should the filament fail to glow after this test, don't waste more time with it, but get another from the stores.

To Test H.T. Circuit.—Connect up to several thousand volts and forget the exact amount. A faint bluish glow will indicate that the H.T. has successfully run the gauntlet of the vacuum and is looping the loop between the filament and sheath, a process known technically as *oscillation*. Should no blue glow be detected and the valve and student still survive, throw the valve away—it is a dud.

To Test Vacuum.—Knock off small tip mentioned previously, and if vacuum is good a faint hissing noise is heard. When the hissing ceases, it denotes that Nature, which abhors a vacuum, has discovered the escape. It is not advisable to apply this test except as a last resource, owing to the extreme difficulty of re-packing the vacuum thru the small hole thus made in the glass.

From the foregoing remarks the student must draw his own conclusions as to the advantages of valves. Our W/T officer says that their tendency to disappear completely and mysteriously is not so marked as that of the carborundum crystal. He attributes this to the post-war amateur not being possest of sufficient filthy lucre to purchase enough high tension to operate the valve, while the current price of volts is so excessive.

Finally. — Mr. Letit Leak informs me that, owing to the super-sensitive qualities of the valve as a detector, it is probable that Scotland Yard will shortly assume the entire control of the valve industry, and every detective will be fitted with seven valves. Police constables, on the other hand, will only be provided with amplifiers.—*Wireless World.*

DE FOREST DEFENDS HIS 3-ELEMENT AUDION

In the interest of fair play and scientific fact Dr. Lee de Forest, acknowledged among scientists as the inventor of the 3-electrode audion or vacuum tube which has made possible the present development of the radio telephone, has made public an open letter to the Editor of the *London Morning Post,* England, protesting against the reported unfair statement of Dr. J. A. Fleming, British scientist, in connection with his series of Cantor lectures in the theatre of the Royal Society of Arts.

The letter written by Dr. de Forest is based upon an article publisht in the *London Morning Post* of February 25th entitled "The Future Telephone—Imperial Conferences by Wireless" in which the perfection of the three-electrode audion is credited to Marconi. The article reads as follows:

"Dr. J. A. Fleming yesterday concluded his series of Cantor lectures in the theatre of the Royal Society of Arts with an account of the thermonic and crystal detectors, which, as he said, have taken an important part in the war. He described how the radiant point from which wireless messages are sent, could be determined by angles taken from two receiving stations, so that the exact position of ships and Zeppelins could be ascertained, and that means whereby electric oscillations could be detected thru the telephone in an airplane above the sound of the engines. Thermionic detection has been enormously developed, and the audience was interested to hear how these instruments, which are the basis of wireless telephony, arose from the discovery by the lecturer himself of a method of utilizing the curious fact that an ordinary filament lamp when incandescent

(*Continued on page* 460)

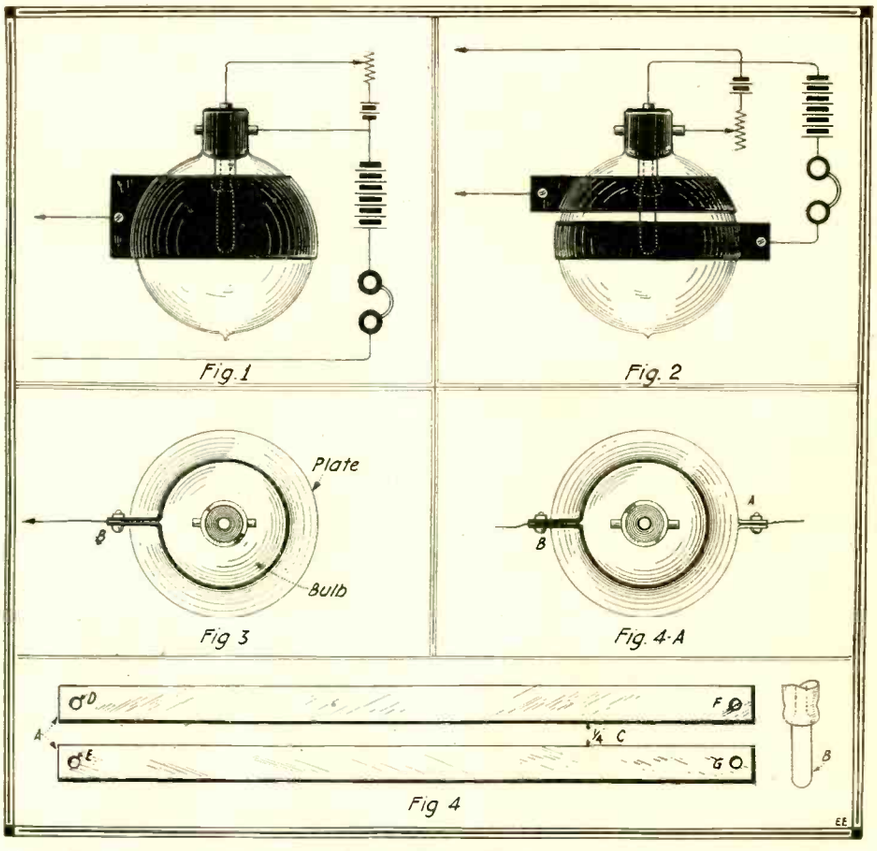
Vacuum Valve Construction

By R. H. Shaw

By reading this article carefully any Amateur should be able to construct a vacuum detector which will give excellent results. The completed valves are shown in Figs. 1 and 2 as well as connections for them. Several other connections may be used, but those shown have been found best.

In the construction of the valves an incandescent filament is used to produce the electron flow. For this purpose a miniature incandescent lamp with a carbon filament using about three volts should be used.

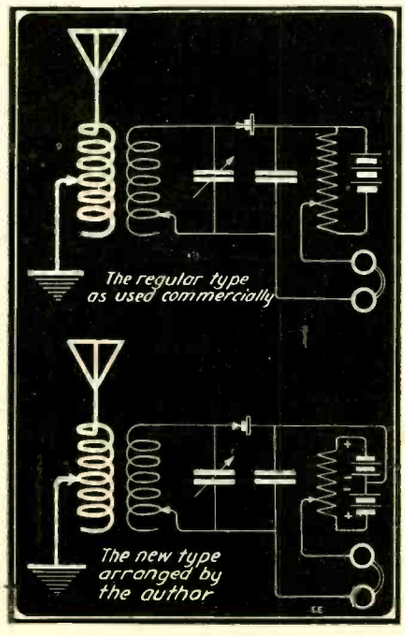
Having obtained such a bulb place a very thin strip of copper around it, as shown in Fig. 3. Fasten this plate by means of the nut and bolt (B). The plate connection is also made to this bolt.



The valve is now ready for use and is connected up as shown in Fig. 1. Adjust the filament to a very high brilliancy, being careful not to burn it out. Do not touch the filament adjustment having once adjusted it, but use the "B" battery potential until the incoming signal is heard loudest in the 'phones.

In Fig. 2 is shown a second type of detector. This differs from the one just described in that its plate is divided. A lamp of the same kind used in the above detector is used for this one.

The construction of the plate for this valve is shown in Fig. 4. A thin strip of copper long enough to go completely around the bulb as shown is first cut (A). This plate should be a little wider than the filament (B). Having cut the strip to the right dimensions a piece one-quarter of an inch wide is cut out (C), Fig. 4. The holes D, E, F, G are next drilled. The two plates are then fastened around the lamp and secured to the bolts (A and B), Fig. 4-A. The plate connections are also made to these bolts.



The valve is now completed and is connected as shown in Fig. 2. This valve is adjusted the same as the other one. An "A" battery of six volts and a "B" battery of fifty volts should be used with these valves.

The theory of operation of these valves is: As the glass becomes heated it allows the electrons being discharged from the filament to flow thru it and make connection with the plate on the outside of the lamp. The circuit from the filament to the plate is thus completed. It is therefore advisable to use a lamp containing a carbon filament as it produces more heat than a tungsten filament. The valves described herein are fully protected with patents and must not be manufactured for sale.

Home-Made Audion Designs for Two and Three Electrode Units. Made from Ordinary Single Filament Auto Head Lamps, Purchasable in Any Auto Supply Shop.

The Potentiometer—How to Use It

Above—the Old Way, and Below—the Improved Hook-Up for Obtaining + or — Current from a Potentiometer Circuit Without Switches

There has been very little said in print in regard to the use of this very important and effective instrument as a regulator of battery current which aids some types of crystals decidedly in their functioning.

In the majority of cases upon visiting the ordinary and even the advanced class of Amateur or Experimental stations, I have found that probably one in a hundred made use of this very necessary piece of apparatus. Once used, no one will do without it, owing to the following facts:

1. There is absolutely no carborundum which is not greatly increased in sensitiveness by its aid.

2. I have found upon investigation that there is not a piece of silicon which does not function better, to a greater or lesser degree, according to the kind used, by the aid of minute battery current and a potentiometer for regulation.

Even tho some experimenters do make use of a potentiometer they do not in all cases thoroly understand its operation and correct use in order to derive best results.

As a general rule potentiometers with a critical point of adjustment should be employed. Such a potentiometer would be one wound with fine wire and an over-all high resistance. This affords greater life to the battery shunted across it and allows one to hold point of adjustment at a greater length of time due to the fact that with large wire the battery dies out more rapidly and then it is necessary to readjust the potentiometer to allow the same amount of battery current to flow thru the detector.

A sliding contact potentiometer, if well constructed, should be used instead of the switch contact point arrangement, owing to the fact that it is impossible to arrive at an exact or critical point of adjustment with the latter.

Another point of great interest in connection with this apparatus is that the right polarity must be maintained, and in order to do this with the commercial form of potentiometer, it is necessary to first connect the detector or battery and "adjust"; if no increase in signal strength is found, it is then necessary to transpose either the battery or detector leads. To overcome such annoying procedures as just mentioned the author has arranged the following circuit for the potentiometer, which makes it unnecessary to change the leads of the battery or detector.

The instrument is termed a "duplex polarity potentiometer," and works in the following way: As will be seen from the diagram, the potentiometer is shunted by two batteries opposing each other; therefore no current will flow when the potentiometer slider is in the exact center of the instrument or windings of the same. If it is moved above center one set of polarities is had, and if moved below another set is obtained.

Contributed by E. T. JONES.

Eccentric Antennae

By EUGENE DYNNER

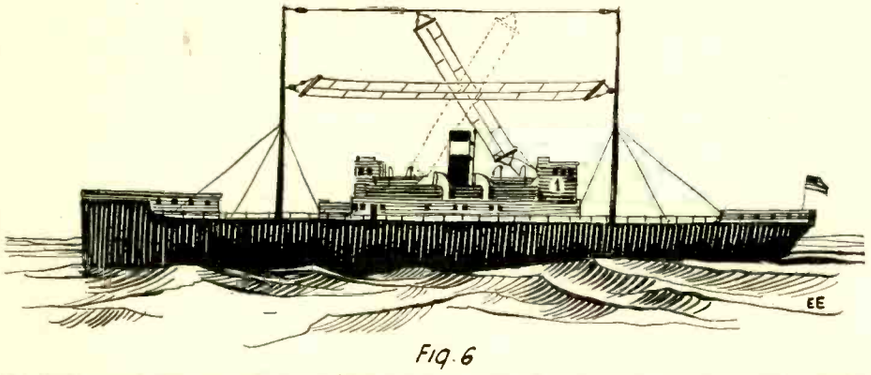


Fig. 6

Novel Form of Eccentric Antenna Tried Out on Ship-Board by the Writer. This Aerial, as May Be Seen, Is of the Cross-Connected Type. With This Form of Antenna, There Was Approximately 50 Per Cent Increase in Strength of Signals Over a 1,500 Mile Range.

SOME time ago experiments were made to develop an antenna which should give the maximum efficiency in reception of radiotelegraphic signals without necessitating the use of expensive apparatus. The first distinctive aërial developed was the one depicted in Fig. 1. This antenna consists of three wires which are connected together at intervals in length twice the width of the spaces between the wires, and measured in such fashion that one of the rectangles formed ends at the center of the adjacent one.

The receiving transformer used was of a special design, consisting of one stationary and three movable coils (Fig. 5). Coil 1 is a primary into which secondary No. 3 may be moved. Coils 2 and 3 also form a primary and secondary which may be brought closer to primary No. 1 or drawn further away. No taps are taken off, there being a double variometer action. A plain galena detector gave excellent results. The entire apparatus was connected as per Fig. 4. Condensers 5 and 6 are of .001 mfd., and condenser No. 7 may be a smaller one.

Using antenna No. 1 with this hook-up, there was an increase in efficiency of about 40 per cent. With coil 2 eliminated and 4 slid inside of 3, a decrease in wavelength resulted and the efficiency was increased about 5 per cent. when an audion was substituted for galena. Efficiency is calculated from results obtained by the use of an ordinary well-built loose-coupler with possibilities for variations by single turns. To test efficiency a device described several years ago in the ELECTRICAL EXPERIMENTER was employed.

With the loose-coupler in circuit and antenna No. 1, it was found that somewhat sharper tuning was accomplisht and signals were louder than those received with the ordinary type antenna.

Antenna No. 2 was found to cause a waste of energy, until the distance between wires 1 and 2, 2 and 3, etc., were separated at least 15 feet. This cage-like contrivance was 150 feet long. Even when this proportion was establisht the increase of efficiency over antenna No. 1 was less than 5 per cent., working under the same conditions.

A composite antenna and "ground" was built, No. 3, which gave excellent results. This arrangement, however, was found most efficient where the capacity of the two bodies was different. Putting the ground above the antenna gave a slight decrease in loudness of signals with broader tuning.

With the antenna depicted in Fig. 6, there was approximately 50 per cent. increase in strength of signals over 1,500 miles away—in direction opposite upper end of vertical antenna—was obtained. Addition of another section of antenna built in direction opposite to first one, gave the same strength in both directions.

In all cases the leads as indicated on diagrams were found most satisfactory. Substitution of single wires for three wire antennae gave practically the same results where the sections were over 300 feet in length, and reception was from stations using wavelengths of over 2,000 meters. For shorter waves the three-wire arrangement was found best.

The United States Navy is using extensively a type of aërial that has been developed in England, and which is used on all her battleships and destroyers. It is termed the "Barrel" type on account of its shape, which is cylindrical. On American battleships, it is anywhere from 75 to 150 feet long. On the smaller type of boat, the aërial must necessarily be much smaller. It consists of six wires arranged in barrel formation and supported every eight feet by three pieces of light bamboo, crost in the shape of a six pointed star. These pieces of bamboo may be of any length, thereby giving the aërial any diameter desired. The diameter is usually determined by the length. On our battleships the diameter of the barrel is anywhere from one to two feet. It may, however, be decreased to six inches for a very small antenna.

For the wire composing the aërial, the United States uses its standard phosphor bronze wire. This wire has been found to be the most efficient in every way. It does not corrode, neither does it rust nor deteriorate in other ways, as the usual kinds of wire do. One big trouble heretofore has been corrosion of the wire in the aërial, due to the action on it of the gases from the smoke stack directly below.

The English government, with whom this type of antenna originated, uses an entirely different kind of wire. They use ordinary copper wire of about No. 12 or 14 B. and S. gage. The bare copper wire is treated with a coat of black enamel, which is made from a specially prepared formula.

The enamel coat does not detract from

(*Continued on page* 470)

This Flat-Type Cross-Connected Aerial Showed an Increase of 40 Per Cent in Efficiency When Used With the Receiving Coupler Described

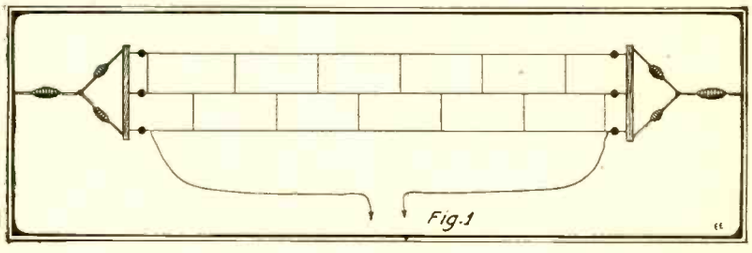

Fig. 1

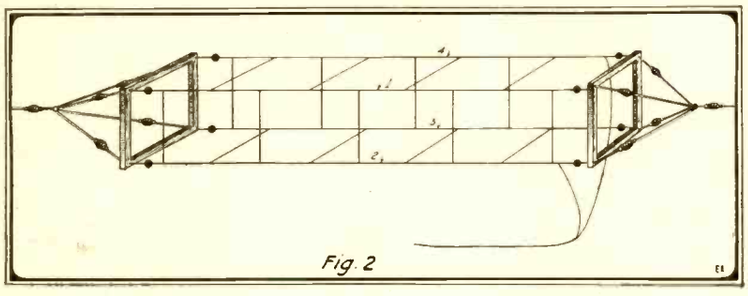

Fig. 2

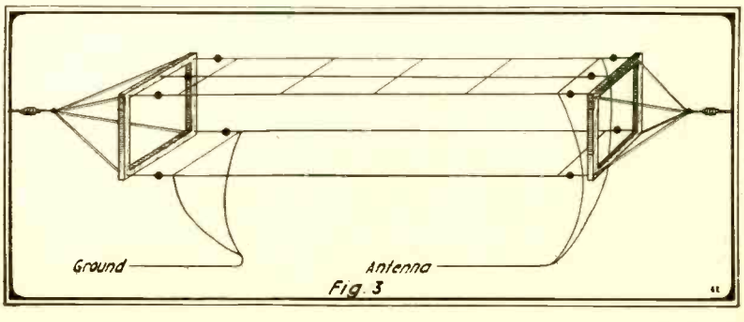
One Form of Cross-Connected Antenna Tried Out by the Writer With Gratifying Results. The Individual Wires Are of Course Carefully Insulated as Shown.

Novel Composite Antenna and "Ground"—This Design Gave Excellent Results, Says the Author. Placing the "Ground" Above the Antenna Gave Slightly Lower Efficiency.



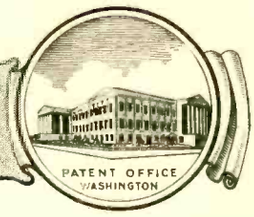


Fig. 3

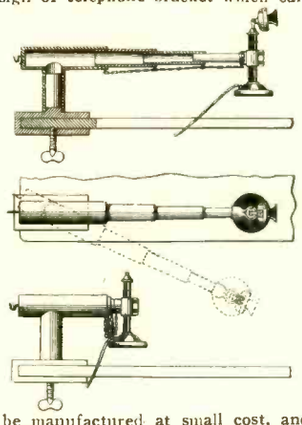
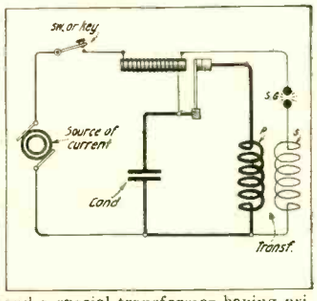


LATEST PATENTS

Telephone Bracket.

(No. 1,288,611, issued to Edward T. Jones.)

This represents a very simple design of telephone bracket which can

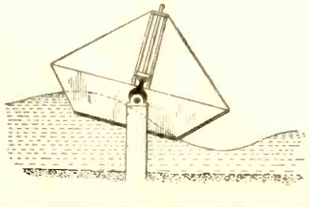


be manufactured at small cost, and still operate with the same efficiency as some of the more expensive and elaborate telephone devices of this character now on the market. The device comprises a series of telescoping metal tubes, which slide into one another when the bracket is to be collapsed, in the manner apparent. A chain is fastened to the successive telescoping sections so that they cannot be put out of alignment or beyond their limit.

Electric Igniter.

(No. 1,307,854, issued to William and Philip Dubilier.)

An electromagnet interrupter is used in conjunction with a condenser

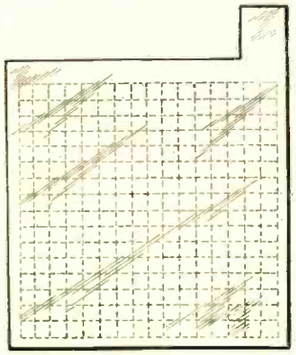


and a special transformer having primary and secondary windings, the primary of which is connected with the interrupter and condenser in such a way that this circuit becomes a tuned oscillator whenever the vibrator is in action. This circuit, in conjunction with a magnetic interrupter, is used to throw a spark across the gap shown, the line current maintaining an arc across the gap.

Wave Motor.

(No. 1,307,095, issued to William Gregersen.)

A surf or wave motor in which the float or body shown is made in the form of a boat pivotally supported, so as to rock with the rise and fall of the wave, and thereby operate a mechanism arranged to rotate a shaft in a continuous circulatory fashion. It is understood that two or more of these wave motor members may be used of course at one location, so as to give a much steadier rotative

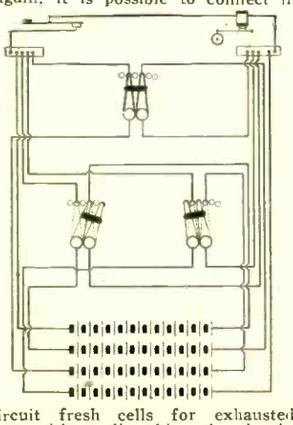


power to the main power shaft, and also to increase the amount of power developed in any instance. The rising and falling float is provided with suitable arms, connected with a set of pawl wheels and ratchets.

Storage Battery.

(No. 1,306,214, issued to Richard J. Crowley.)

A clever scheme providing for a new departure in the manufacture of storage battery plates or grids, having an active agent consisting of lead oxid and aluminum sulfate, and a method of producing a battery plate or grid paste of this compound. One object is to provide a battery element which will permit charging and discharging at a rapid rate without injury to the plates; providing a higher voltage at a heavy discharge and having a greater capacity in ampere-hours than other

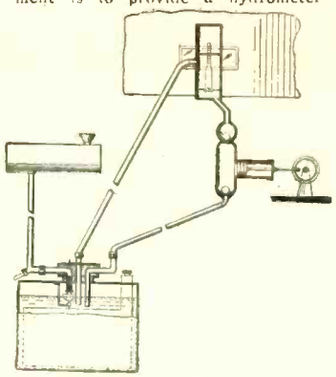


lead cells. Positive elements so made are said not to disintegrate as rapidly as peroxid of lead positives. The electrolyte used may be composed of sulfuric acid and water, but better still it is formed with an acid sulfate of aluminum. This is adaptable for transportation as a solid and only requires the addition of distilled water to form an electrolyte.

Battery Switch.

(No. 1,306,147, issued to Simon B. Hess.)

One of the principal objects of this invention is to provide a battery switching system by means of which large ampere-hour capacity may be obtained for using dry cells. Further, by the switching scheme here provided, it is possible to change the voltage of the battery system at any time without changing the original battery installation in any way. Again, it is possible to connect in

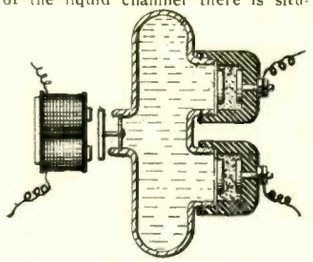


circuit fresh cells for exhausted ones without disturbing the circuit. When the battery system gives out entirely, and becomes no longer possible of manipulation adequate to increase the voltage, anyone not acquainted with the art will be enabled to readily replace old with the necessary new battery cells, and again make the system operative, owing to the simplified connection scheme shown.

Sight Storage Battery Tester.

(No. 1,308,223, issued to Ernest Camp.)

One of the objects of this improvement is to provide a hydrometer

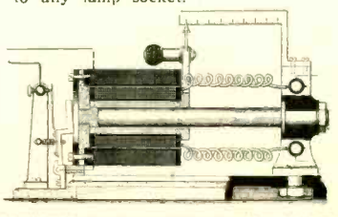


chamber having a connection to the storage battery cell, providing a means whereby the liquid electrolyte may be drawn into the hydrometer chamber, so that the electrolyte may be tested. The testing chamber may be placed upon the dash panel of the car so that the condition of the battery may be examined at any time. A further idea provides a means whereby distilled water may be supplied in small amounts from time to time.

Water Telephone Relay.

(No. 1,306,248, issued to Edward E. Clement.)

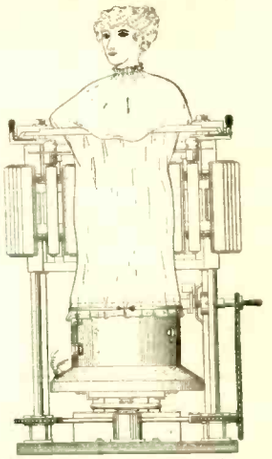
At one side of the liquid chamber shown there is placed a diafram actuated by a telephone receiver electromagnet system. At the other side of the liquid chamber there is situ-



ated one or more microphones. When an incoming sound current passes thru the receiver, it actuates the diafram and corresponding vibrations are transmitted thru the liquid, which may be water.

Induction Coil.

(No. 1,307,093, issued to Benjamin Fulton Gardner.)

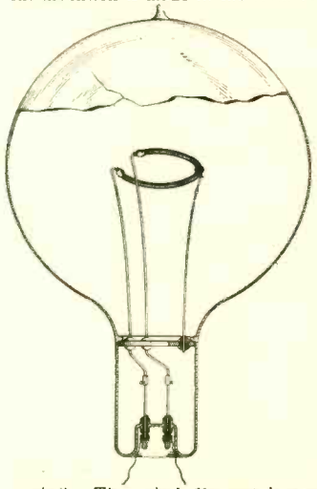


A reversible transformer for the purpose of stepping down or up either alternating current or direct current. There are two coils wound about an iron core and fitted with a vibrator. The outer coil is wound with fine wire and the inner coil is wound with coarse wire, the inner coil being movable along the iron core. A scale is provided so that the strength of the current may be watched as the regulating coil is moved along the core. The device can be connected to any lamp socket.

Electrical Reduction Apparatus.

(No. 1,305,439, issued to William E. Brennan.)

Those having a corpulent form, whether male or female, will be interested in this reducing apparatus invented by Mr. Brennan. One of the principal features of this apparatus lies in the use of an electric heating cell at the base of the structure, in order to give the person



under treatment a considerable rise in temperature while applying the massaging action by means of rotating wooden bars, shown in the illustration. As the inventor points out, any treatment of this nature for reducing the size or weight of a person is much more effective, and the results are more quickly and easily obtained, where the body is heated as well as massaged.

Improved Tungsten Lamp.

(No. 1,306,259, issued to Frederick G. Keyes.)

An improved design for tungsten lamps of high candlepower and suitable for operation on low voltage and high ampereage, in contradistinction to the usual form of high-voltage lamp. One of the features of this lamp resides in the mode of securing proper sealing of the lead wires and the anchors supporting the tungsten filament, which in the present invention is made in the form of

a spiral. The spiral filament is attached at its end to two lead wires made of copper sheathed with iron, the copper being utilized for its good conducting qualities, and the iron being employed for its rigidity, to prevent bending or distortion of the copper wire under the influence of the high temperature developed within the globe.

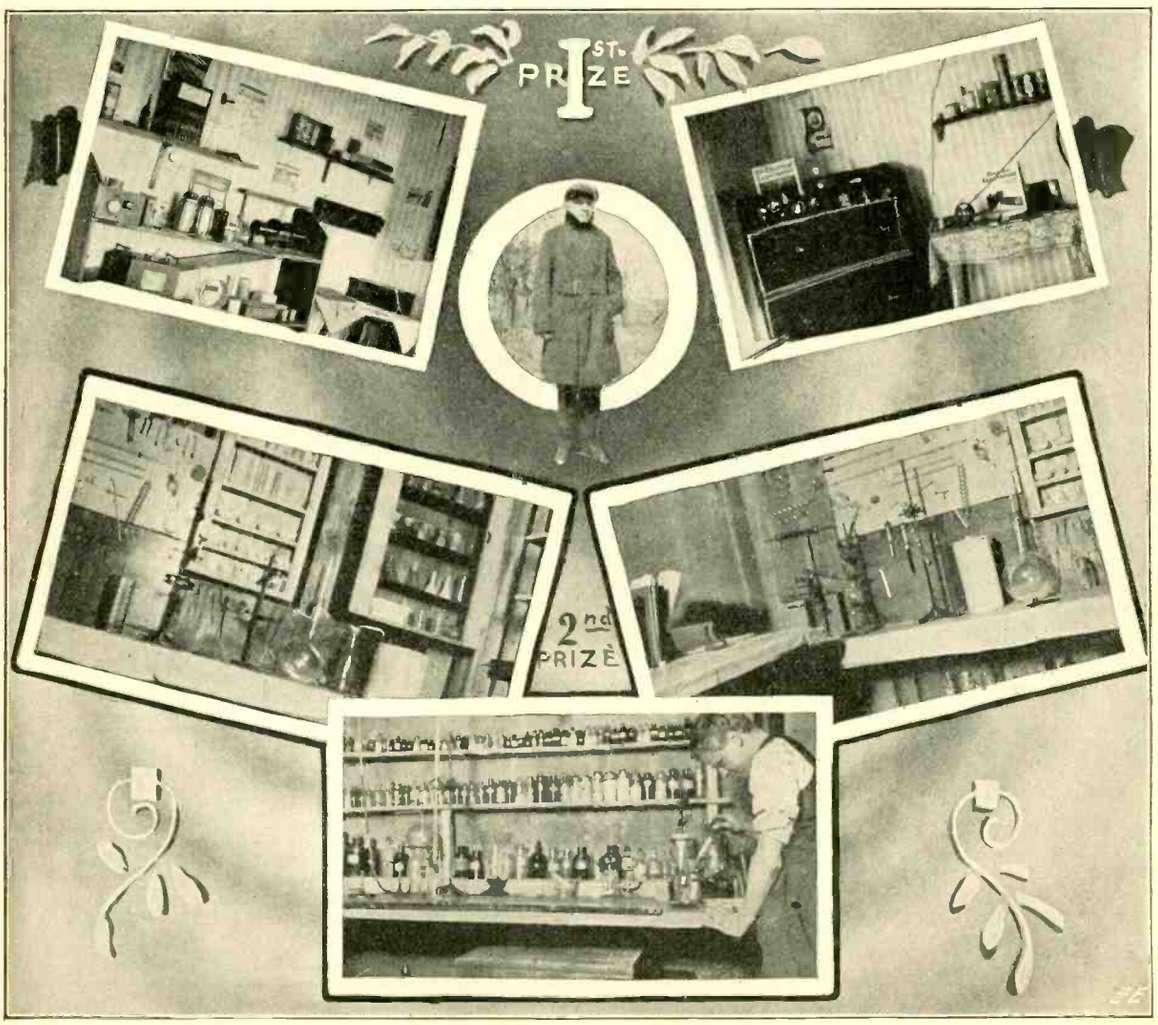
WITH the AMATEURS

Our Amateur Laboratory Contest is open to all readers, whether subscribers or not. The photos are judged for best arrangement and efficiency of the apparatus. To increase the interest of this department we make it a rule not to publish photos of apparatus unaccompanied by that of the owner. Dark photos preferred to light-toned ones. We pay $5.00 each month for the best photo or photos and $2.00 to each "Honorable Mention." Address the Editor, "With the Amateurs" Dept.

The Editors desire to call to the attention of all owners of "Electrical and Chemical Laboratories" the fact that hereafter the MONTHLY PRIZE WILL BE $5.00 CASH, instead of $3.00. ALSO $2.00 CASH WILL BE PAID TO EACH "HONORABLE MENTION" ENTRY PUBLISHT. We have not received any "Laboratory Photographs" of late. So "go to it" and send us your photo, together with that of your laboratory. If they are particularly good we may list some new and bigger prizes. So get busy, Boys!!! It's up to you. Here's a way to earn some greatly wanted laboratory apparatus at no cost whatever. Don't be afraid to send in too many photos, Boys.

"Amateur Electrical Laboratory" Contest

THIS MONTH'S $5.00 PRIZE WINNER— STANLEY C. REED



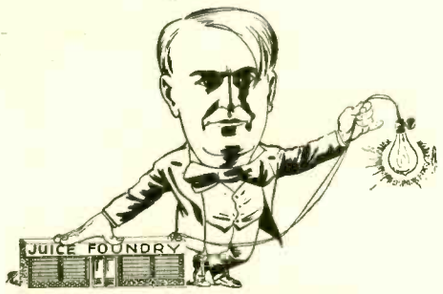
HEREWITH are three photographs of my electrical laboratory. I am sixteen years of age and have had my laboratory two years. I have a 6-volt storage battery, two Tesla coils, spark coils, a dynamo and a number of small motors.

I have a fairly complete wireless "Demonstrating Set" with seven-foot aërials, about ten feet apart. The receiving set consists of a coherer outfit and a detector set with a 75 ohm receiver.

I find the study of magnetism very interesting. I have made many magnets, compasses, galvanoscopes, galvanometers and similar instruments. Also my laboratory contains a chemical department in which I test soils, water, and perform other interesting experiments. In my experimental work I am guided by a library of thirty-five scientific books and the ELECTRICAL EXPERIMENTER.—Stanley C. Reed, Lennon, Mich.

HONORABLE MENTION—THEODORE FREDRICK $2.00 PRIZE PAID EACH "HONORABLE MENTION"

HEREWITH I present four pictures of my chemical laboratory, which is very complete, containing all apparatus used in general chemistry. I spend a great deal of my time in qualitative analysis including analysis of foodstuffs, and most everything else. My laboratory contains an electrical rectifier which I have constructed from an article publisht in the ELECTRICAL EXPERIMENTER. I use this in working experiments in electrolysis, such as making potassium chlorat, sodium hydroxid, etc. I have constructed an electric furnace with which I perform experiments in making alloys and castings. My chemicals number about two hundred and fifty, including salts of most of the metals, and I have about one hundred and seventy-five pieces of apparatus. I have also constructed a large Oudin coil, the top of which can be seen under one of the tables. I have performed a great many interesting experiments in high frequency such as described in this magazine.—Theodore Fredrick, 924 Chicago Avenue, Evanston, Ill.



Science in Slang

By EMERSON EASTERLING

"I'M sure glad that station is up and going," remarked Stokes as we motored in from the power plant site.

"I saw a bunch of stuff in the cement houses," put in Punk, "but I'll be flopped if I can make it all out."

"It's more or less a long story," returned Jazz Stokes, "but I'll make it short as possible and still get you birds out of the dark on the subject.

We All Know that Tommy Edison Lost a Lot of Sleep Fiddling Around Over a New Kind of Illumination—the Electric Light. We Used Direct Current then But Nick Tesla Stept in and Gave us "Altering"—Excuse us —Alternating Current.

"We all know that Tommy Edison lost a lot of sleep fiddling around over a new kind of illumination—the electric light—back some years ago. Well, the next thing to do was to make it possible for the neighbors to have the product of his perspiration and inspiration, so he sticks up the primitive central station in the Knickerbocker Burg. The result is that one thing leads to another and now we have 'em all over the sphere.

"Back in the old days they used direct current. Then it was that Nick Tesla steps in and gets disgusted with the layout, kicks out the old stuff and pulls a new one on us. The stunt takes the form of *alternating current*. Nick gets his visionation working and pictures to himself—O, well, anyway he constructs a generator that fools the polarity indicator, and makes it possible for the generator to be farther away from the consumer and yet not have to strain itself to get the juice to the destination."

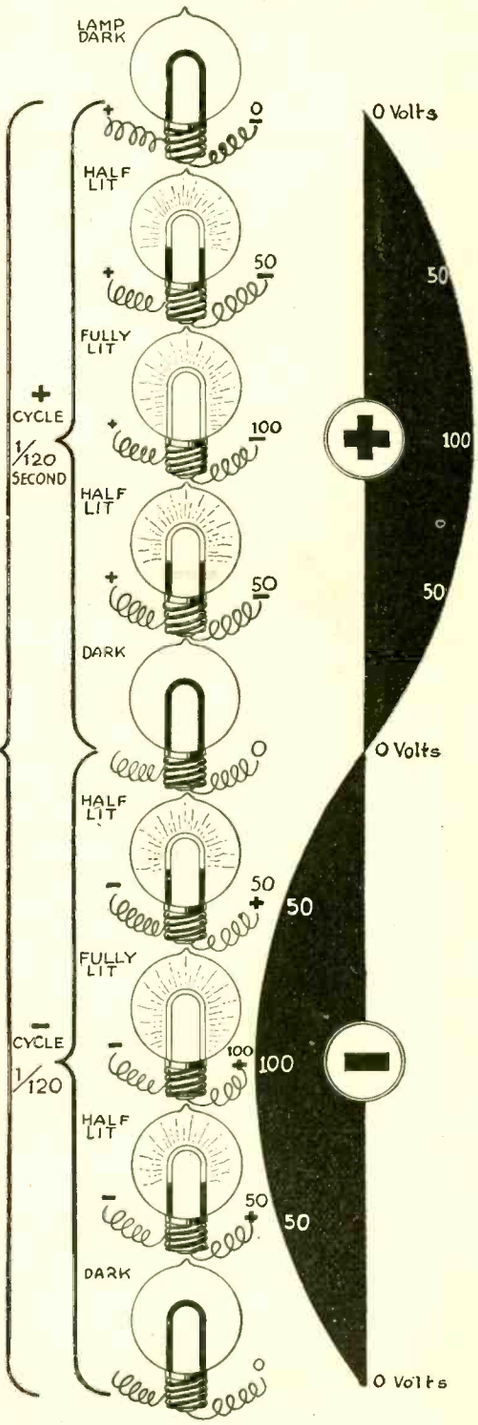
"How is all this?" asked Bender.

"It's this way," said Stokes, "this alternating current stuff was a new one on the public. The armature in the generator passes thru consecutively opposite magnetic fields and the current therefore goes shooting one way, croaks, and goes flopping back the other way. The speed and number of poles has to do with the frequency of the current.

"Here we put Mike Faraday's induction stuff to some real use. Mike found that if a current be made to pass thru (or over, which way he had it) a wire and another wire be placed parallel, a sort of sympathetic flow will present itself in the second wire; in the other direction. By winding many layers of wire around an iron core—for the iron core makes an easier path for the magnetic flux; the inductive flow is resultant from the induced magnetic field set up by the primary current—of both wires the result is found to be better than to lay the wires stretched out straight. It can be easily seen that the more concentrated flux would act more efficiently than the sparse flux that would course around the extended wires.

"It was found also that if the secondary be wound with smaller wire—more wire being used to make up the mass—that the voltage would be higher in the secondary. If the secondary be wound with larger wire the effect was found to be opposite. All this stuff worked out mathematically to a jot."

The Altering of the Alternating Current



"That all sounds like real spiel," sang out Bender. "But how is it that if the alternating current flops back and forth from positive to negative so many times a second, as you say it does, that we do not perceive any flicker in the incandescent gas bottles, better known as incandescent lamps?"

"Well, as I was going to say," continued Stokes, "several important things happen in producing radiant light from an incandescent lamp after the manner of Tommy Edison's invention. Probably the best way to understand just what happens in the incandescent lamp and why you do not see the flicker when the current pulsation does a one-step, and changes from positive to negative in the twinkling of an eye, is best shown by a drawing." Stokes then took a pencil and pad from his pocket and continued: "Here on the right we have an undulating line known as a *sine wave curve,* and which represents the rise and fall of a single phase alternating current thru two alternations, *or one cycle.* The current at a given instant starts from zero and rises to 50 volts, then 100 volts or 110, whatever it may be, maximum positive value; immediately afterward the positive current impulse starts down hill toward zero again, doing it very smoothly, yet with great speed. The juice makes a complete rise and fall thru *one alternation* or one-half cycle, in 1/120th of a second. Then it passes thru the *dead* or no-current point, also called the zero point, and starts to increase in strength, but in the *negative* (opposite) direction. These negative current pulses, running thru 1/120th second, pass thru the successive rise and fall potentials as you will see, reaching the end once more—this is called *one* cycle by electricians. A cycle comprises two alternations, or a complete reversal from positive to negative. By drawing the various degrees of illumination in the incandescent lamp at different stages thru the cycle, you will at once see how the filament rises from a *dark* condition at the start of a given cycle, increases in temperature and luminosity as the voltage increases thru the *positive* alternation, and finally becomes *dark* again as the current passes thru the first zero point. As the *negative* alternation starts to increase in potential in the next 1/120th second, the filament temperature again rises to a maximum with a consequent full luminosity, and then falls thru successive stages of brilliance until it becomes *dark* once more, as the current passes thru the second zero point at the end of a cycle. This action keeps up repeatedly."

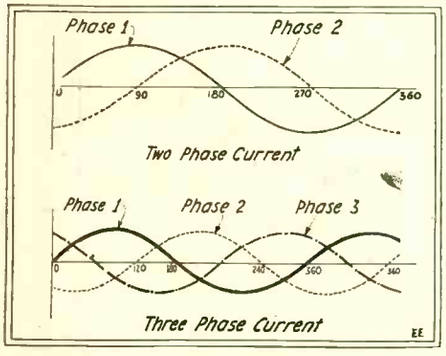
"Yes, that is all very fine," interrupted Bender, "but I don't understand yet, why it is that we do not see the lamp passing thru the dark periods in the cycles. One one-hundred twentieth second is not very fast, and the human eye is supposed to be one of the most wonderful high speed mechanisms in all Nature."

"I was coming to that," bawled Stokes, "if you would have allowed me another minute to catch my breath. Apparently you have forgotten some of your physics, Bender, and on second thought you undoubtedly will agree with me, if you will stop to remember that due to the *retention* of the 'image' on the rod and cone layer of the light sensitive portion of the eye, there is a peculiar action which takes place, causing the image thrown on this element of the eye to be retained for a short but quite appreciable period. Thus it is that

(*Continued on page 444*)

How an Incandescent Lamp Lights Up and Passes Thru the Half Cycle "Dark" Periods When Supplied with "Alternating Current." The "Dark" Periods Are so Short in Time "Duration" that the Eye Does Not Notice Any Flicker.

THE ORACLE



The "Oracle" is for the sole benefit of all electrical experimenters. Questions will be answered here for the benefit of all, but only matter of sufficient interest will be publisht. Rules under which questions will be answered:

1. Only three questions can be submitted to be answered.
2. Only one side of sheet to be written on; matter must be typewritten or else written in ink, no penciled matter considered.
3. Sketches, diagrams, etc., must be on separate sheets. Questions address to this department cannot be answered by mail free of charge.
4. If a quick answer is desired by mail, a nominal charge of 25 cents is made for each question. If the questions entail considerable research work or intricate calculations a special rate will be charged. Correspondents will be informed as to the fee before such questions are answered.

WHAT IS A POLYPHASE CURRENT?

(1020) Paul W. Meradith, Delavan, Ill., asks:—

Q. 1. What is a polyphase current?

Graphic Curves Showing Difference Between Two and Three Phase Currents. A Polyphase Current is One Comprising three or More Alternating Currents, Spaced Apart on the Time Axis in a Regular and Definite Ratio, Such as Here Illustrated.

A. 1. We must say that this is a very broad subject. You will do very well to consult your library and look up some good works on A.C. current. A very simple explanation, and one which you can readily understand is given in the book entitled, "Alternating Currents—Theory, Practice and Diagrams," by Horstmann & Tousley; also another very excellent work is that entitled "Alternating Currents," by Branch.

We give you herewith illustration showing the relation of the three distinct currents making up a three-phase polyphase system. The three-phase current may be transmitted by six wires or three wires, this system being the usual one in everyday practise. A polyphase current is one composed of two or more distinct, single-phase currents co-acting in a circuit in a certain particular relation to each other. In a two-phase system there are two alternating currents generated in two distinct windings in the alternating-current dynamo; one of these currents is 90 degrees ahead of the other. In a three-phase system there are, as the graph herewith shows, three separate alternating currents generated in three distinct windings on the rotor or stator, as the case may be, of the alternator, and each of these currents is 120 degrees ahead of the other. When one of these polyphase currents enters the windings of an A.C. motor, it sets up a rotating magnetic field of constantly changing polarity, as may readily be imagined, and this drags around the rotor, due to the fact that north and south magnet poles are induced in the iron poles of the rotor, which are repelled and attracted by the suddenly changing north and south magnetic poles of the stator in exactly the same manner as in a direct-current motor.

Your understanding on the subject of D.C. motors most probably makes clear the fact that if it were not for the commutator and brushes connected with the armature or rotor circuit of the D.C. motor, that it could never rotate, and the sole function of the commutator and brushes on such a machine is to suddenly change the polarity of the magnetic poles or fields surrounding the armature, as these poles approach the respective north and south poles of the stationary field.

WANTED!!!

"ODD PHOTOS" AT $1.00 EACH.

Here's what we want! What have you got?

ELECTRICAL PHOTOS—
New photos of Lightning; new and unusual Electrical Apparatus and Machinery; Electric Signs; Electric Autos; Electric Clocks.

SCIENTIFIC PHOTOS—
New Scientific Apparatus; Results; Effects; Motion Pictures; Stunts.

OPTICAL PHOTOS—
Peculiar stunts obtained with various lens arrangements; odd film effects caused by unusual conditions; novel micro-photographic subjects.

ASTRONOMICAL PHOTOS—
New eclipse photos; star and moon effects caught by the camera; comets; shooting stars; progressive moon studies; moon and star photos.

FREAK PHOTOS—
Odd double and triple exposure effects; novel and striking effects due to unusual exposures.

MECHANICAL PHOTOS—
Electrical and Mechanical apparatus of unusual news interest.

RADIO PHOTOS—
New stations, both commercial, government, and private. Owners of private or amateur stations will find a special contest for these photos on another page of this issue. And don't send us plate or film "negatives"; send unmounted or mounted "prints", preferably a light and dark one. Enclose stamps if photos are to be returned and place a piece of cardboard in the envelope with them to prevent mutilation.

Address photos to—Editor "Odd Photos", Electrical Experimenter, 233 Fulton Street, New York City.

ONE-INCH SPARK COIL.

(1021) D—— Brothers, East Lynn, Mass., writes:—

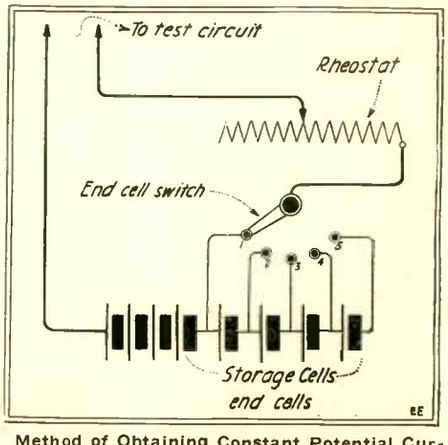
Q. 1. Asking for data on spark coil and underground antennae.

A. 1. Regarding data which you request on underground wireless, we would refer you to the June 1919 issue of the ELECTRICAL EXPERIMENTER wherein you will find a special article by H. W. Secor.

For size of coil which you wish to use with four cells of dry battery, we recommend the following:—

Core about 8 inches long, 1 inch in diameter, properly insulated with a fibre tube having about two to three layers of No. 14 D.C.C. magnet wire wound on same. Over these two or three layers of empire cloth and another insulating tube on top of this, wind about No. 38 S.C.C. magnet wire so as to make the coil about 4 inches in diameter when complete. The coil when operated will give about 1 inch spark.

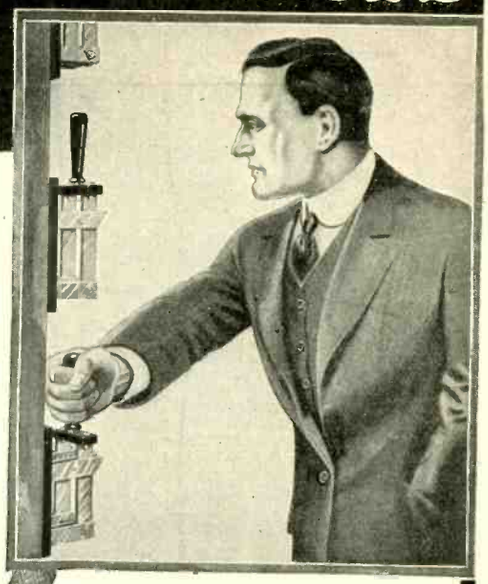
For information on the construction of spark coils, we would recommend a very excellent book, namely: "Design and Construction of Induction Coils," by Collins, $3.25 prepaid.



CONSTANT POTENTIAL TESTING CURRENT

(1022)) Oliver V. Austin, Ellisville, Miss., wants to know:—

Q. 1. How can I obtain an absolutely constant testing current from a storage battery?



A. 1. Would say that there is no ordinary method available, to our best knowledge, for maintaining a constant potential from such a source, except by means of a rheostat in the circuit, and also by the provision of a so-called *end-cell switch.*

An end-cell switch is a multi-point switch, connected at the end of the series of cells, and so arranged that as the voltage falls from the battery that other cells one by one can be switched in the circuit, and then the final graduations of potential are compensated for by means of a finely adjustable rheostat connected in series with the battery, as here illustrated.

Method of Obtaining Constant Potential Current from a Storage Battery by Means of an End Cell Switch.

Why Electrical Workers Are Needed.

Consider for a moment what part electricity plays in every-day life, in the comfort, convenience, pleasure and even health of the whole civilized world.

Think of having to ride in horse cars again—

of writing a letter every time you now phone—

of waiting days for what the telegraph does in a few minutes—

of no automobiles or moving picture shows—

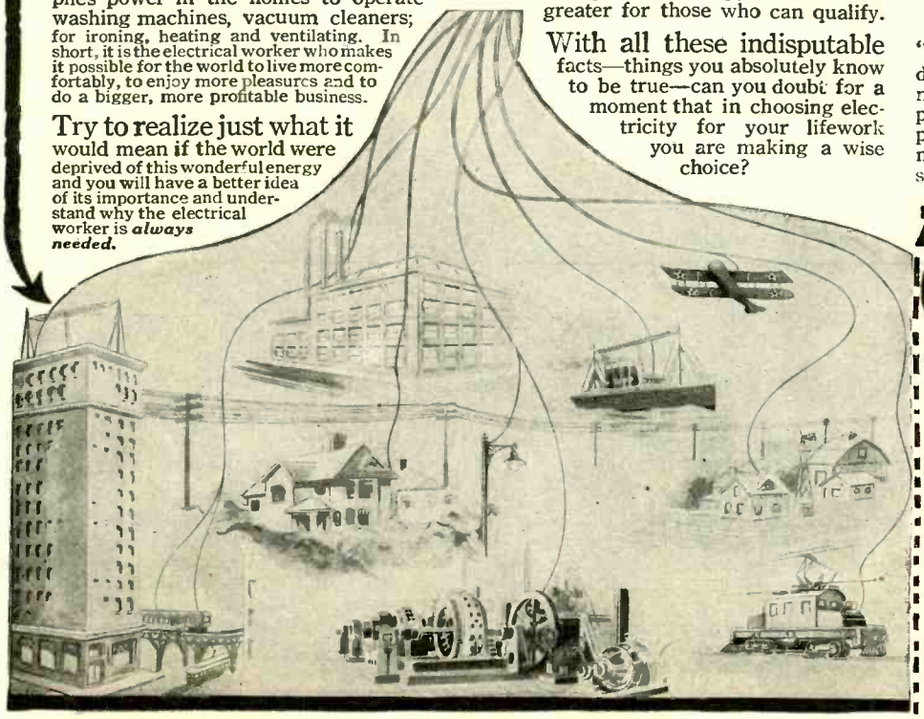
Electricity takes millions to and from work. Without it the automobile and airplane would be impossible—the telephone and telegraph would be useless. All the civilized world relies on it for light, heat, transportation and communication. In a thousand ways electricity is used in factories, offices and in the homes.

Electricity is almost as essential as the air we breathe. Business would be almost at a standstill if deprived of its energy.

To say that electricity is still in its infancy is no exaggeration. Every day brings into practical use some new method of controlling it, some new device or appliance for using it. In industrial work there are still scores of operations where electricity will be utilized sooner or later. The day is coming when the railroads will entirely replace steam with electricity. Doctors, dentists and scientists are only beginning to realize the possibilities af electrical energy.

These facts merely touch the high spots, yet they prove beyond a doubt that electricity plays a vital part in business, in our individual lives, and that there is unlimited scope for those who make electricity their life work.

The electrical worker provides other men light to work by, the telephone and telegraph to convey their orders, the power to run their machines and transport their goods. He supplies power in the homes to operate washing machines, vacuum cleaners; for ironing, heating and ventilating. In short, it is the electrical worker who makes it possible for the world to live more comfortably, to enjoy more pleasures and to do a bigger, more profitable business.



Try to realize just what it would mean if the world were deprived of this wonderful energy and you will have a better idea of its importance and understand why the electrical worker is *always needed.*

What Electricity Offers You

Once you have mastered the A-B-C of electricity you are confronted with unlimited opportunities for advancement. You can specialize in extending and perfecting the wonders already accomplished in the field. You may take up those branches of electrical and mechanical work which cover the design and manufacture of electrical apparatus or start in to qualify for a well-paid position in the designing, construction, operating or consulting branches of the electrical engineering profession, and to fit yourself eventually for a position as Distribution, Operating, Testing, Erecting or Designing Engineer.

In the automobile, airplane, telephone and telegraph lines there is also great scope for the trained electrician. Many wonders of electricity have yet to be unfolded—its uses multiplied—and opportunities still greater for those who can qualify.

With all these indisputable facts—things you absolutely know to be true—can you doubt for a moment that in choosing electricity for your lifework you are making a wise choice?

How You Can Qualify

You don't have to interfere with your present work while qualifying for a good electrical position. The American School can give you just the training you need in your SPARE TIME. Our electrical courses have been specially prepared for home study—are written so you can understand everything quickly—and from your first lesson until you get your Diploma expert instructors coach you. Our training will enable you to get into the game RIGHT.

Read This Guarantee —Then Act

"We guarantee at any time during the first year of your enrollment to refund the entire amount paid if, immediately upon the completion of ten examinations, you notify the School that you are not satisfied with your course."

Experimental Mechanics

By Samuel D. Cohen

(Continued from page 423)

favor with all users of reamers. The eccentrically relieved reamer is purely a finishing reamer, and cannot be used with advantage to remove any considerable amount of metal. When hand reamers are used merely for the purpose of removing stock, or simply for enlarging holes, the flat relief will undoubtedly prove to be superior to the eccentric. The primary use of straight hand reamers, however, is for producing holes true to size and smoothly finished, removing meanwhile but a small amount of stock. For this purpose nothing excels the eccentric relief. That there are a number of different classes of reliefs required, according to the use to be made of the reamer, is best proved by the fact that while some manufacturers of tools relieve their reamers eccentrically, intending them to be used as finishing reamers, some of their customers place them in a grinding machine and replace the eccentric relief with a flat one, because they find this relief better for their purpose, viz., simply enlarging holes irrespective of the highest requirements of accuracy and smoothness.

A regular cutter and reamer grinder is often used for grinding reamer teeth. See Fig. 5. Another method is to utilize an electric grinder held in the tool post of a lathe, while the reamer is held between the lathe centers. The most economical and best results are obtained when using a grinding machine, made for this purpose. The sharpening or backing off of reamers in a lathe is unsatisfactory and should never be resorted to unless no other means are at hand. Sometimes it happens that a large reamer must be sharpened, the diameter of which is either too long or too short for the capacity of a grinder. In such a case the electric grinder used in a lathe will prove satisfactory. Of course, from the experimenter's point of view, the only means at hand for him to grind his reamers will be the lathe and electric grinder.

The amount of clearance that a reamer tooth should have depends largely upon the class of reamer and its size. A suitable clearance for reamer teeth, exprest in degrees (the face of the tooth being radial), is not a fixt number, but varies for different diameters, and the smaller the reamer the greater the angle of clearance should be. Hence, if the cutter and reamer grinder are set to grind the right amount of clearance on a large reamer, a smaller reamer would not have a suitable clearance at that setting.

How the R-34 Crost the Atlantic

(Continued from page 404)

fying audion and sending outfit he has been able to send and receive a distance of 1,200 miles by actual test, he being off the coast of the Azores at the time, communicating with the British Air Ministry at London. The auxiliary outfit is capable of sending 800 miles. In addition to this there is an ordinary spark coil outfit, utilizing but a small amount of current, which has covered a range of 300 miles. This seems rather unique, inasmuch as it is seldom that small spark coil outfits ever cover such a great distance. But according to Lieut. Durrant, it is a fact, and is recorded in the ship's "log." In addition to these outfits there is a "Wireless Telephone" instrument device, which can be connected to the auxiliary wireless outfit, and when so connected, forms a part of this auxiliary outfit, by means of which wireless telephonic communications have been sent and received while in flight.

In back of the Radio Room is the engine room of the forward gondola. This, like the other gondolas, contains a high-powered gasoline engine, which, however, is greatly geared down, the power of each motor being about 275 H.P. An oiler and a mechanic are in charge of these engines constantly, both day and night. Amidships are two gondolas, each of them containing an engine and its respective propeller. The rear gondola has two such engines geared to a single propeller so that either one or both may be operated at the same time. Energy for electric lights is derived by special dynamos each connected to an engine; these dynamos furnish the light for the respective gondolas, and are connected in such a way as to allow any one of them to furnish the electric current thruout the entire ship if necessary. The energy for the wireless station is derived from the main engine. From each gondola there is an aluminum ladder enclosed in a fabric, which leads up into the interior of the blimp. These ladders connect into a passageway so that men aboard the airship may pass from one gondola into another. In the center of the airship there is a large room 20 feet long by 8 feet wide, in which the crew eat, their meals being cooked over the exhaust pipe of the engines. Strange as it may seem the men had bacon and eggs for breakfast on the first day out, cooked as above mentioned on the exhaust pipes of the engine. This shows the terrific amount of heat that these engines, because of their combustion, furnish. Hence each engine has connected with it a very elaborate system of radiators in order to cool it. These radiators are placed above the gondolas as shown in the illustrations.

In the center of the ship there is a runway covered with linoleum, as already mentioned, stretching almost thru the entire length of the keel, i. e., about 600 feet long, and only 9 or 10 inches wide, which the crew use for exercising and for passing from one gondola to another. Should one member attempt to pass the other, either one of them must lean against the aluminum frame-work of the dirigible, so as to allow the other to pass. Should they fail to do this, a drop of about 8,000 feet into the briny deep would result. There is plenty of room to walk upright, the roofs of the gas bags above being about 12 feet from the runway. The gas bags are divided into eighteen separate envelopes, which are inflated with hydrogen, nine of these being equipt with automatic valves so that expanding gases due to changes in temperature may escape. All the bags are incidentally equipt with gages, which register the pressure of gas and are inspected hourly. The hydrogen bags are made of calves' intestines (goldbeater's skin). There are sixteen gasoline tanks attached to the frame-work on either side of the runway, each with a capacity of about 70 gallons, forming a total weight when filled of about 500 lbs. There are forty-nine of these tanks aboard the gondolas and thirty-two in the ship, making a total of eighty-one, more than half of which can be thrown overboard to lighten the craft in case of emergency, which is absolutely necessary inasmuch as there is no way of refilling the

(Continued on page 440)

Be a Draftsman
Raise Your Income

Get into this paying profession and have positions opened to you by manufacturers, architects, railroads, contractors—by every kind of a corporation where mechanical design and construction are carried out. Draftsmanship puts you in the class of specialists, raises you above the crowd of job hunters, makes you a man whose services are needed.

You have the same opportunity to get the training that other men had who took the Chicago "Tech" Course in Draftsmanship and are now drawing large salaries and holding important, responsible positions. You also can learn how to earn

$25 to $100 a Week

Not enough really skilled draftsmen are available to fill the places open now. All you need is training to be prepared to answer the call that will mean more money for you. Begin your training without delay. Don't waste time waiting. The Chicago "Tech" experts are ready today to give you the thorough, practical instruction which will enable you to step into the drafting room of some big organization prepared to do the kind of work that earns high salaries and leads to advancement. At least write. Mail the coupon below or a letter stating which branch specially interests you.

Drawing Outfit
(No Extra Charge)

Every student of the Chicago "Tech" Home Study Course in Draftsmanship receives this drawing outfit—set of instruments in case, drawing board, T square, triangles, scale, curve, drawing paper, pencils, etc. or a cash credit in case he already has an outfit. These instruments are of the same make and sizes as used by high salaried experts in drafting rooms of factories, shops, railroads, etc. You use them while learning — then take them right into your practical work.

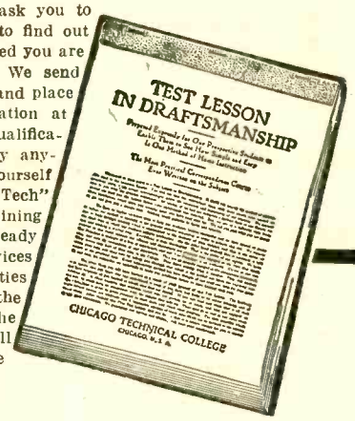
Come to Chicago "Tech" OR TRAIN AT HOME

Chicago "Tech" has its students everywhere. If you can't come to Chicago, take the Home Study course. The same professors who direct the resident courses will teach you by mail. You will have their personal direction, you will learn the most modern methods—all this while holding your present job. We train hundreds of ambitious men—and see them quickly rise to success. You therefore need not be denied this technical education. Sign and mail the coupon.

Get Practical Training from Practical Men
NO TIME PUT IN ON NEEDLESS STUDIES

Enrollment with Chicago "Tech" means getting direct personal instruction from men who for years have planned and directed big architectural and engineering work in leading cities. They have weeded out useless theories and needless studies and will give you the kind of instruction which will enable you to work beside the most experienced men.

That is one reason why you can get a complete, thorough technical training here in such a short time. Also the reason why Chicago "Tech" men are in such great demand. They go into work prepared to give the kind of service wanted.



This is the training you are offered either at the college or by mail. And this is the time to enroll when there is such a pressing need for highly trained draftsmen. Use your spare hours to fit yourself for a bigger salary—a more important position. Chicago "Tech" offers you the opportunity. WRITE.

EASY PAYMENTS

Low tuition fees and easy terms of payment. Pay as you go along. Get training which will soon repay in extra earnings all the cost of the course. You know the salaries received by skilled technical men today. Get information on the opportunities which you opened wide to you by Chicago "Tech". We will give you all this information about fees, terms, etc., and send testimonials from Chicago "Tech" graduates on how they have profited from our instruction, if you will send the coupon.

FREE TEST LESSON

Other institutions ask you to pay first—and then to find out later how well qualified you are for this profession. We send the free lesson first and place you under no obligation at all. Discover your qualifications before you pay anything. And see for yourself just what Chicago "Tech" offers you in training which will bring a ready market for your services and open opportunities which are closed to the untrained man. The coupon will bring all the facts about the course, the small fee, and the easy terms.

Auto and Gas Engine Course

All about automobile mechanism—its construction, operation and REPAIR—taught by mail. You train directly under the Chicago "Tech" automobile experts. Learn all about Principles of the Automobile, all about Gas Engines, Power Plants, Transmissions, Lubrication, Cooling, Batteries, Starting and Lighting Systems, etc.

KNOW HOW TO FIX TROUBLES

Most complete instruction in auto repair work. Equips you for high pay or to start a business. Big demand for trained repair men.

Aeronautics

Complete, practical instruction in Aeronautic Engineering. Every principle made clear. Construction of every type of machine fully explained. This course equips you for expert work. Get the catalog and information. Send coupon.

WRITE

Below we list our principal courses in Drafting and several others. Just mark X in the [ ] to show which course interests you and we will send catalog and information about that particular subject. If in doubt about yourself, tell us your ambitions and we will advise you. Sending this coupon may mark a turning point in your career. May lead to a larger measure of success than you have expected. We can train you as we have trained others. Send the coupon today.

AMAZING SUIT OFFER!

$17.50

Tailored to Your Measure

Yes—a real $27.50 suit cut and made TO YOUR INDIVIDUAL MEASURE—tailored with all the skill and style that only the best custom tailors can give. Price only $17.50. Finished with highest grade trimmings and linings—the kind that wear and give satisfaction. A special proposition to introduce to the readers of this magazine the wonderful values offered by our system of tailoring. Nothing else like it—no values to equal it.

Our Plan Saves You $10

We have no agents, no dealers, no traveling salesmen. Our catalog is our only representative. Our plan saves $10 or more on every suit and gives you real individuality in your dress. A wonderful selection of fancy wool worsteds, cassimeres and all-wool BLUE SERGES, AT UNHEARD-OF LOW PRICES.

Send only $3.00 and your measurements, with cloth selection made from our catalog. We will make the suit to your measurements and you pay balance on arrival. We take all the risk, you none, for this is our guarantee: Complete satisfaction or all money refunded.

FREE Book of Styles and Cloth Samples

Our big, new Fall and Winter Book is ready for you—contains samples of latest woolens; also lowest prices on men's hats, shoes and furnishings. It is your guide to correct and economical clothes buying. Write, mentioning this publication so we can identify this special offer.

bags with hydrogen while at sea. There are three immense drinking water tanks and several water ballast tanks which may be opened to lighten the airship. Everything inside the ship is balanced to perfection, tank for tank, hammock for hammock, and parachutes and life belts for parachutes and life belts on either side. The men eat and sleep in shifts. They sleep in hammocks made of Italian hemp, which are strung from one aluminum strut to another; there are ropes to tie oneself in with. There are ten of these hammocks, three forward, three aft, and two on each side amidships. Two aluminum ladders are connected with the forward and rear gondolas leading between the hydrogen balloonets to the top of the dirigible, where a cockpit opens to the external atmosphere by means of which the observer, taking care not to attempt to stand on the roof while the ship is in motion, takes a "shot" at the sun.

No leather shoes are worn by any of the men around the vessel in order to avoid jarring. Nor are matches allowed inside the envelope at all, everyone using flashlights equipt with miniature electric storage batteries. Inside the ship are found some of the comforts of home, the crew having brought two phonographs to America with them and returning with a third, presented by Mr. Thomas A. Edison. By jabbing a needle into Caruso, they heard him yell all night. In other words, these phonographs were kept going constantly. Lieutenant Durrant asked us not to forget to mention the mascot, a small maltese cat named "Jazz," which he is sure brought them luck on both the journey to America and back home again.

THE AIRSHIP IN MOTION.

The ship is 672 feet long and 150 feet beam at its maximum diameter. The ladders leading to the top are approximately 80 feet high. In order to start the vessel, its moorings are loosened, after which the ship swiftly drifts upward to about 8,000 or 9,000 feet. At this level an equilibrium is establisht and the engines are then started, when the ship proceeds on its course. The speed of the vessel is approximately 49 knots per hour when under full swing with no unfavorable winds, and the men on duty remain at their posts for about four hours, after which they are relieved by another section. For every thousand feet that the dirigible ascends, it loses 1/30th of its volume of gas, and in very heavy foggy weather naturally its normal position would be much nearer to the earth's surface, due to the fact that with a heavier atmosphere it would not be as buoyant.

The ocean viewed from this wonderful craft appears to be a vast blue stretch of prairie, beautifully streaked with green, which is visible thru the rifts in the clouds; every now and then a long white streak forms and rolls along rapidly. Wave motion is not visible at all, but the foam turned up by the wave as it breaks is distinctly noted as the white line of which we have just spoken. On preparing to land, the hydrogen is not allowed to escape, as so many think. The blimp's propellers are kept in constant motion and its rudder is tilted so as to make a nose dive at about a 45 degree angle. Sweeping around the field several times and preparing for a landing place, the vessel comes nearer and nearer to the ground. When all is ready a heavy cable is thrown out from the forward gondola which willing hands immediately grasp, and in addition to this some water ballast is thrown out, giving the landing crew a nice ducking.

While at Mineola, Long Island, the airship was anchored to huge concrete blocks, but because of the terrific resistance such a large body offers to a gust of wind, it broke loose from its moorings, a large hole being torn in its outside envelope. This was repaired in short order, and after that the balloon was held under control by a number of United States soldiers who swung the balloon like a weather vane, so that it continually presented a streamline effect and never broadside to the wind. In this way it was handled for the rest of its stay with no mishap.

An American army portable electric generating station furnished electric current for the searchlights scattered thruout the field, and current for operating the electric gasoline pumps to fill the tanks in the R-34. This outfit represents the latest army type of portable generator, giving about 110 volts and 125 amperes direct current.

Sir William Crookes' Psychical Researches

By Hereward Carrington, Ph. D.

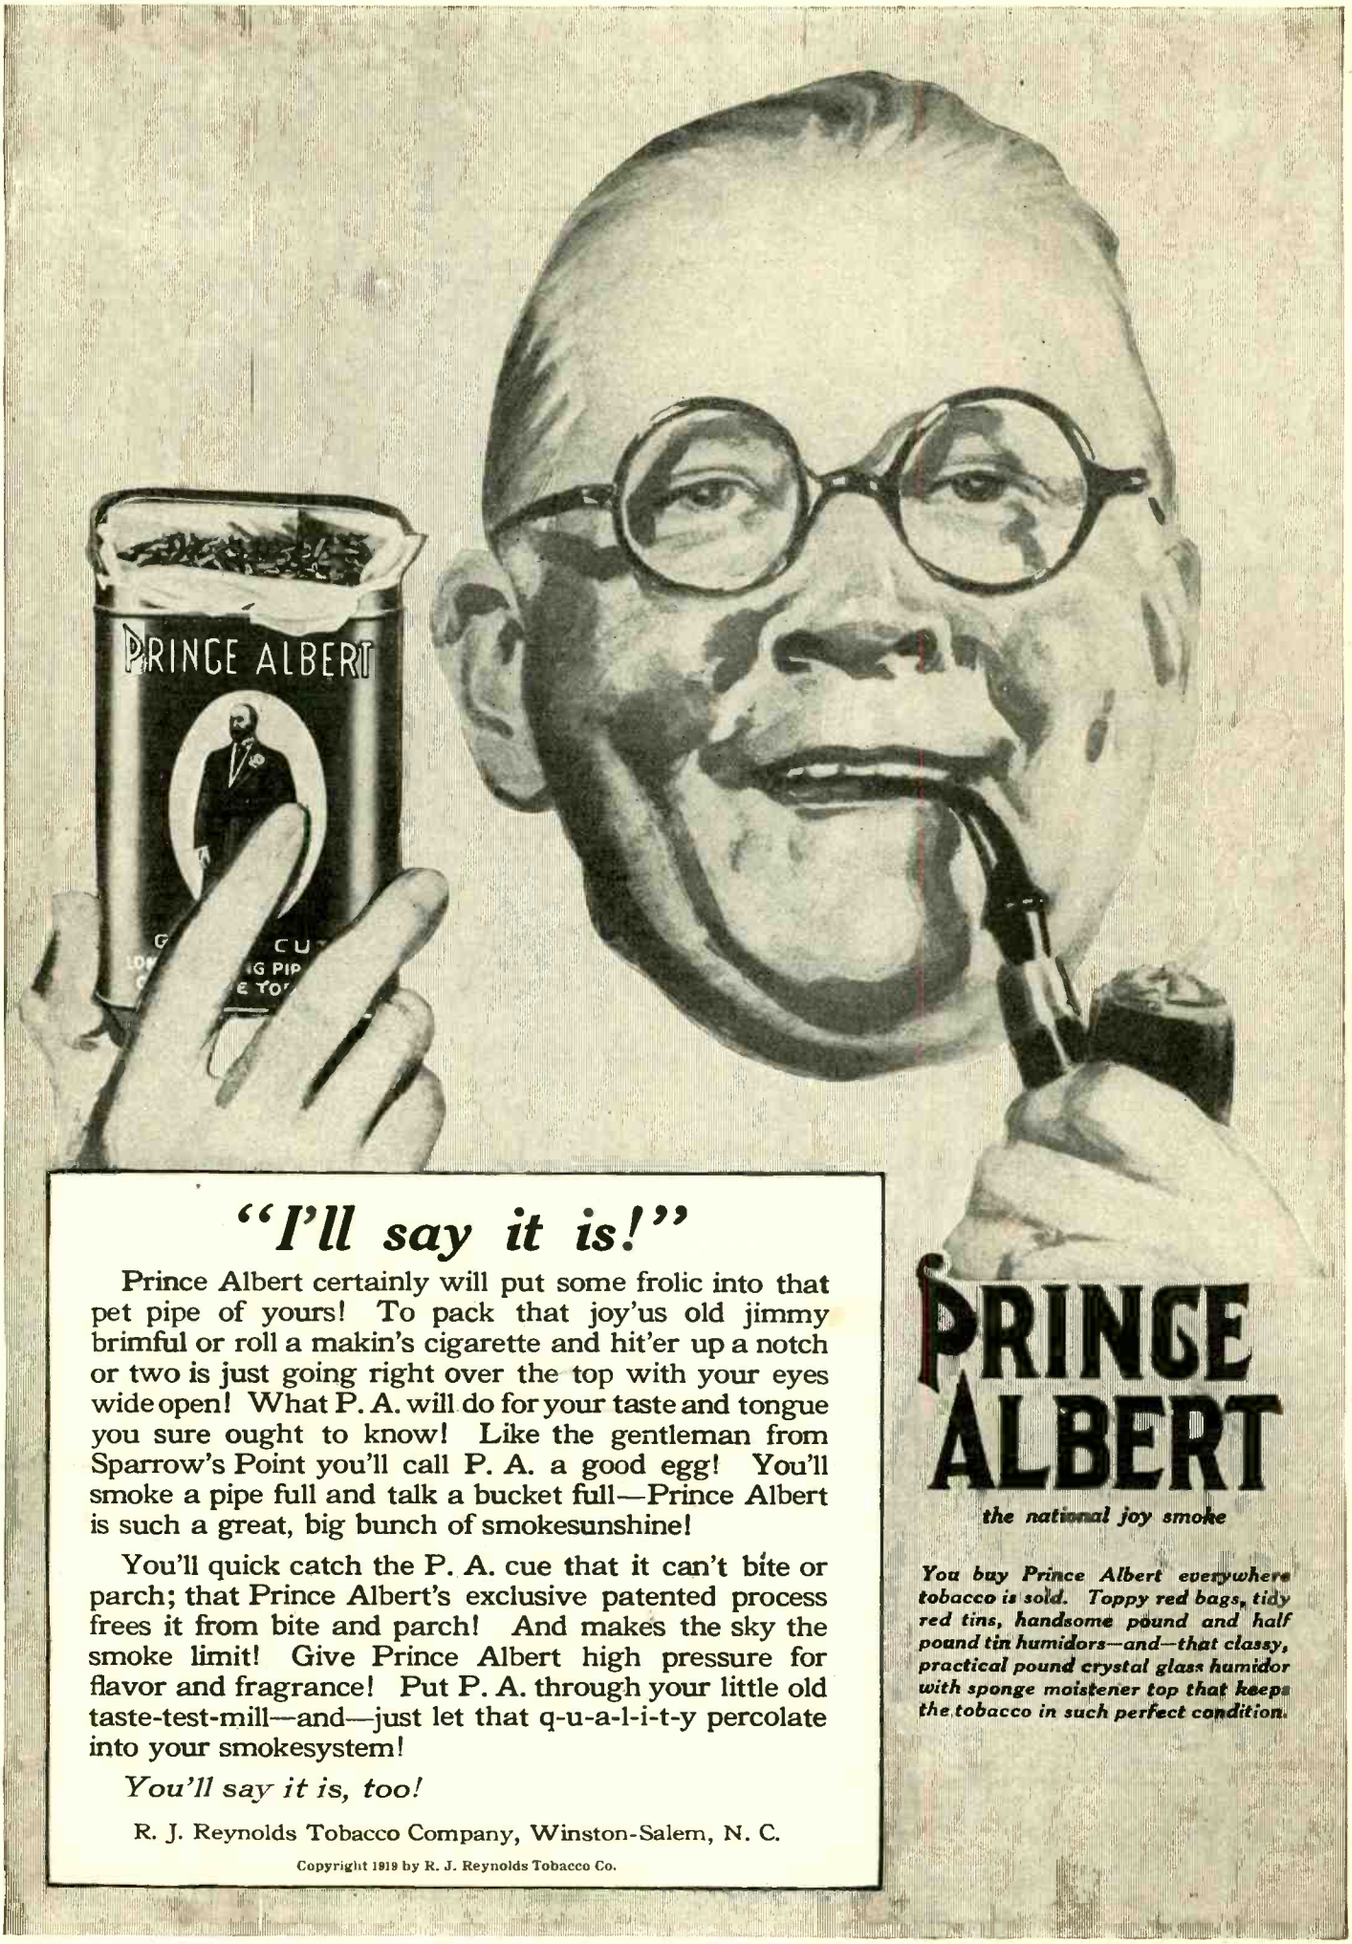
with electricity, and of such a height that it would just fit under the table (see illustrations). Writing of these experiments, Sir William says:



"Mr. Home took the accordion between the thumb and middle finger on one hand at the opposite end to the keys. . . . Having previously opened the brass key myself, and the cage being drawn out from under the table so as just to allow the accordion to be pushed in with its keys downwards, it was pushed back as close as Mr. Home's arm would permit, but without hiding his hand from those next to him. Very soon the accordion was seen by those on each side to be waving about in a somewhat curious manner: then sounds came from it, and finally several notes were played in succession. Whilst this was going on, my assistant looked under the table, and reported that the accordion was expanding and contracting, and at the same time it was seen that the hand of Mr. Home, by which it was held, was quite still—his other hand resting on the table.

"Presently the accordion was seen by those on either side of Mr. Home to move about, oscillating and going round and round the cage, and playing at the same time. Dr. A. B. now looked under the table, and said that Mr. Home's hand appeared quite still, whilst the accordion was moving about, emitting distinct sounds. . . . But the sequel was still more surprising, for the medium then removed his hand altogether from the accordion, taking it quite out of the cage, and placed it in the hand of the person next to him. The instrument then continued to play, no person touching it and no hand being near it."

When Home had hold of one end of the accordion, Sir William Crookes took hold of one of the medium's wrists, and found that *he was not moving a muscle.*

The next experiments were those with a "spring balance." A mahogany board, 36 inches long, was suspended at one end to a balance, supported by a firm tripod stand. See illustration herewith. Any downward pressure upon the board was therefore registered by the spring balance. The other end of the board rested upon a knife-edge fulcrum on a solid table, and directly over the center of the fulcrum was placed a large glass bowl filled with water. Over this, in

"I'll say it is!"

Prince Albert certainly will put some frolic into that pet pipe of yours! To pack that joy'us old jimmy brimful or roll a makin's cigarette and hit'er up a notch or two is just going right over the top with your eyes wide open! What P. A. will do for your taste and tongue you sure ought to know! Like the gentleman from Sparrow's Point you'll call P. A. a good egg! You'll smoke a pipe full and talk a bucket full—Prince Albert is such a great, big bunch of smokesunshine!

You'll quick catch the P. A. cue that it can't bite or parch; that Prince Albert's exclusive patented process frees it from bite and parch! And makes the sky the smoke limit! Give Prince Albert high pressure for flavor and fragrance! Put P. A. through your little old taste-test-mill—and—just let that q-u-a-l-i-t-y percolate into your smokesystem!

You'll say it is, too!

PRINCE ALBERT

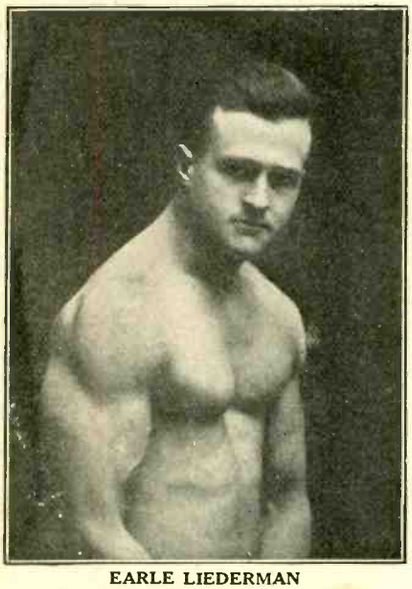
the national joy smoke

You buy Prince Albert everywhere tobacco is sold. Toppy red bags, tidy red tins, handsome pound and half pound tin humidors—and—that classy, practical pound crystal glass humidor with sponge moistener top that keeps the tobacco in such perfect condition.

Be a Real Man!

LOOK LIKE ONE AND FEEL LIKE ONE!

BROADEN YOUR SHOULDERS, DEEPEN YOUR CHEST, ENLARGE YOUR ARMS, AND GET A DEVELOPMENT THAT WILL ATTRACT ATTENTION. FILL YOURSELF FULL OF ENERGY AND BE POWERFUL



What's the use of merely existing, when you can improve yourself to such an extent that life will become a pleasure.

You don't know what life is unless you are an athlete.

If you are weak, run down, mentally and physically, if you lack ambition or feel discouraged, if you have suffered from youthful errors, or dissipations of later years, if you are bothered with indigestion, constipation, worry, kidney trouble, or any like ailment, *brace up*, and **START IN ANEW, AND MAKE THE MOST OF YOURSELF.**

I can do for you what others cannot attempt to begin to do, because my methods are original with me.

I BEGIN WHERE OTHERS LEAVE OFF.

EARLE LIEDERMAN
The Acme of Physical Perfection

I have trained some of the world's strongest men. If you will let me train you, I can give you a *wonderful muscular development* and great strength as all my pupils have.

I PRACTICE WHAT I PREACH. By my own original methods I developed myself. I keep myself fit.

To make others fit, an instructor should first be fit himself. If an instructor cannot keep himself fit, what good are his methods of training?

HAVE YOU RECEIVED A COPY OF MY NEW BOOK "MUSCULAR DEVELOPMENT"? If you have not as yet read this interesting book, by all means send for a copy. It is handsomely illustrated with 20 full page photographs of myself and some of the finest developed athletes whom I have trained. This book describes my system and you will find it intensely interesting. Send me 10c, stamps or coin, and I will mail you a copy promptly. Simply tear off the coupon below and mail to me with 10c. Do this right now, at once, before you forget it.

EARLE E. LIEDERMAN
Dept. 212, 203 Broadway, N. Y. City

EARLE E. LIEDERMAN,
203 Broadway, New York City.

Dear Sir:—I enclose herewith 10c for which you are to send me, without any obligation on my part whatever, a copy of your latest book "Muscular Development." (Please write plainly.)

Sir William Crookes' Psychical Researches

By Hereward Carrington, Ph. D.

(*Continued from page* 440)

turn, but quite detached from it, being separately supported, was a metal cup, perforated, so as to allow the entrance of the water. The board, thus suspended, weighed six pounds.

It will be observed that by placing the fingers in the metal bowl no added weight was imparted to the board, since this would serve only to displace a small amount of water, which would be registered equally on both sides of the fulcrum.

Mr. Home was asked to place his fingers in the metal bowl, in the water, without touching anything, and requested to *will* the emission from his fingers of the "psychic force," in order to register a depression of the opposite end of the board near the spring balance. He did so, his hands and feet being carefuly guarded (all these experiments being in good light). *A pull of about* 5,000 *grains was registered!* In a number of subsequent experiments, even stronger pressures were measured, which results were permanently recorded by means of a needle, making a graphic tracing of the various depressions and oscillations of the board. The manifestation of some kind of "psychic force" thus seemed to be establisht.

These, however, were but the simple, initial experiments undertaken by Sir William Crookes, which proved to him the reality of "psychic phenomena." His subsequent researches were most striking, including such manifestations as the *levitation or floating in space of the medium's body; the elongation of his body; the movements of objects without contact; playing upon musical instruments without any human hand being near him; the handling of red-hot coals without injury to the medium, and finally (with the medium Florence Cook) full-form materializations, which were seen and photographed by Sir William Crookes, and proved by him to be independent beings, separate from the body of the medium.* Sir William thus enumerates the phenomena witnest by himself:

The movement of heavy objects without contact; raps; the alteration of weight of bodies; movements of heavy substances at a distance from the medium; levitations of tables and chairs, without contact; the levitation of human beings; luminous appearances (lights); the appearance of hands; direct writing; phantom forms and faces; various phenomena indicating intelligence other than that of the medium.

Regarding, for instance, *levitation,* Sir William Crookes says:

"On one occasion I witnest a chair, with a lady sitting on it, rise several inches from the ground. On another occasion, to avoid the suspicion of this being in some way performed by herself, the lady knelt on the chair in such manner that its four feet were visible to us. It then rose about three inches, remained suspended for about ten seconds, and then slowly descended. . . . The most striking cases of levitation which I have witnest have been with Mr. Home. On three separate occasions have I seen him raised completely from the floor of the room. Once sitting in an easy chair, once kneeling on his chair, and once standing up. On each occasion I had full opportunity of watching the occurrence as it was taking place. . . . There are at least a hundred recorded instances of Mr. Home's rising from the ground, in the presence of as many separate persons, and I have heard from the lips of the three witnesses to the most striking occurrence of this kind—the Earl of Dunraven, Lord Lindsay and Captain C. Wynne—their own most minute accounts of what took place. To reject the recorded evidence on this subject is to reject all human testimony whatever, for no fact in sacred or profane history is supported by a stronger array of proofs.

"The accumulated testimony establishing Mr. Home's levitations is overwhelming. It is greatly to be desired that some person, whose evidence would be accepted as conclusive by the scientific world—if, indeed, there lives a person whose testimony *in favor* of such phenomena would be unequivocally taken—would seriously and patiently examine these alleged facts. Most of the eye-witnesses to these levitations are now living (at that time), and would, doubtless, be willing to give their evidence. But in a few years such direct evidence will be difficult, if not impossible, to be obtained. . . ."

Other phenomena recorded by Sir William Crookes regarding the mediumship of Home are still more wonderful. For instance, on a number of occasions, *Home took live coals from the fire, held them in his bare hands, and blew on them until the flames licked between his fingers, and the coal could be seen burning with a fierce heat in his hands.* On several occasions Home asked one of his sitters to touch the coal to assure himself it was hot; he did so, with the result that a large blister was at once raised on the hand. On other occasions, however, Home would apparently communicate his "preternatural incombustibility" to one of the sitters. He would say, "*Now,* touch the coal!" and they would be enabled to do so with the same impunity as Home himself. These phenomena—incredible as they may appear—were vouched for by many witnesses, including Sir William himself, and seem to be among the best-attested of Home's phenomena. The only analogy we have is the so-called "fire walking ceremony" performed in India, Japan, the Fiji Islands, etc.—if we leave out of consideration the historic case of Shadrach, Meshach and Abednego!

Doubtless the most striking tests undertaken by Sir William Crookes, however, were those made with the medium, Florence Cook. These manifestations took place in Sir William's own home—usually in his laboratory—and were of the order of *full form materialization.* Florence Cook, the medium, would enter the cabinet, and apparently go into a state of deep trance. The room being in complete darkness, a white-robed spirit form, claiming the name of "Katie King," would emerge from the cabinet and be seen by the sitters—at times carrying on a conversation with them. Naturally, the question at once comes into the mind: Was fraud possible in this case? Was a confederate employed, or could the medium herself have played the part of the materialized spirit?

It may be taken as certain that no confederate was employed. The tests were conducted, as stated, in Sir William Crookes' own laboratory, and the doors were securely locked before the séance began. No; if any fraud was possible at these times, the medium herself was responsible for it. Could the medium have played the part of "Katie King"?

Writing of this, Sir William says:

". . . Katie is half a head taller than Miss Cook, and looks a big woman in comparison with her. In the breadth of her face she differs essentially in size from her medium, and the photographs show several other points of difference. . . .

"I have the most absolute certainty that

Which Job Do You Want?

NOT one of these jobs is beyond your reach. You can have any one you want. The big pay that goes with it is yours, too. A little ambition and some training that you give yourself at home is all you need. You don't have to serve an apprenticeship. You don't have to go to school. American Technical Society Home Study Books and a little spare time will quickly fit you to hold any kind of job. If you haven't the necessary "know how" to put you in the big pay class, make up your mind to get it right now. Pick out the job you want and send the coupon for the books that will fit you to hold it.

Some of the greatest experts in the world prepared these books just for you—to help you get ahead. They are written in plain, everyday, good old U. S. language, just like you and I talk. No big technical terms—no trouble to understand them. Hundreds of pictures and diagrams in each set help to make difficult things as simple as A. B. C.

Doctor of Chiropractic
SUCCESS
Implies Health, Wealth, Happiness

All of these desirable and necessary conditions to a life of success can be attained thru CHIROPRACTIC.

However, to attain success in any important profession requires thorough preparation thru RESIDENTIAL INSTRUCTION. Chiropractic is rapidly gaining recognition in every state and only graduates of Standard Schools and Colleges are allowed examinations. Correspondence courses are inadequate to meet the requirements, therefore, the road to success in Chiropractic leads thru residence courses only.

Length of course, tuition cost are yet moderate.

Sir William Crookes' Psychical Researches

By Hereward Carrington, Ph. D.

(*Continued from page* 442)

Miss Cook and Katie are two separate individuals, so far as their bodies are concerned. Several little marks on Miss Cook's face are absent on Katie's. Miss Cook's hair is so dark a brown as almost to appear black; a lock of Katie's, which is now before me, and which she allowed me to cut from her luxuriant tresses, having first traced it up to the scalp and satisfied myself that it actually grew there, is a rich golden auburn. . . .

"One evening I timed Katie's pulse. It beat steadily at 75, whilst Miss Cook's pulse a little time after was going at its usual rate of 90. On applying my ear to Katie's chest, I could hear a heart beating rhythmically inside, and pulsating even more steadily than did Miss Cook's heart when she allowed me to try a similar experiment after the séance. Tested in the same way, Katie's lungs were found to be sounder than the medium's, for at the time I tried my experiment Miss Cook was under medical treatment for a severe cough. . . . ."

Sir William Crookes also took a number of flashlight photographs of Katie—one showing her standing beside him, and one showing Miss Cook, entranced, in the cabinet, with Katie, the materialized spirit, beside her. These phenomena, incredible as they may appear, were nevertheless seen and testified to by a large number of responsible people, and were observed by Crookes himself for many weeks consecutively, and tested in every way possible. These phenomena are among the most extraordinary in the whole history of spiritualism—the most incredible, *and the best attested!* What are we to think of them? That is the question which has been asked for the past half century, and which still remains unanswered! They are the most startling manifestations which Sir William Crookes reported, and will remain forever associated with his name.

In the next issue, "Apparatus Used in Exposing Fake Spiritualists." Another interesting discussion by Dr. Carrington.

Science in Slang

By Emerson Easterling

(*Continued from page* 435)

the eye tends to retain an impression of the filament at full or nearly full luminosity, while the current passes thru zero and the temperature of the filament proper decreases rapidly toward zero. Hence, before the image of the illuminated filament thrown on the eye is lost, insofar as its effect on the optic nerve is concerned, the current and filament temperature has past safely thru the zero point of the style, and started to rise again on the reversed current pulse of the cycle, as I showed you previously.

"As high voltage currents transmit with more efficiency and low voltage currents are more conducive to longevity when placed within reach of the uninitiated consumer, it was found that alternating current would have to neither be partial to the transmission nor the consumer, so the juice peddlers stick in the A. C. generators and hang pots (transformers) to step up the juice for better transmission, and then step her down for the consumers' better health, disregarding the undertakers' scowls."

"That is a pot," Bender said, pointing to a cast iron object on an electric light pole, and looking over at Jazz to see if he was going to censure the statement.

"Yes," replied Punk, "I have noticed them on a number of telegraph poles."

"There is a funny thing," laughed Stokes, "to the general public a pole is a pole—whether telephone, telegraph, light, or power. There is as much difference as there is in nigger, chink, white, or Eskimo. One of the most apparent differences would be found out if you should happen to try to tap in on a high tension transmission line to get the Tia Juana results."

"How is the stuff worked?" asked "Bonehead" Florey. "How is the juice sent from the station where the stuff is manufactured to the kitchen range or cigar lighter?"

"The stuff is first stept up, as I said, then it is stept down somewhat by a substation, generally in the outskirts of the village that the juice is being pumped into. The idea is that 4,000 volts is less likely to cause a massacre if the lines blow down than 66,000, 33,000, 20,000, or the like; so they step it down. Four thousand will transmit the distances from most substations with more efficiency than would the higher voltages—they figure that the line loss is more desirable than the life loss. Some companies step the voltage down to 2,300 again, or direct from the sub-station. Laws, ideas, and convenience have to do with the voltage.

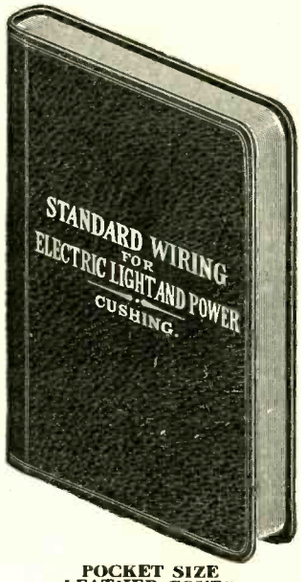
"Then again, the *three phase* effect that the A. C. made possible has put that form of service over the direct current way in practically all power work. The three phase motors have first place in efficiency, you know."

"What is three phase?" asked Bender.

"In alternating currents we have *single phase* currents. The working of the current is generally described on paper by drawing a straight horizontal line representing zero—no current. All above the line is current in one direction, say positive. All below the line negative. The vertical distance from the line represents the height of the voltage. The voltage in a single phase current under ideal conditions would describe a continuous reversed curve, a semi-circle above the line and a semi-circle below the line. It will be seen then that the potential raises from zero to the maximum and to zero, thence to maximum in the other direction. You see the effective voltage is not the maximum voltage, for part of the time there is no flow in the circuit, and part of the time there is more than is recorded on the voltmeter. I guess that explains the single phase.

"Then in actual practise we have *two* and ***three phase*** alternating currents. In the two phase when one circuit is dead, the other is making an impression on the line. In the three phase each wave comes up just as the other is dying and keeps up the 'racket' in a much better manner than is possible for the intermittent single phase, or the two phase."

"And a volt is the pressure on the circuit. An ampere is the rate of flow. The volts times the amperes equals the watts. One thousand watts equals one kilowatt," rambled on Punk. Then turning to Stokes, "Isn't that right?"



"Right," responded Jazz, "and the juice peddlers stick you up so much per kilowatt——"

"Yes," interrupted Bender, "too much."

All You Need to Know About Wiring

Is In This Latest Edition of "STANDARD WIRING"

It Will Make You An Expert Wireman

POCKET SIZE
LEATHER COVER

GENERATORS—How to install them, care for them and operate them; all their troubles and how to prevent and cure them; all diagrams showing connections for compound, series and shunt wound machines. How to operate them in parallel or in series. How to protect them and wire them in accordance with the underwriters' requirements.

MOTORS—How to install them, how to protect and operate them. The required amperes, volts or horse power when any two factors are known. How to take care of hot boxes, sparking commutators and other troubles. How to change the direction of rotation when desired. How to start and stop any kind of motor in any class of service. All diagrams of motor wiring. How to find the proper size of wire for any motor for direct current or for A. C. single, two or three-phase.

OUTSIDE WIRING—Pole line construction, line wires, service wires, roof structures, poles and their dimensions and weights, and how to erect and protect them and wires they carry. Insulators, guard arms, guy anchors. Tree wiring, splicing, service and entrance wiring. How to install Lightning arresters. Transformers with diagrams and instructions.

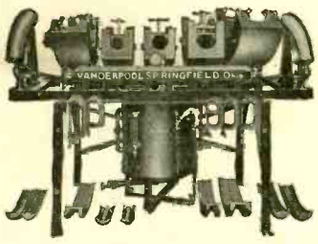
INSIDE WIRING—when and where to use rubber covered, slow burning and weatherproof wire. How to find the proper size of wire to use for lamps, motors or heating devices for any current, voltage and drop, either by formula or by the many tables that are given in this section of the book. How to wire for two-wire or three-wire systems. Direct current, two-phase and three-phase with formulae and tables, with examples worked out for each system and in a simple manner that anyone can understand and use. How to run wires on walls, ceilings, floors, through partitions and walls and in concealed places, damp places and where dangerous surroundings exist. When and where to install Switches, Cut-outs and Circuit Breakers and just how to do it. How to wire for high and low voltage systems and the precautions to be taken. The proper way to install Knife and Snap Switches, Cabinets and Cut-out Boxes, Outlet, Junction and Switch Boxes, Panel Boards, Wooden and Metal Raceways. How to install complete interior conduit jobs either for rigid metal, flexible metal or flexible non-metallic conduit. Concealed knob and tube work or armored cable. How and where to install and wire electric and combination lighting fixtures. How and where to use flexible cord and where not to use it. How to install arc lamps and gas filled lamps and the fixtures and rules required.

LIGHT AND ILLUMINATION—What is meant by proper and efficient illumination, the latest data on Mazda and gas filled lamps of every candle power and wattage. Direct, indirect and semi-indirect illumination and where each should be used. Illumination required for various classes of service from show window lighting to public halls and from factories to small residences.

TABLES—Fifty-two tables giving every dimension, carrying capacity, resistance, weight and strength of every size of wire and cable of copper, steel and iron.

All the necessary dimensions, capacities, weights, and other data on conduits, fuses, insulators, lamps, sockets, motor efficiencies, current per horse power of motors. Electrical units and their equivalents. Proper size of wire for all classes of power, light and heating installations. The proper symbols to use to indicate on plans just what is wanted from a motor to a small snap switch with all necessary diagrams.

APPARATUS AND SUPPLIES—A classified list of the leading manufacturers of officially approved wires and wiring devices. Engines, generators, motors, appliances, fixtures, and all supplies necessary for any complete installation from a Central Station to a small cottage.



The most complete and accurate Book on Wiring and Construction published

Speeding Up the Airship

(*Continued from page 397*)

equally light gas, which we do not know of as yet.

On its first visit to the United States, the R-34 proved beyond controversy that the natural element of the dirigible is the air. As long as an airship remains from 300 to 500 feet above the surface of the earth it is comparatively safe, and at this level it will be possible for it to ride out any storm. The airship in this instance is not any different from the steamship, which can ride out any storm, as long as it is in the open ocean. What the steamship fears is the proximity of land or reefs, which usually spell its doom.

The future airship will not land its passengers by coming down to earth, any more than the steamship lands its passengers by climbing upon dry land. The airship will be fastened to earth by means of long thin steel cables from 200 to 500 feet long, and only one or two of these cables are needed; they will probably be attached to either the center or the nose of the airship. The passengers will then be landed by means of a landing passenger and freight elevator built into the airship, as described in our article in the July issue. This idea is also depicted in the above illustration, which shows the portable elevator built into the airship.

Making a Machine for Telegraphing Pictures

By Leroy J. Leishman

(*Continued from page 421*)

of its shaft by about 4 inches. The width of the base should be 8 or 9 inches. It is inadvisable to make these bases from metal, as short-circuits are too liable to occur. Wood is good enough.

Five holes are to be bored in each base as indicated in Fig. 2. A and B are for binding posts. C should be a small hole to accommodate a piece of annunciator or magnet wire. D and E should be large enough for two flexible cords such as that used for light drops. Do not bore E until the machine is practically completed for reason that will be apparent later.

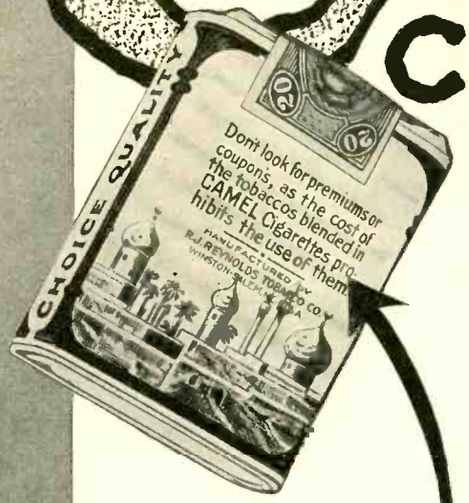
The uprights A (Fig. 1) that support the cylinders must be made of metal. They can be triangular shaped, and should have half an inch of the lower edge turned up to a right angle for affixing to the base (see B, Fig. 1). From this angle to the hole which is to be bored at the top for the cylinder shaft the distance must be at least a half inch more than the radius of the cylinder. The holes in these *must be bored exactly the same distance from the bottom, so that the cylinder will be supported absolutely level.*

The cylinder should be mounted close to the opposite edge of the base to that near which the holes were bored for the binding posts. The binding posts are at the back of the machine, and the cylinder at the front. Mount the cylinder and shaft so that the cylinder comes about 3 inches from the end of the base, leaving about 1 inch between the end of the rod and the other end of the base. One support should be placed against the cylinder and the other about 1 inch from the end of the shaft (see F and G, Fig. 2). Screw the supports in place so that the cylinder is parallel to the edges of the base, and then place the cylinder rod thru the holes provided for the purpose. If Meccano or Erector material is used, collars can be obtained for keeping the cylinder and other parts in place.

Now get a cold-rolled steel rod about 3 inches longer than the cylinder and about ¼ inch in diameter. Have this threaded within a half inch of one end and an inch of the other. No particular pitch is essential, as the progress of the carriage can be governed by other means. The unthreaded ends must now be turned down to the same size as the cylinder rod, so that the same make of gears or pulleys will fit. Then secure a rod about a half inch shorter than the threaded shaft. This rod can be of the same diameter and material as the cylinder shaft.

The height of the supports for these will vary with the material at your disposal for the carriages, which can be made from ordinary telegraph sounders by soldering an extra piece on the end of the arm where the spring is attached. This piece can be the same width and thickness as the original arm of the sounder, but must be at least 3/16 inch square. The length will be dependent upon the diameter of your cylinder and the way the sounder is mounted on its own base. Hold the sounder level and at the same height as the cylinder rod, keeping the end of the sounder with which we are concerned toward the cylinder and the base of the sounder at least ½ inch behind the cylinder. The addition to the arm must be long enough to extend about ⅛ inch beyond an imaginary line perpendicular to the base of the whole machine and extending thru the center of the cylinder when the carriage is held in this position. The phonograph needle, to be placed in the end of this extension arm, will then touch the cylinder right at the top. Drill a hole the size of a steel graphophone needle down thru this extension arm about ¼ inch from the end, when measured from the top, and slightly less than 3/16 when measured from the bottom, so that the needle will set at an angle of thirty or forty degrees. As the needles must be changed, a thumb screw (H, Fig. 2) should be placed in the right side of this arm to hold the needle in place. A Victor or Columbia graphophone thumb screw is satisfactory, and most phonograph repair shops have taps to thread holes to fit.

If you do not have two sounders—one for each machine—the essentials for making the carriage are merely the needle arm, the fulcrum, a pair of electro-magnets, a bar for the magnets to attract, a coiled spring, and a stop to prevent the arm from moving too far up or down.



Under the front of the carriage, near each side, some sort of threaded half-nut arrangement must be provided. It is satisfactory to use a couple of pieces of tin with the edges turned down and slotted approximately to fit the screw or threaded shaft. Place one at each side. Under the back of the carriage two screw eyes can be used for the guide rod to pass thru.

The height of the uprights or supports C (Fig. 1) for the guide rod D and threaded shaft E can now be determined. They should hold these rods at a height which will support the carriage so that the end of the phonograph needle in the end of the arm will touch the cylinder when the arm is in its downward position. These supports can be made of metal, like those for the cylinders, or else from wood. Separate supports can be made for the screw and rod, or else double supports with two holes. *The screw and rod must be absolutely parallel, otherwise the carriage will catch or bind.* They must also be parallel to the cylinder, but not necessarily in the same plane. This means that great care must be taken in boring the holes in the uprights so that the screw and rod will be not only the proper distance from each other, but absolutely the same distance from the base thruout. Be sure, therefore,

(*Continued on page 448*)

Camel CIGARETTES

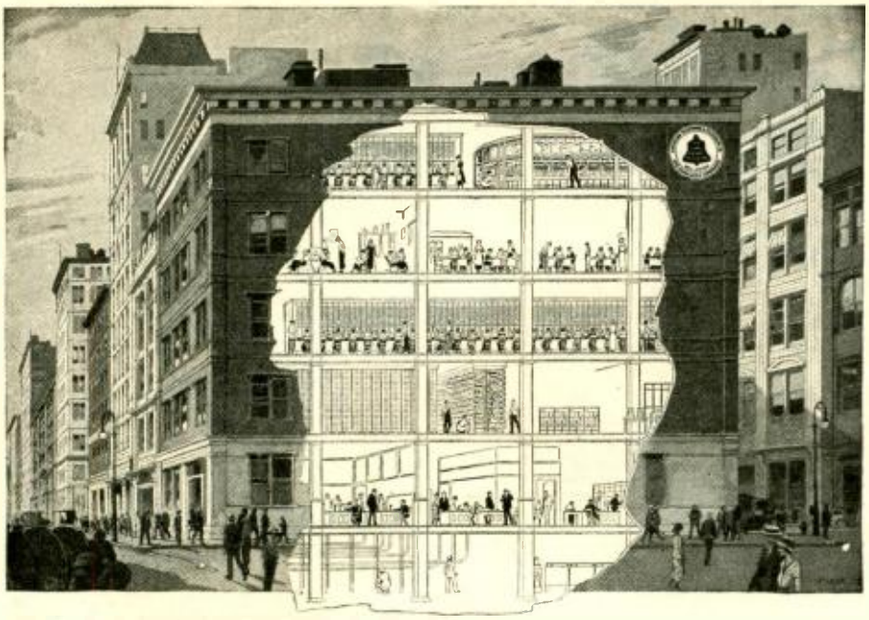
18 cents a package

Smokers realize that the value is in the cigarettes and do not expect premiums or coupons!

Camels supply cigarette contentment beyond anything you ever experienced! You never tasted such full-bodied mellow-mildness; such refreshing, appetizing flavor and coolness. The more Camels you smoke the greater becomes your delight—*Camels are such a cigarette revelation!*

Everything about Camels you find so fascinating is due to their quality—to the expert blend of choice Turkish and choice Domestic tobaccos. You will prefer this blend to either kind of tobacco smoked straight.

You'll say Camels are in a class by themselves —they seem *made to meet your own personal taste* in so many ways!



Freedom from any unpleasant cigaretty after-taste or unpleasant cigaretty odor makes Camels particularly desirable to the most fastidious smokers. And, you smoke Camels as liberally as meets your own wishes, for they never tire your taste! You are always keen for the cigarette satisfaction that makes Camels so attractive.

Compare Camels with any cigarette in the world at any price!

R. J. REYNOLDS TOBACCO COMPANY, Winston-Salem, N. C.

Camels are sold everywhere in scientifically sealed packages of 20 cigarettes or ten packages (200 cigarettes) in a glassine-paper-covered carton. We strongly recommend this carton for the home or office supply or when you travel.

The Great Task of Construction

With the coming of peace the Bell System faced an enormous construction program. Conditions arising from war resulted in the wiping out of the reserve equipment normally maintained, and necessary to give prompt connection to new subscribers. The release of industry and accumulated growth of population now makes telephone demands almost overwhelming.

Telephone construction, including buildings, switchboards, conduits, cables and toll lines, must, from its inherent nature, be undertaken in large units. A metropolitan switchboard, with its tens of thousands of parts, may require from two to three years to construct and install.

Only great extension can meet the present excess burden of traffic and provide for future requirements. Extension which cares for immediate demand, only, is uneconomical and calls for continuous work of such a character as to be frequently detrimental to the service.

During the war the Bell System devoted all its margin to the needs of the Government. The great task of getting back to normal pre-war excellence of operation requires the reestablishment of an economic operating margin capable of taking care of a larger growth than has ever before confronted the Bell System.

Construction is being pushed to the limit of men and materials; while every effort is being made to provide the best, present service.

Making a Machine for Telegraphing Pictures

By Leroy J. Leishman

(*Continued from page 446*)

that the rod and threaded shaft are straight. Mount these so that the rods extend the same distance beyond each end of the cylinder, and so that the front of the mounted carriage comes about ¼ inch behind the cylinder with the needle at the top of the cylinder directly above its center.

The only place in the whole set of machines where pulleys can be used instead of gears is in connecting the threaded shaft and the cylinder. The pulley I (Fig. 2) for the screw must be larger than the one on the cylinder rod, the exact size depending on the pitch of the threads and how dark or light you may desire the telegraphed pictures to be. The cylinder should make from 60 to 120 turns while the carriage travels 1 inch. After the pulleys are placed on the rods and lined up, put on a cord, elastic band or spiral spring for a belt.

It is essential that the cylinders of both machines turn as true as possible. If they do not do this, bend the rods till they are as perfect as you can make them.

Hole E (Fig. 2) should now be bored about a half inch behind the guide rod D (Fig. 1) and J (Fig. 2), and midway between its two ends.

After both machines are this far completed, they may be wired. Get a piece of flexible fixture cord and cut two pieces about 2 feet long. Peel the ends and scrape the strands of wire till they shine. Inasmuch as it is difficult to tell which one of the wires you want after they are drawn thru the base, it is best to twist both ends of one of the wires in such a way that it will be recognized from the other. Put a pair of these wires thru hole E in the base of one machine, and use the other pair in like manner for the other instrument. Attach one wire to the terminal of the magnet windings on the carriage, and also ground it so that it is electrically connected to the metal arm bearing the phonograph needle. Connect the other end of the same wire to one of the binding posts. The other wire should be connected to the other side of the carriage magnet windings, so that a current in both wires will energize the magnets and lift up the needle. The remaining unconnected end of these wires should be drawn thru hole D (Fig. 2), where it is to be connected to the right side of a two-way battery switch G (Fig. 1). The slack in this wire should be pulled above the base to give the carriage plenty of play. A piece of magnet or annunciator wire should lead from the left contact of this switch thru hole C, and be grounded to the support of the cylinder rod. The main terminal of the battery switch must be connected to the other binding post at the back of the base. Both machines must be connected the same way.

Now suppose we examine these circuits. First turn the battery switch to the contact at the left—the position used when "sending." The current now comes from the binding post to the switch, thru the right contact to the upright and thru the rod to the cylinder, thence thru the needle down one of the flexible wires to the other binding post. When the switch is thrown to the right or "receiving" position, the current passes to the carriage magnets.

Excepting for the gear connections, the machines themselves are now completed, but as no picture can be transmitted unless the cylinders run in *synchronism*, I shall presently explain three ways to synchronize them before showing how to prepare and transmit a picture.

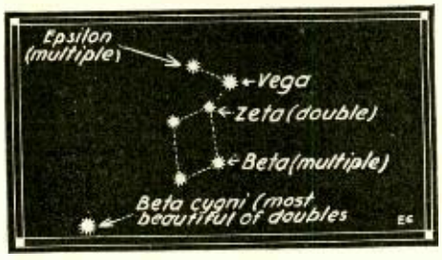
(*Part II will appear in the October issue*)

Popular Astronomy

By Isabel M. Lewis

(*Continued from page 400.*)

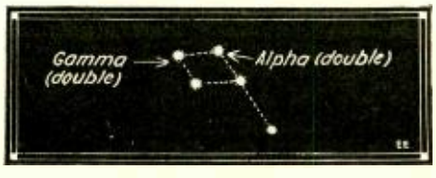
his weight would be zero. Continuing from the center to the surface thru the same shaft the weight would increase progressively until the surface value of 150 lbs. was restored.



WEIGHT ABOVE SURFACE OF EARTH.

If, on the other hand, it were possible for a man to ascend above the earth's atmosphere he would still be subject to the attraction of the earth (see diagram IV), but the force would *decrease* inversely as the square of his distance from the earth's center, so at a distance of two radii, or 8,000 miles from the earth's center, a man weighing 150 lbs. at the surface would weigh only one-fourth as much as at the surface of the earth, or 37½ lbs. At a distance of six radii, or 24,000 miles, from the earth's center, he would weigh 4⅙ lbs., and at a distance of about 12¼ radii, or 50,000 miles, his weight would be only one pound. If the distance should be increased to four times this amount, or 200,000 miles, his weight would be decreased to one-sixteenth of his weight (at 50,000 miles)—or one ounce.

ASTRONOMICAL QUESTIONS AND ANSWERS.



Question 1. What is the sidereal system and sidereal time?

Answer 1. (a) The terms sidereal system, stellar system, and sidereal universe, are all synonymous and refer to the organized system of the stars in which our solar system is a single unit. The stars do not move in a haphazard manner but are governed by some definite law and purpose

and organized into some great system. To this system belongs the Milky Way as well as practically all the stars, both visual and telescopic, the great irregular gaseous nebulae, the globular star clusters and loosely formed moving star clusters, such as the Hyades and Pleiades groups. It is not yet known whether the spiral nebulae are subordinate units in the sidereal system to which our sun and his satellites belong, or whether they are external systems or external universes independent of our own sidereal system and units along with it in some vaster system.

Answer 1. (b) Sidereal time is "star" time as distinguished from solar time or "sun" time. A sidereal day is the interval between two successive passages of the meridian across the same star. The sidereal time of any place on the earth is zero when the meridian of that place crosses the vernal equinox (point of intersection of the celestial equator and the ecliptic), which is chosen instead of a star as the point of reference for sidereal time. A "solar" day is the interval between two successive passages of the same meridian across the center

Why Not Earn $35.00 to $100 A Week As A Mechanical Draftsman?

"Get into the profession of big pay and Rapid Advancement with the help of the school that has started hundreds on the Road to Success. I am ready to help you." Roy C. Claflin, President, Columbia School of Drafting.

Learn At Home In Spare Time

You don't have to stop work or leave home in order to become a trained Draftsman. Through our practical home study Training we will teach you Right in Your Own Home so that you will soon be able to qualify for a good position at Big Pay. We will continue to instruct and help you until we know you have the knowledge necessary to succeed.

No Previous Training Necessary

Right now—TODAY—there are openings for thousands of Draftsmen in the Government Departments, industrial concerns, and the big engineering offices. One department alone recently called for 1,800 draftsmen. With this tremendous demand has come a big increase in salaries.

Draftsmen Are Getting $35 to $100 a Week

with big chances for even better pay as the demand grows. By enrolling NOW for our practical Home Study Course in Drafting you can quickly qualify for a position as Draftsman and by properly applying the principles we teach.

You Have a Chance to Become a Chief Draftsman

and get to the very top in this fascinating profession. Our course will give you just the knowledge you need to make good as chief draftsman when your chance comes.

Peace Calls For More Draftsmen

With the problems of reconstruction facing the nation the demand for draftsmen is even Greater Than During the War. All big engineering, construction and manufacturing projects must first go through the drafting room before the workmen can commence. You can help in the work of reconstruction and secure a Big Salary with excellent opportunities for advancement. Prepare now and be ready when the demand reaches its height.

We Will Help You Secure a Position

as soon as you complete our course. We have already placed hundreds of our graduates in good paying positions and are constantly in touch with vacancies for which Draftsmen are Urgently Needed. Government Departments and Private Concerns are continually calling upon us for our graduates because they know that our instruction produces draftsmen of the caliber they need.

Thousands of Men Wanted Right Now

Drawing Outfit FREE As soon as you enroll you will be sent our special drawing outfit FREE so that you will be sure to have it to work with while taking the course. This set will be yours to keep. You are not asked to return it after completing the course.

Illustrated Book of Particulars Sent Free

Fill in the coupon below—send it to us and we will send you FREE a copy of our illustrated book telling all about our practical Home Study Course and how you may secure our instruction at once on Easy Terms so as to quickly qualify for one of the Big Positions Now Open.

Mail This Coupon To-day

of the sun. As the sun appears to move eastward among the stars about one degree a day the solar day is longer than the sidereal day by about four minutes, the time that is required for the meridian of the place to turn thru an angle of one degree and "overtake" the sun. Since the sidereal day is four minutes shorter than the solar day the stars appear to rise four minutes earlier and to come to the meridian four minutes earlier each successive evening.

Question 2. Please name and locate a few double and multiple stars.

Answer 2. An interesting multiple star is Epsilon Lyrae, now visible in the constellation Lyra about 2° N. E. of Vega (on the meridian 9 p. m. Aug. 30). The two wider components are 207 seconds of arc apart and can be distinguished as separate objects by persons with exceptionally fine eyesight. Each of these components is itself a double star and can be separated with a three-inch telescope. Beta Lyrae, about 6° S. E. of Vega, is not only an interesting multiple star but also a remarkable variable with a period of nearly thirteen days and a range of one magnitude.

There are several interesting doubles in addition in this constellation, which is a fine field for a three-inch telescope.

Beta Cygni, about fifteen degrees to the southeast at bottom of Northern Cross is a most beautiful double.

In the constellation Delphinus, known as Job's Coffin, are two fine doubles, Gamma and Alpha. This constellation is a small diamond-shaped group of stars about 30° to the southeast of Lyra.

In the constellation Scorpio (in southern skies in August west of meridian in the early evening) are three interesting doubles, Sigma, Beta and Nu. Sigma is the star just north of Antares, the brilliant red star in this constellation. Antares also has a greenish companion, but it takes a four-inch telescope to separate it. Nu and Beta are about ten degrees northwest of Antares.

200,000 Horse-power in One Hour

(Continued from page 409)

will go out of its way or take a round-about course. However, it notifies the system operator; subsequently these warnings either discontinue, or the rapidity of the signals increases as the storm approaches or dies out. With this storm, however, it was different; it approached with hurricane velocity, and when about one-half to one hour away the bell strikes every minute.

This now became a positive signal that the storm was about to break, and that within a very short time. The fires in the boiler room, which have been banked up to the present time, are now let loose and coaled up. Within a short time "steam is up" in the boilers. The system operator now, by means of telephone or other forms of annunciators, directs the starting of the gigantic reserve generators, so that everything will be in readiness should the storm break. Now the auxiliaries are started. The system operator is warned by the bell ringing continuously, and the device, which

Adventures of the Auto-Wheel Coaster Club

The Circus Parade

Jim, the Club Captain, is a great one for new ideas. When the circus hit town last week, he said the Auto-Wheel Coaster Club "ought to march in that parade."

So we all took our Auto-Wheels down to the show-lot, and when the march started we joined in. We hitched on to the biggest elephant in the show and followed along.

We didn't have to decorate those Auto-Wheels. They're good-looking to begin with. And they ran along just as smooth as autos. You should have heard the crowd cheer when we passed. "Biggest Hit in the Whole Parade," the folks said. And after it was over five fellows came up and wanted to know where they could get Auto-Wheels. Jim sent them to the local dealer, and they are going to join the Club. Jim has sent to The Buffalo Sled Co., for FREE Club Caps for them, like ours.

BOYS!—DO YOU WANT WAGONS LIKE THESE?

The Auto-Wheel Coaster is a wonder—smooth-running, strong, speedy. The Auto-Wheel Convertible Roadster is two wagons in one—can be changed from a Coaster to Roadster in a second.

Send us three dealers' names, telling which one handles the Auto-Wheel. We'll send you Free Felt Pennant and Booklet.

The Buffalo Sled Co.,

has finished its overtime work, is now short-circuited. There is no further need of warning. The city becomes enveloped in darkness equal to that of night. Suddenly the storm breaks and together with a downpour of rain comes the click of so many light sockets and the pull of so many chains, and we think no more of it. The "juice" is there and we have light.

We never realize how those fellows up at Waterside station have to work in order to supply this demand. There is the crashing of many huge switches, as extra feeders are put into operation, and finally as a last resort powerful storage batteries are thrown into the circuit so as to supply the city with its increasing demand for electricity—and this has been done with no inconvenience and without bravado. Thanks to the Edison service, New Yorkers were able to work at their offices as late as desired, while the house and theater lights blazed forth by the hundred thousand.

Electric Cookery—A Snap!

By Grace T. Hadley

(*Continued from page* 412)

oven switches on *High* for fifteen minutes in advance. Bake paste fifteen or twenty minutes on *High* heat.

Quick Coffee Cake.—Turn oven switches to *High* before preparing cake. Sift together twice one pint of flour with one-third cup of sugar, three heaping teaspoons of baking powder, one-half teaspoon each of salt and cinnamon. Mix to a soft dough with one cup of milk stirred into a well-beaten egg. Add four tablespoons of melted butter and spread in a buttered shallow pan. Sprinkle over with granulated sugar mixed with cinnamon. Bake on lower grate from twenty to twenty-five minutes, turning switches to *Medium* for last ten minutes of baking.

Date Muffins.—Cream three tablespoons of butter with three of sugar and add two well-beaten yolks of eggs, then three-fourths of a cup of milk and two cups of pastry flour sifted with three scant teaspoons of baking powder. Beat well and add the stiffly beaten whites of the eggs and a cup of dates cut into small pieces. Turn oven switches to *High* twenty minutes in advance and muffins should bake in from twelve to fifteen minutes with switches left on *High*.

Advantages of Electric Ranges.

The modern electric range is really a triumph in beauty of design and workmanship. Clear white enamel walls and oven door panel, bright nickel trimmings make this type of range a source of pride and joy to the particular housewife. There is so much labor saved. There are no black bottomed pans and pots to be washed, hence there is a great saving in the matter of cleaning up after the cookery process. The easy control and perfect regulation of the heat establishes dependable temperature conditions. Best of all is the satisfaction of doing good cookery in the most modern way.

"I would not be without my electric range for anything," is the verdict of Mrs. Modern Housewife.

A Dinner Prepared in Automatic Electric Range.

Chicken, 3 lb.; pudding, 1 quart; baked potatoes, six. Place in upper oven; current on thirty-five minutes. Wattage should be 875.

Scenes from the Universal Film "Heads Win!"

"Heads Win!"

Traffic jammed at the rush hour! Crowds thronging station platforms! A mile of stalled trains! The swing-bridge would not close and all because down in the power house something had gone wrong and nobody knew what—until Jim came to the rescue.

Each night thousands are seeing unfolded on the screen the thrilling story of Jim Godfrey, who, in the hours after supper, with the help of the International Correspondence Schools, had put a trained head on his shoulders—a head that knew what to do in an emergency.

There are thousands of Jims in real life. You will find them in offices, shops, stores, factories, in mines and on railroads. For in every city and town and in every line of industry there are men who have gained in spare moments, with I. C. S. help, special training in the work of their choice.

There are men like Jesse G. Vincent, who rose from a toolmaker's apprentice to inventor of the Liberty Motor; men like Joseph G. Tynan, the laborer who became the world's greatest ship builder; men like Robert E. Ramsay, the clerk who became editor of Advertising and Selling. There are carpenters' helpers who became architects, bookkeepers who became general managers, men and boys who rose from nothing at all to responsible positions at splendid salaries.

It's simply a question of training. Your hands can't earn the money you need, but your head *can* if you'll give it the chance. "Heads win" every time!

More than two million men and women in the last 28 years have let the I. C. S. help them win better jobs, make more money, enjoy happier homes. Over one hundred thousand right now are turning their spare moments to profit. Hundreds are starting every day.

Can you still go on, putting in your days at the same grind, getting the same pay envelope with the same insufficient sum, keeping up the constant fight against a soaring cost of living, when a little grit on your part could be the means of changing your whole life?

It is easily possible for you to have the position you want in the work you like best, to have a salary that will give you and your family the kind of a home, the comforts, the little luxuries, the enjoyments that you would like them to have. No matter what your age, your occupation, your education or your means—you can do it!

All we ask is the chance to prove it. That's fair, isn't it? Then mark and mail this coupon. There's no obligation, and not a penny of cost. But it may be the most important step you ever took in your life. Take it *now!*

Carrots, spinach, turnips, in three-cluster utensil. Current on fifteen minutes. Wattage 213.

Food cooks in both ovens one and a half hours.

Make coffee in electric percolator, four cups; 167 watts.

Princess Pudding.—Two-third cup butter, one cup sugar, one large cup flour, three eggs, one-half teaspoon baking powder, small glass cider. Rub to smooth cream butter and sugar, add eggs one at a time, beating few minutes after each addition; add flour sifted with baking powder and cider; put into mold well buttered, set in sauce pan in some boiling water; steam thus one and a half hours; turn out on dish carefully; serve with lemon sauce.

Tapioca and Cocoanut Pudding.—One cup tapioca soaked overnight, one quart milk, yolks four eggs, whites of two, one cup sugar, two tablespoons grated cocoanut; bake one-half hour. Make frosting of whites of two eggs, three tablespoons sugar, two tablespoons grated cocoanut; spread over pudding when baked. Set in oven until light brown.

DINNER
Asparagus Soup
Pseudo Roast Chicken
Carrots Espagnole
Baked Tomatoes or Potatoes
Salad
Fruit Tarts Whipt Cream
Demitasse

Pseudo Roast Chicken.—To avoid cold storage chicken and yet have it tender, try the "pseudo roast." Take the cleaned fowl, place it in kettle of water already heated to boiling. Simmer gently in boiler oven, current low, until chicken meat becomes tender; twenty minutes before mealtime baste chicken with butter and place in oven, current on *High* until golden brown.

Carrots Espagnole.—Boil and mash thru a colander two or three bunches of carrots; beat into them melted butter, pepper, salt and cayenne or paprika; add two eggs well beaten and grated cheese to taste; bake in mold and serve turned out on a hot dish; garnish with parsley. It should be as light as a souffle. Cook carrots in boiler oven. Bake tarts, tomatoes or potatoes, chicken and carrots espagnole in large oven.

Electric luncheon to Northwestern Electric Equipment Co. by Edison Electric Appliance Co., Hotpoint Division, January 10, 1919. Menu for forty-five guests:

Celery Olives
Chicken Soup Wafers
Roast Beef, Meat Sauce
Potatoes and Peas in Cream
Sweet Corn in Ramekins
Raisin Bread Sweet Rolls
Head Lettuce Salad
Plum Pudding, Hard Sauce
Coffee Cheese Straws
Van Dyke Cigars

Prepared on electric range by Miss Bell, of the Minn. Gen. Elec. Co.

10 cans soup	469	watts
18 lbs. roast beef	2,325	"
1½ pks. potatoes	1,188	"
2 cans peas, 5 cans corn	300	"
6 loaves bread	1,000	"
5 doz. rolls	700	"
50 portions pudding	1,275	"
70 cups coffee	525	"

At 4 cents per kilowatt-hour, this generous repast was prepared entirely at a cost of 31 cents per person. The operation was in charge of Miss Bell, of the Minn. Gen. Elec. Co., with one assistant, and not only were they on the job only ninety minutes, but the task found them just as sweet and clean as tho they had never seen a kitchen.

Total wattage was 7,782, or 172.9 per person. How was it done? By utilization of one great essential in successful range operation—stored oven heat. Of four surface burners only three were used to a current consumption of 2,682 watts.

$200,000 RADIUM INSTITUTE TO TREAT CANCER.

The establishing of a splendid Radium Institute for Cancer Treatment is being built at Los Angeles, Calif., by King C. Gillette, of safety razor fame. The institute is being established for the study and treatment of neoplastic (tumor and cancer growth) diseases. It will be the only one of its kind in the West, and will employ upwards of $150,000 worth of radium. Mr. Gillette is to be president of the institution, and Dr. Rex Duncan will act as medical director.

In his announcement recently Dr. Duncan, who has just returned from the East, where he studied the use of radium at Johns Hopkins, Harvard and Cornell cancer research institutes, stated that the Los Angeles institute will use more radium and radium therapathic equipment than can be found in all the other territory west of the Atlantic Coast. The building "L" will cover an area 65x38 and 50x36 feet. In addition to its offices and elaborately-equipt laboratories, it will have a large number of beds for patients who find it necessary to remain at the institute for a time.

"The purpose of this institution," said Dr. Duncan, "is to provide unexcelled facilities for radium therapy, and the study and treatment of neoplastic disease. The benefits to be derived will be available to all requiring such treatment, and a fee consistent with the financial condition of the patient will be charged. Any profits earned above those required for the proper maintenance and equipment of the institution will be devoted to scientific and research work."

WORLD'S BIGGEST TURBINE DYNAMO—100,000 H. P.

(*Continued from page* 401)

chine is combined with the flexibility and reliability of three regular independent units.

The entire control of this turbine, together with all the others in the power house, is centered at an electric switchboard located in a room in the upper part of the power house. Here, by merely operating a few dozen small keys, resembling telegraph keys, the operator starts and stops the turbines in accordance with the demands of the transportation system, directs the current into various circuits as required, makes special connections to meet emergencies, and in other ways keeps New York constantly on the move. The responsibilities connected with this work can hardly be over-estimated, since a single error might tie up half of the city's elevated, subway, and surface lines.

In addition to this human control, a system of governors has been devised for the large turbine that automatically takes care of almost every possible contingency. In consequence, the machine practically runs itself and one of the things that strikes a visitor is the fact that workmen are rarely seen on the power house floor.

For the technical reader the following details will be of interest. Superheated steam enters the *high pressure* element at 205 lbs. pressure and dividing into two portions is exhausted into the *low pressure* elements at 15 lbs. pressure. From the low pressure elements it goes into the *condensers* in which a 29-inch vacuum is maintained; 826,000 lbs. of steam are used per hour for the maximum load, and the water rate is below 11 pounds of steam per kilowatt-hour. The generators are each rated at 20,000 KW continuously and 23,500 KW for two hours. Three-phase, 25-cycle current at 11,000 volts is delivered to the substations. The floor space occupied by the entire turbine is only 52x50 feet and its height is about 20 feet.

Oh! you Misfit!

LIONEL STRONGFORT

"Dr. Sargent, of Harvard, declared that Strongfort is unquestionably the finest specimen of physical development ever seen."

SAILING under the name of man. You know the truth if no one else does—you know what you lack—what you need. You may hide it from others in a way, but you can't hide it from yourself. Are you a victim of any pernicious habit that you want to get rid of? Have you a spark of ambition left to be the man you once were, to be the man you ought to be? Are you an easy victim of every little ailment that comes along, going around without snap or ginger, losing ground when you ought to gain it? Then wake up and be a man, not a misfit. Deserve the name of man; be vigorous, virile. It makes no difference if you are a physical wreck, if you join hands with me, I'll make you the kind of man that's wanted, the kind of man needed, the kind of man looked for, sought for, bid for all the time, and it will be done without drugs, or tonics or stimulants.

You will gain in vim, and vigor; your muscular power will increase in flexibility and strength, your nervous system fortified to renew its energy, not bolstered up for the time being, to fall back below the level it was, as it does when you resort to drugs or medicine.

You married men come across to yourself—get the pep and ginger and tingle of life into you. You are not living for yourself alone; you need dash, spirit, the enterprise you used to have. Regain and maintain your vigor; I'll show you how.

You business men—overworked, did you say? You are not doing half as much as you ought with your experience. Never mind, there is a way to get back your aggressiveness, to be right in the fight and enjoy it. You can double your percentage of real worth as a man, and enjoy life as you ought to be able to do.

You young man—think of your future—how about it—are you fit for marriage—are you qualified—do you feel it in your soul—are others sliding by you doing more—getting more than you are? I know what is dragging you down, what is keeping you down, and it is time, high time, that you **Stop.** No one can abuse nature and succeed; others tried it and failed miserably. Do you want to be a failure, or even worse than a failure? Then come to me; I have helped thousands; physically, mentally, morally. I will help you; I will make you the kind of young man that is a credit to any community— will make you so that your progress in any undertaking will be easier. Just be frank and above board—tell me your troubles. I will guide, direct and point the way; the natural way for you to achieve what I have said—Nature's way. You can stop the drain on your system, you can be free from bad habit, gain muscular tissue, be strong, virile, erect in carriage, courageous and likeable to all you meet. Let me be your guide, your teacher. I have pupils all over the world, learning a system of Health, Strength, moral courage building, known as

Strongfortism

Under my methodical system and the plan of practicing Strongfortism, you men can build your body up in symmetrical proportions as nature intended you to be. You will gain greater confidence in yourself, and compel others to have more confidence in you—it, best of all, brings you success—that you can call success, capped with the glow of health and the supreme joy of living. You can keep your youth with you, no matter what mistakes you have made, or what your present physical condition is, or what ailment or disorder you have—youthful errors, vital losses, devitalizing habits, poor memory, constipation, rheumatism, no matter what your present physical condition is. See that coupon, check what interests you, mail and I will send you helpful personal information. It will not cost you anything and it will surely help you to broader, bigger, better things and a great deal more happiness.

To know what Strongfortism can do for you, send for a copy of my book, "PROMOTION AND CONSERVATION OF HEALTH, STRENGTH AND MENTAL ENERGY." IT IS FREE—Just enclose three 2c stamps to cover mailing expenses to get a copy. SEND AT ONCE.

Under-Water Surveying by Reflected Sound Waves

By H. Winfield Secor

(*Continued from page* 405)

to the greater sound conducting properties here presented, the velocity of sound wave propagation thru water being about 4,700 feet per second, or somewhat over four times the velocity of sound traveling thru air. Otherwise the sound waves in water behave much the same as they do in air, giving all the echo, reflection and diffraction effects and other well-known phenomena with which we are all familiar.

AUDIBLE AND INAUDIBLE SOUND WAVES.

Mr. Ries has spent a great deal of time on research in the physics of sound wave propagation and reception, and one of his startling statements was the fact that in time of war or for certain other reasons (where multiplex or selective communication might be required in a constricted body of water), it then becomes possible to apply his sound surveying and detecting system by means of *inaudible* sound waves, i.e., sound waves pitched either above or below the normal register of the human ear. The human ear normally does not detect the presence of sound waves at below eight vibrations per second nor higher than sixteen to seventeen thousand per second, altho among radio operators it is common to "hear" at a higher limit of audibility—30,000 vibrations per second. The buzz of the beetle's wings is in the neighborhood of 16,000 to 17,000 vibrations per second, and this is about as high a sound as the average ear will note, unless specially trained. This particular detail is unusually interesting to us, for if audible sound waves have to be relied on to detect an enemy submarine for instance in war time, then the enemy might hear the sound waves.

By means of specially sensitive apparatus well known to engineers and physicists, it is possible by several distinct means to thus utilize for the purpose of solving the location of a distant object under water, by sound wave triangulation *sounds above the audibility of the ordinary ear.* Mr. Ries has devised apparatus which will not only detect such sound waves at two points on the base of a triangle, but also record them.

As Mr. Ries pointed out, it is a simple yet not commonly known fact of everyday physics that a sound that is inaudible to one person may be audible to another person, all depending upon the structure of the outer ear and the thinness and elasticity of the diafram in every case. It has been proven by scientists that there are a perfect multitude of sounds surrounding us all the time of which we have no cognizance, simply because our ears do not ordinarily respond to these abnormal frequency sounds. For example, there are certain insects which make sounds inaudible to ordinary persons, and thus it is believed that they carry on communication between one another. Furthermore, simply because we do not hear a sound, such as produced by Mr. Ries's 20,000 to 30,000 cycle surveyors, while listening at the receiver connected to a submerged microphone, is not a reason why our ears would not under proper conditions pick up and interpret that sound to the brain. If the form of the outer ear, i.e., the shell of the ear, were properly formed with regard to its length and angle, quite possibly the diaframs of our ears would respond. Therefore, it becomes apparent that to hear a certain sound is certainly a case of ultra-mechanics, or building a sufficiently sensitive apparatus to hear a certain sound or range of sounds.

(*Continued on page* 457)

The Electric Safety razor makes shaving a pleasure. Blade vibrating 7,200 times a minute cuts the beard smoothly and without slightest pull or irritation—feels like a gentle massage. Can be used with or without electric current.

All users of the Lek-Tro-Shav speak well of it

A barber says—"Have shaved for years and have never used any shaving device near its equal."

A home user says—"The most pleasing shave I've ever had in my life. Shaves my face closer than I used to shave, but there is no after irritation or ill effects as I usually get from another razor."

No. 1 Made for use from Light Socket.
No. 2 Made for use from Dry Battery.

Write for illustrated circular describing Lek-Tro-Shav Safety Razor fully.

BY ELECTRICITY

Complete sets of two machines of this marvelous equipment at ridiculously low prices. Instructive, mystifying and useful. This picture of President Wilson was telegraphed by these machines. Will transmit pictures, maps, drawings and hand writing. Picture telegraphing is the coming science. Write today.

J. LEISHMAN CO., Dept. T Ogden, Utah

Electricians

Get up-to-date in HOUSE WIRING! Save TIME, MONEY, LABOR and MATERIAL by using our 98 GENUINE BLUE PRINT DRAWINGS, containing all the latest diagrams and connections known in house wiring—every diagram and connection up-to-the-minute as used by first class electricians for wiring BELLS, BURGLAR ALARMS, LIGHTS, ANNUNCIATORS, FIRE ALARMS and ELECTRIC GAS LIGHTING. These drawings are bound in the form of a flexible book (9 x 12) for convenience in using on the job. Send for them, and if they don't make you more efficient as a wireman and save you many times their cost as a contractor, return them and money will be refunded—you can't afford to be without them. ONE DOLLAR postpaid. Send for circulars on other sets of drawings.

STAMMERER

Send 10 cents for my remarkable book, "How To Stop Stammering." Kill the fear of stammering. Re education the key.

The Hatfield Institute, 109 N. Dearborn St., Chicago, Ill.

In this Department we publish such matter as is of interest to inventors and particularly to those who are in doubt as to certain Patent Phases. Regular inquiries address to "Patent Advice" cannot be answered by mail free of charge. Such inquiries are publisht here for the benefit of all readers. If the idea is thought to be of importance, we make it a rule not to divulge all details, in order to protect the inventor as far as it is possible to do so.

Should advice be desired by mail a nominal charge of $1.00 is made for each question. Sketches and descriptions must be clear and explicit. Only one side of sheet should be written on.

Developing an Idea*

By Nelson Hall

NEARLY every one at some time gets an idea that he would like to develop if he knew it was worth while. That is if the field is not already covered or paralleled. It is always a burning question with inventors to know what has or is being done along the line of his idea. In these days when improvements are being made so fast that the patent office issues over a hundred patents a day, it is not uncommon to find, much to the inventor's distress, that some one has covered his cherished idea with a patent or come near enough to be an interference. Realizing the time and money spent in developing, the litigation involved in interference or overlapping of claims, and the disappointment that comes from an invention which has little or no market value, the following information is being offered to those who are developing ideas.

When an idea occurs give it some time and attention. Lay it out in the mind as much as possible, make rough sketches until a clear mental picture is formed. Building models or samples is always very instructive and aids much in producing a working article. At any rate think it out so it can be drawn or some one can be directed to draw it or build it if it is a construction, or go thru the sequence of operations if it is compounding or manipulating drugs or chemicals.

When the conception is developed sufficiently that it can be seen thru all the operations and the parts are in fair proportions, make a complete assembly drawing showing very clearly the new parts, improvements and the novelty. Also write a brief concise but lucid description to accompany the drawing, and take these before a notary public and have one or more of your friends who understand the drawing and description sufficiently to identify them sign as witnesses. If a model has been made photographs of it should accompany the drawing and description. This is much stronger evidence, because it shows that work has actually been done in developing. By these papers and the date affixed by the notary public a record is made that will be taken in court should it ever be needed. Very often the date of conception is of the utmost importance in establishing the priority of claims.

Do not conclude that such documents make it unnecessary to take out a patent, for such is not the case. Should any one secure a patent on the same idea, tho your conception antedated his, it would cost a lawsuit to establish your claims. If too much time had elapsed from the time of the witnessing *the court would consider yours an abandoned idea* unless you could produce evidence of your developing. One should not delay taking out a patent. He should file his application as soon as he knows the idea will work, can be manufactured and marketed. But before one decides how well his idea will work, how suitable it will be for manufacturing and how well the buying public will receive it, some very careful thinking technically and painstaking sounding among manufacturers, prospective users, and salesmen are required.

Every one meets people in several walks of life during each twenty-four hours of the day, and some of these may have just the information desired. By a little artful juggling of words the conversation can usually be shifted to the desired topic and run something like this if, let us say, a tire iron is the idea under consideration:

"I just saw (in mind or the mental picture which was worked out in getting the idea into a working form) a man repairing a tire with a very unique tool. The way he rolled that four and a quarter over the rim beat anything I ever saw, and when it came to replacing it was just as easy."

"What kind of tool was it? I have seen several and have a very good one with my car."

"It was about eighteen inches long with a peculiar shaped hook at one end that slipt under the tire and hooked on the rim, giving an unusual amount of leverage. I understand that it is new and is going to be put on the market soon."

By carrying the conversation further an opinion can be formed whether or not this man who is a user of a car and a prospec-

* Owing to the fact that this special article by Mr. Hall is running this month, the usual "Patent Advice" Questions and Answers will appear next month.

U.S. PATENTS

Don't Lose Your Rights

Before disclosing your invention to anyone send for blank form "Evidence of Conception" to be signed and witnessed. A sample form together with printed instructions will show you just how to work up your evidence and establish your rights before filing application for patent. As registered patent attorneys we represent hundreds of inventors all over the U. S. and Canada in the advancement of inventions. Our schedule of fees will be found reasonable. The form "Evidence of Conception" sample, instructions relating to obtaining of patent and schedule of fees sent upon request. Ask for them,—a post card will do.

tive buyer feels the need of a new tire iron. Sounding out several such men gives a fair idea of how keenly the public feel the want. This is very essential, from a financial point of view. It is possible for an invention to work perfectly, be a good manufacturing proposition and still not be received favorably by the public.

Often the original patents have expired before the public realized the merits of the invention. This was the case with the typewriter. Offices needed the typewriter, but there were no operators, and it was only after a long and tedious delay of developing operators, educating the public, and perfecting the machines that they became universally adopted in practice. Many of the original experimenters were dead before typewriters found their way from the inventor's shop.

Parallel with this is the modern steam turbine. Mr. Parsons' original patents expired before the turbine was considered seriously as a prime mover by the engineering profession. Mr. Parsons received his returns not from his patents but from his advanced knowledge gleaned from the experimental work which became a priceless asset in his later engineering practice. All this goes to show how important it is for the inventor to realize the condition of the public's wants. Many an inventor has been obliged to abandon an improvement because he could not stay in the game until the public realized its merits. Financial backers are liable to lose interest and withdraw their support if they have "come in" expecting a quick turnover, and it takes several seasons instead. Inventors are prone to be too optimistic about the public's receptivity of their invention and to paint such glowing pictures of success that their organization is sorely disappointed with the volume of business and the financial headway made in a given time.

If one meets a salesman he can adjust the conversation to get an idea of the selling capacity of the article. Will the article be *bought* or *sold?* It has been said there are no life insurance policies bought—they are all sold, and sold by personal solicitation of salesmen. One can describe the article and the plan he has for selling as if he were considering taking an agency himself and ask the salesman for his opinion. "Knights of the Grip" are always ready to pass an opinion, pick up a side line, or while the time away in conversation, so he will tell of any similar article that he may have seen and how it was marketed. If he is favorably imprest, remember him for the future selling force. He may cite to you several ways of marketing this from cases that have come under his observation. It is a very good plan for the inventor to have a feasible selling plan worked out before trying to interest capital.

From a manufacturer one can get some idea of the probable cost of production, necessary equipment, etc. The cost of manufacture is always more or less a stumbling block, but it is one of the three great questions that investors always ask. These are: What does it cost to manufacture, what does it sell for, and how long will it take to get it going? One can, if he likes, submit the whole article to a manufacturer and have him bid on it. But it is preferable to see what the cost of standard parts will be from a trade catalog, get bids on the other parts from screw machine works, stamping concerns, or others specializing in making parts. They will bid on the part in any quantity named from a blue print.

There is a type of man that one is bound to find in his travels, namely, the man with a lot of ideas. He will quickly commence: "I'll tell you what I would like to see and what I would buy if I could find it. I believe it can be done. It's a wonder to me some one has not done it already."

Such a man is often wide awake—he sees

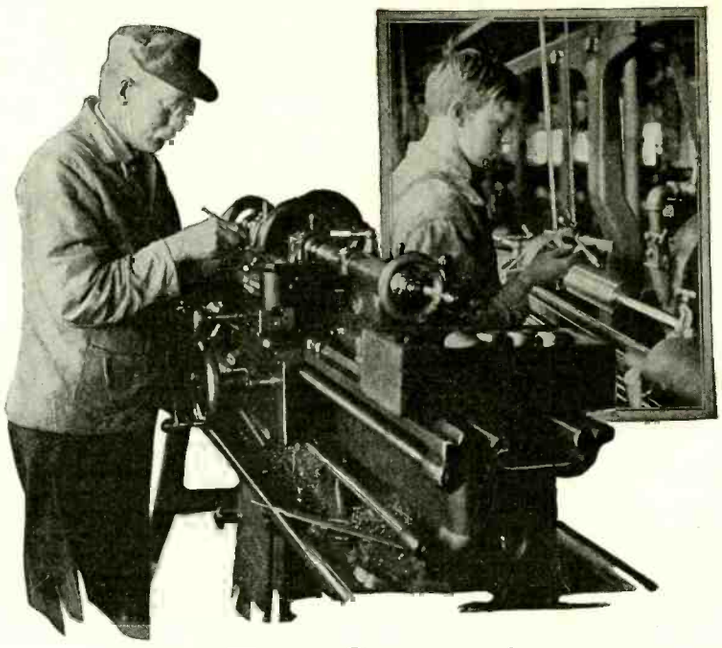
Under-Water Surveying by Reflected Sound Waves

By H. Winfield Secor



(*Continued from page* 454)

We remember one scientific investigator who could hear sounds as high as 38,000 cycles per second.

As Mr. Ries demonstrated, it is very remarkable how accurately a sound can be located, such as a blast from a whistle, if two short curved horns about one and one-half or two feet long are held tightly against the two ears, as shown in one of the accompanying illustrations. Should someone sound a whistle quite a distance away and you then swing your head from side to side, you will quickly ascertain that there is one certain position which will be found to be at right angles to the direction from which the sound emanated, in which a *maximum response* will be heard. It is possible that this method could be used to make a simple *range-finder* for military or other requirements. A very beautiful principle of pure physics was further mentioned at this juncture, and one that probably not one person in ten thousand ever thinks about. It deals with *sight* instead of sound, and the principle of triangulation is clearly illustrated thereby. Mr. Ries said: "Show me a good artist or draftsman and I will show you *the man who possesses abnormally separated eye-balls.*" This does not mean the eye-balls are divergent or convergent as in stigmatism, but that two normally straight eyeballs, having the most accurate observation possibilities, of extreme importance in all perspective drawing and painting, was here enhanced by the fact that the possessor of such a pair of eyes had a *longer base* for his triangulation of sight on a given object than the average man, or one whose eye-balls were spaced abnormally close. This fact is brought out pointedly by referring to the accompanying illustrations. If you are familiar with the laws of simple geometry and trigonometry, or else with the operation of the range finders now in use by the Army and Navy gunners, you will see that the reasoning is correct, and of momentous import indeed.

Mr. Ries's Under-Water Sound Detector.

There are two general methods by which Mr. Ries's highly perfected system of surveying may be carried out by means of sound waves. In the first method it may be applied in charting or surveying a given body of water and ascertaining the formation and character of bottom. In this case it is only necessary to provide at the receiving or measuring station a beam of known length on the extreme ends of which are placed two of the improved sub-aqueous microphones with balanced diaframs, perfected by the inventor. A sound projecting horn is sounded at pre-arranged intervals, and readings are taken as the apparatus is moved from point to point. In order to measure the range quickly, the two pivoted microphones are connected by means of gearing or rods with a calibrated dial placed in the center of the beam supporting the microphone sound detector. This dial moves proportionately to the movement of the microphone, and always gives the appropriate reading for identical angular positions of the microphones. The diaframs of Mr. Ries's subsea microphones are accurately balanced against the water pressure by comprest air, the pressure of which is automatically varied to a nicety in proportion to the pressure of the water, which, of course, increases as the depth of submergence is increased. The horns fitted on to the front of the microphones may also be attuned to a certain frequency.

For Two Generations

BOYS

Learn Drafting

Employers everywhere are looking for skilled draftsmen. They are offering good salaries to start with splendid chances for advancement.

Drafting offers exceptional opportunities to a young man because drafting itself not only commands good pay, but it is the first step toward success in Mechanical or Structural Engineering or Architecture. And drafting is just the kind of work a boy likes to do. There is an easy delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving boys just the training they need for success in Drafting and more than 200 other subjects. Thousands of boys have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon, then mark and mail it. This doesn't obligate you in the least and will bring you information that may start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon now.

FUNK & WAGNALLS COMPANY, Dept. 313, NEW YORK, N. Y.

Where it is not possible to utilize a distant direct source of sound, as in measuring the distance of an iceberg, etc., then *reflected sound signals are used*. As afore-mentioned, a powerful siren or bell is now placed midway between the two microphones, and this is operated in the following manner: By means of an automatic *double contact switch* when the siren or submarine bell is sounded, to send out the *originating* sound signal, the circuits of the receiving microphones are automatically disconnected so that the powerful sounds being transmitted are not picked up, which would prove confusing, if for no other reason. After the signal has been sent out for a few seconds, the switch is thrown to "receiving," and the microphone circuits are re-connected. By this time the sound has died away at the transmitting station, and is being propagated toward the distant point from which the reflection is sought. After a few seconds, and during which time the pivoted beam supporting the two microphones is swung back and forth continually, a sound will be heard which is the echo, if there has been a reflection of the sound, and of course, if there is no reflection or echo, then no sound will be heard. The distance which the echo has traveled can be checked by a stop watch or other chronometer, dividing the time elapsed in seconds before the echo is heard, by two, and then multiplying this value by 4,700, which gives the range in feet. This is not necessary, however, as the automatic range reading scale connected to the two pivoted microphones is calibrated to give both the distance and position directly, once the beam has been swung so as to be at right angles to the point of the original sound, or in the present case the point from which the echo was reflected.

One of the accompanying views shows a diagram of Mr. Ries's *differential sound receiver* for this purpose, and its operation is very ingenious indeed. A differentially wound telephone receiver is used, provided with two windings or coils, one of the receiver coils connecting thru an induction coil as shown to one microphone, while the second receiver connects thru another induction coil and shunt circuit to the second microphone. What happens when a sound is received, is interesting. No sound is heard at all in the receiver, for the following reason:—When the microphones have been properly focust and the sounds localized and picked up in each microphone unit are equal in strength, then the currents passing thru the induction coil circuit to the two differential windings in the telephone receiver are arranged so that they neutralize one another, and as a consequence no sound is given forth by the receiver diafram.

An exceedingly important and timely application of Mr. Ries' invention is that brought about by the World War that is now happily ended, namely, the location and recovery of many of the numerous and costly warships and merchant vessels sunk by submarines, mines, etc., amounting, according to recent estimates,* to more than 18,000,000 tons out of a total world tonnage in 1914 of 42,000,000 tons. Among the original purposes which Mr. Ries had in view in devising his apparatus was the location and salvage of vessels and the preliminary study and charting of their position and condition, *from the surface*, by means of the reflected sound waves which were brought to a focus upon and caused to travel in exploration along the entire exposed part of the vessel, and also over the ground on which she lay. In this manner not only the exact depth and position of the ship is ascertained without the use of a diver, but every part of the ship is plotted as the survey proceeds. A three-funneled steamship, for example, with the widely separated sound receiver horns brought to *a spot focus* upon it, will give

three characteristic echoes as the pivoted exploring arm is moved.

Ries Balanced-Flame Sound Detector.

In this case two manometric flames, as shown in the accompanying illustration, are separated by an opaque partition inside of a ventilated glass bell or other cover. The two flames are adjusted to burn with equal brilliancy, and pneumatic comprest air tubes provided with appropriate needle tips are placed at the side of either flame. These two pneumatic tube systems, which are used to cause either of the flames to vary or quiver, are suitably connected to the two receiving microphone-telephones. While the microphones in this case are being focust, there will be a fluctuation of the flames until the beam is accurately focust and the sounds of the telephones are of equal strength, when the flames will become balanced, and each will burn with equal brilliancy and shape.

An interesting experiment, which the reader may like to conduct, is that of causing a focust sound wave to be propagated across a room, and then listening for the focust ray. This will demonstrate one of the principles on which Mr. Ries's invention works. To perform this experiment, all you need is a common garden variety of watch, such as a dollar Ingersoll, which gives a good healthy tick, and this may be placed in a parabolic or other reflector, or even a china oatmeal bowl.

Experimental Under-Water Signaling System.

All that is required for making this experiment is a water-tight tin box, in which is mounted a small buzzer. This buzzer may be soldered to the inside of the metal box, which may be a cocoa tin. The two wires carrying battery current to the buzzer are carried out thru the top of the container thru a piece of small rubber tubing. Where the rubber tube enters the box the joint may be tightly sealed by the liberal application of hot sealing wax. The lid of the box may be sealed tight by thoroly waxing with paraffin.

The receiver is of the microphone type, and any electrical experimenter will be able to make this device very easily with a little ingenuity. There are several ways in which it may be done. The first requisite is a sensitive carbon microphone. A Skinderviken microphone button, which is complete in itself, may be used, attaching it firmly to a ferrotype (iron) diafram about 2¾ inches in diameter. It is best to place solder over the nut on the water side of the diafram to keep the inner chamber of the receptor thoroly water-tight. The receptor may be mounted on a piece of pipe or a metal rod, so as to be suspended over the stern of a rowboat or launch, and provided with a handle so that the microphone and its attached metal horn can be swung in different directions. One side of the circuit may be completed thru the metal suspension of the microphone apparatus, and the other side of the circuit thru an insulated wire leading up above the water thru a rubber tube. All joints around the microphone should, of course, be made water-tight, but this is not very much trouble where a simple experimental apparatus is under consideration. The microphone diafram should be fitted with substantial rubber gaskets on front and back, and then the base of the horn and the rear casing of the microphone thoroly bolted together to form a compact whole by means of a number of small stove bolts or machine screws and nuts placed around the perifery of the chamber, as shown in the drawing. This is due to Christian Berger.

An ordinary 75-ohm telephone receiver, or a pair of them, are connected up with a dry cell or two in circuit with the microphone at the receiving station. All is then ready to try out the transmission of sound signals thru water.

DETROIT
The Auto Center is the Logical Place To
LEARN AUTO AND TRACTOR BUSINESS
Training for Head and Hand
Trained men are needed everywhere to test, repair and give expert advice on care and handling of automobiles, trucks and tractors. Big money for M. S. A. S.-Detroit trained men. Good jobs or independent businesses await our graduates. Opportunities unlimited.
Earn $100 to $400 Monthly
Our Course will teach you how in a few short weeks. Most complete, comprehensive and up-to-date Course known. Wholly practical. No job too hard for our graduates. Every phase of work covered. Actual experience given on dozens of different cars. Entire equipment best obtainable. Instruction includes complete Tractor Course. Brazing, Welding and Tire Repairing taught separately.
Learn in Detroit — Start Any Time — Our Graduates in Demand
Here you get the benefit of finest co-operation of biggest factories. They know the thoroughness of our Course and gladly help our students in every way possible. Almost daily we have calls for graduates to fill responsible positions. School open all year. Enter classes any time. No need to waste or lose a moment.
Money-Back Guarantee
We guarantee to qualify you for a position as chauffeur, repair man, tester, demonstrator, auto electrician, garage man, automobile dealer, or tractor mechanic and operator, paying from $100 to $400 monthly, or refund your money.
Big Factories Endorse Our School
They know what we do--how we teach, and the type of graduates we turn out and give our students unusual assistance. Every instructor an experienced man--one who knows and is able to teach others.
MAXWELL MOTOR COMPANY
DETROIT, MICH.
Mr. James Williams, 20 Lincoln St., Gloversville, N. Y.
Dear Sir:--Your letter of February 2d, making inquiry regarding the Michigan State Auto School received.
Wish to say that this is one of the best schools in the country, and would not hesitate to recommend it to anyone. It is a recognized institution among the Automobile factories of this city. We have a great many graduates from this school in our employ and every one has given entire satisfaction.
Very truly yours,
MAXWELL MOTOR COMPANY, Inc.

What 15c will bring You from the Nation's Capital
Washington, the home of the Pathfinder, is the nerve center of civilization; history is being made at this world capital. The Pathfinder's illustrated weekly review gives you a clear, impartial and correct diagnosis of public affairs during these strenuous, epoch-making days.
The little matter of 15c in stamps or coin will bring you the Pathfinder 13 weeks on trial. The Pathfinder is an illustrated weekly, published at the Nation's center, for the Nation: a paper that prints all the news of the world and tells the truth and only the truth; now in its 26th year. This paper fills the bill without emptying the purse: it costs but $1 a year. If you want to keep posted on what is going on in the world, at the least expense of time or money, this is your means. If you want a paper in your home which is sincere, reliable, entertaining, wholesome, the Pathfinder is yours. If you would appreciate a paper which puts everything clearly, fairly, briefly—here it is. Send 15c to show that you might like such a paper, and we will send the Pathfinder on probation 13 weeks. The 15c does not repay us, but we are glad to invest in new friends. The Pathfinder, Box 76 Washington, D.C.

CORE WIRE

We have been fortunate in securing thru auction several tons of guaranteed pure, double annealed **Norway Iron Core Wire** and are selling this wire to "Experimenter" readers

At Pre-war Prices, 20cts. lb.

This wire is just the thing for spark coils, transformers, etc., and it is, of course, a very much more superior product than the usual iron wire.

We have only one size left:
24 INCHES LONG.
Thickness about No. 21 B and S

If this size should be too long we advise cutting the wire down yourself by means of shears.

As long as the supply lasts we offer this wire as described above to our customers at the very low price of 20c a pound.. Add postage or we will ship express collect. Order at once.

Electro Importing Co., 231 Fulton St., N.Y.C.

"Audions on A. C." Correction

In the article entitled "Operate Your Audions on A. C.," by Elliott A. White, published in the July issue of the ELECTRICAL EXPERIMENTER, page 234, an error occurred in the statement of the formula in the center column of page 234. The multiplying factor in the numerator of the equation should have read 6.25 instead of .625. Also the second line at the top of column three should have read 1 ampere instead of 0.5 ampere.

We are pleased to add the following information contributed by Mr. White since the publication of the original article, and which we believe our Radio friends will be very glad to procure, especially in view of the high technical standing of the author, who was formerly Radio instructor at the *Carnegie Institute of Technology*. The additional information follows:

"If the tubes of the rectifier are of the high internal impedance type, they must pass at least as much current as is required by the plate circuit of the receiving tubes; and if the tubes of the rectifier are of the low internal impedance type (such as the G. E. Co.'s *Tungar* tube), a current-limiting resistance should be inserted in the lead from the middle of the transformer windings T3 T4, to protect the tubes. As the filaments of these tubes require only 2 volts, but a correspondingly heavy current, the transformer windings T5 T6 would have to be wound for 2 volts with heavy wire. There is another simple way of connecting the rectifier to the transformer, whereby all the windings are in series and the plates in parallel, but to avoid confusion this method is not given. Any connection or design adopted by the experimenter is satisfactory, so long as it is adapted to the kind of tubes used, whether they are transmitter tubes, receiver tubes, commercial tubes, or home-made ones."

TRENCH USE OF TELEPHONE WIRE.

Telephone wire is the *sine qua non* of the trenches. It is used to hang pictures on the walls of the dugouts, to mend cots and to make them. Men who have been "over there" have said that frequently soldiers have stopt in their pursuit of the Hun to gather bits of telephone wire lying along the blood-soaked fields of No Man's Land.

De Forest Defends His Three-Electrode Audion

(*Continued from page* 428)

gave off torrents of negative electricity. This discovery was made before anything was known of electrons, but Dr. Fleming had persisted in his efforts, directed towards rectifying alternating high frequency currents, and eventually by an exceedingly pretty contrivance, was able so to control and study the current as to suppress all the oscillations in one direction by the Fleming valve. This was improved on later by Mr. Marconi, and the present three-electrode valve, with its contrivances for audio-magnification, three times repeated, was finally evolved. Two currents being coupled and exalting each other made an exceedingly sensitive detector, and the lecturer remarked that this might be tested by placing the receiver and the transmitter of a telephone together, when all the little noises in the room were picked up and a whistling sound produced. Thus, with the modulation of the waves to the human voice, the problem of radio-telephony was solved, and great developments were to be expected.

"Conversation with ships would be practicable, as man to man in the same room, and also Trans-Atlantic telephony. The Premiers of the Dominions would, he anticipated, be able to take part in a cabinet meeting in London by vocal intercourse, tho their bodies were thousands of miles away."

The protest of Dr. de Forest is contained in the following letter:

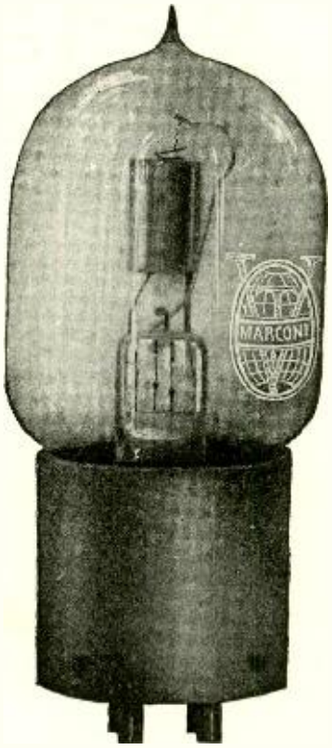
Editor of *Morning Post*,
London, England.

Sir:

I have just read the paragraph in your issue of February 25th entitled "The Future Telephone," a resume of a Cantor lecture by Prof. Fleming. Prof. Fleming's lectures have usually been so clear and instructive that I am astonished to see him now quoted as having made statements widely at variance with well known facts. In the recent testimony before Mr. Justice Spencer in the unsuccessful attempt before his court by the Marconi Company experts to prolong the "Fleming valve" patent it was admitted by the Marconi experts (Prof. Fleming himself being present at the trial) that the Fleming valve did not amplify, that it only rectified the weak currents received in wireless signalling.

As a matter of fact, well known to radio engineers, the true Fleming valve has itself been of exceedingly small value in the modern wireless art. And Fleming did not improve it. It is a three-electrode vacuum tube, called by myself, shortly after its invention, the "Audion," which, if I may say it in all modesty, has brought about all those wonderful advances in radio signalling.

The Audion and not the Valve made possible the trancontinental wire telephony —the Audion and not the Fleming Valve, used as an oscillator at the transmitter, and as detector, and then amplifier at the receiver stations made possible transoceanic radio telephone in 1915, and again this year between New Brunswick, N. J., and the S. S. *"George Washington"* in Brest Harbor.



I cannot believe that a scientist of Prof. Fleming's standing would knowingly lend his name to any deliberate attempt to mislead the public in stating, or artfully inferring that Marconi improved the Fleming valve and produced the three-electrode device. Neither do I believe that a paper of the standing of the *London Morning Post* would knowingly lend its columns to any unfairness or pettiness in withholding the credit due an American inventor, altho there always has been and there still is plenty of evidence to show such an unfair and petty attitude on the part of certain British interests, especially in the United States. Marconi had no more to do with inventing a three-electrode device or Audion than the Kaiser, altho both have made good use of it, since an American produced it and demonstrated its limitless possibilities.

In the interest of fair play and scientific fact, I ask you to publish this communication. (Signed) LEE DE FOREST.

MARCONI V. T.

$7.00 each

Standardized Socket - - - - - -- - $1.50 additional

Agreements recently effected have made vacuum tubes available for experimental use. The Marconi V. T. is the only vacuum tube, or audion, which may be sold to amateurs, laboratories, schools of instruction and experimenters.

A highly developed, all-around tube for use as a detector and amplifier in wireless communication. It has practically the same electrical constants as the tube used by the Allied armies and navies throughout the war in continuous wave transmission and reception.

The preferred detection circuit for the Marconi V. T.

The Approximate operating life of the MARCONI V. T. is 1,500 hours.

Class I—Designed for use as a detector; operates with plate potential of 20 to 60 volts.
Class II—Designed for use as an amplifier; plate potentials from 60 to 110 volts may be applied.
Tubes in either class may be used for detection or amplification, but those of Class I are best as detectors, and Class II tubes are superior as amplifiers.

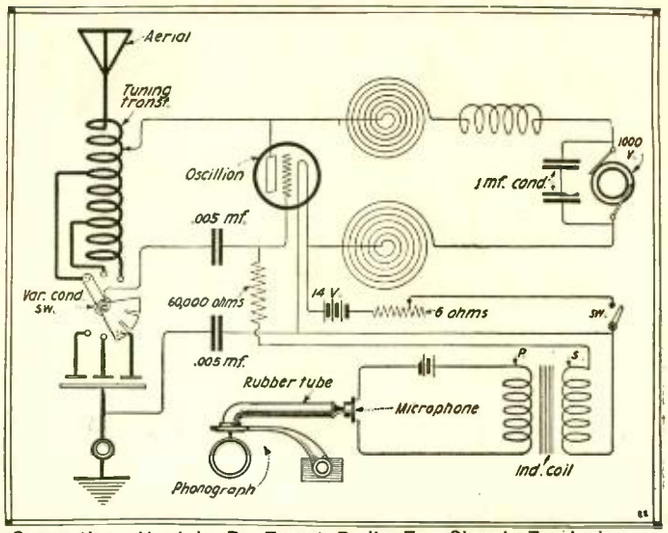
The "Fog Warning" Radio Telephone

(*Continued from page* 426)

third repetition the warning, "You are getting closer, keep off!" is sent out with a limit of range of about two miles. These signals are sent out during fog, mist, rain, and falling snow.



When sent out by *radio* the signals can be heard with any suitable or well-known wireless telegraphic telephonic receiving apparatus which may be employed to receive, detect, or reproduce the emitted or radiated signals. Crystal detectors may be used. The signals are sent out now on a first wave length of 600 meters.

If the transmitting and receiving apparatus is equipt for graduated strength musical note signals, these will be received by a ship at sea; for instance, suppose the ship receives the note corresponding to the Middle "C"; then it will be known that the lighthouse is four miles away.

If both the middle "C" and the "E" and "G," are detected at the receiving station, the distance is two miles, and if all four notes are heard, then the distance away is one mile or less, and so on for any other pre-arrangement and adjustment of the sounding apparatus.

This invention is bound to be a great help to all mariners and the system is a direct innovation over any that have heretofore been tried. Doubtless many disasters and wrecks will be avoided and in general to make navigation safer.

Every important lighthouse and lightship on the U. S. coasts will be fitted with this new Radiophone "fog signal."

Connections Used in De Forest Radio Fog Signal, Employing an Oscillion Bulb to Generate the Transmitting Oscillatory Current.

EMIL J. SIMON WINS CANADIAN LAWSUIT.

The Marconi Wireless Telegraph Company of Canada, Limited, the plaintiff in a Canadian radio patent suit, recently released and discharged the American Wireless firm of Emil J. Simon from and against all claims and demands set forth in the Statement of Claims, and further stated in their disclaimer that it will not institute any other proceedings against the defendant, Emil J. Simon, in respect thereof. This notice was dated Montreal, June 7th, 1919.

A competent English authority says that English central station managers realize that lighting is fast becoming the small end of the electric central station's income, and power and appliances are to be the main sources of revenue in the future.

The How & Why of Radio Apparatus

By H. Winfield Secor

(*Continued from page* 431)

comprising a four-wire inverted "L" aërial, the wires being spaced about 2½ feet apart.

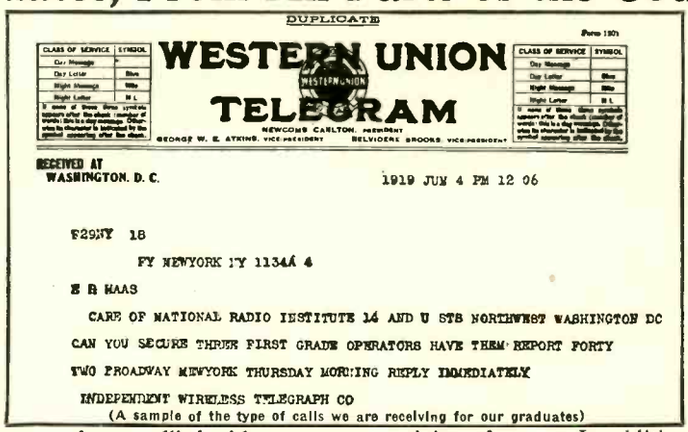
However, where long distances are wanted, it becomes necessary to use longer aërials.* The reason for this is that, to gain the highest maximum results in any radio transmitting or receiving circuit, the antennae oscillatory circuit down to earth should be able to vibrate at a frequency approximating its natural period. Hence, it is seen that for this reason, it is necessary to use a long aërial, having in consequence a long wave *natural period* in order to pick up efficiently such wave lengths as 12,000 or 15,000 meters. This is not the whole story, either, for another important factor is that the longer the aërial, the more energy will be picked up from the rapidly moving etheric wave front, as it passes across the antenna wires. This may be compared for analogy to the electromagnetic field. In a dynamo or motor you will recollect that the longer the wire, the more magnetic flux it will intercept in its rotation in the field, with a consequent greater potential produced in the moving conductor. In the case of radio transmission, the conductor is stationary, while the electrostatic field moves and thus cuts the wire, inducing an electric current in the wire. It is this induced current which operates the detector in the receiving set.

*See "Calculation and Measurement of Inductance"—in the September, 1917, issue of this journal.

As a guide to the young radio designer, the accompanying graph chart is given, which shows the natural wave lengths of four-wire antennae of various heights and lengths. These values were computed from data given by Dr. Louis Cohen. A common rule for calculating approximately the wave length in meters of a simple antenna system, without any coils or other apparatus connected with it, is to multiply the length of the flat-top, plus the length of lead-in wire to earth, in meters by 4.5. This rule applies to inverted "L" type aërials. It is also applicable to "T" type antennae, but here the length of wire considered in meters is the lead-in length to earth, plus *one-half the length of the flat-top.* The factor 4.5 varies under different conditions, as, for instance, where metal roofs may change the natural capacity of the antenna. But it serves very well for approximation, and has been very extensively used.

Mathematical Calculation of Antennae Wave Lengths.

In a previous paper the writer had the following to say in regard to the wave length of radio antenna and the value of tuning inductances in the aërial oscillatory circuit.



Having theroly discust the methods of both calculating and measuring the inductance of coils, we are now in a position to continue with the design of the most im-

Salaries Up to $250 A Month

With exceptional opportunity for promotion to Radio Mechanic, Electrician, or Engineer. No previous experience or training is necessary. You can learn Wireless the National Radio Institute way, in Ten Weeks, by mail, right in your own home. With our help you can quickly qualify for a good position at big play. Many of our students secure positions before completing the course, because it is based on actual practice and teaches what is needed to make a big success of Wireless work.

Get Your Instructions from the Nation's Capital

(Our Course is Endorsed by the U.S. Goverment Officials)

The National Radio Institute headed by authorities who have been closely allied with government training of students, was established in 1914 and is the first school in America to successfully teach Wireless by Mail. The work is under the direction of J. E. Smith, E.E., director of the Radio Department Howard University, and E. R. Haas, formerly of the Radio Division of Yale University.

We now have students throughout the world. Our location in the Nation's Capital together with the standing of our officers and their wide acquaintance among government officials connected with Wireless activities place us in position to give our students the best instruction obtainable and to be of the utmost help in assisting them to secure good paying positions.

Travel and See the World

If you want to travel and see the world—go to foreign countries, and increase your knowledge of world affairs Wireless offers you the chance of a lifetime. However, you are not obliged to travel, but may secure a permanent position at one of the big Land Stations, Railroad, Telegraph, or Steamship Companies if preferred.

Pay As You Learn

Our plans of payment bring a wireless education within the reach of anyone who desires to learn. A small payment down on our convenient payment plan, and small following payments, often enables our students to earn the cost of their tuition while actually learning to be a wireless operator.

Free Instruments to Every Student

In addition to 5 text books—35 Special Lessons, and 18 Personal Examinations we send you, while taking our course a Standard Automatic Wireless Transmitting and Receiving Set for sending and receiving messages. These fine instruments are Free only to National Radio Institute Students.

Oldest Wireless School in America

In addition to being the oldest and largest Wireless School in America our location in the Nation's Capital enables our Students Employment Department to keep in close touch with the best openings for our graduates. A Post Graduate Course is given Free to every graduate. Special discounts are allowed to discharged soldiers, sailors, and marines with former wireless experience and to Radio amateurs.

Representatives wanted to help introduce our course to wireless enthusiasts

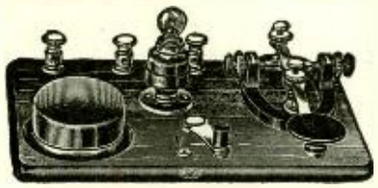
Wireless Receiving Ban Raised

MESCO WIRELESS PRACTICE SET

The Practice Set comprises a regular telegraph key, without circuit breaker, a special high pitch buzzer, one cell Red Seal Dry Battery, and four feet of green silk covered flexible cord.

The key and buzzer are mounted on a highly finished wood base, and three nickel plated binding posts are so connected that the set may be used for five different purposes.

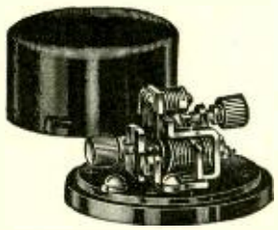


List No. Price

342 Telegraph Practice Set, with Battery and Cord $3.24

Weighs 4 lbs. packed.
Price does not include postage.

MESCO — Combination Practice Set for Learning the Morse and Continental Visual and Audible Codes



This outfit is the only reliable instrument which will enable students to become proficient operators in the U. S. Naval Service, because it is equipped with a buzzer and miniature lamp enabling the user to master both the visual and audible signals quickly.

List No. 52—Practice Set with Red Seal Battery and Cord $4.05

Weighs 4 lbs. packed. Price does not include postage.

MESCO RADIO BUZZER

This buzzer maintains a constant note and is recommended as an exciter for checking wavemeters where pure note and ample energy are required.

It consists of practically a closed circuit field of low reluctance, having a steel armature to which is riveted a strap supporting a movable contact. The armature tension is adjustable by means of a screw with a milled head large enough to be easily and permanently adjusted with the fingers. The stationary contact is adjusted by means of a similar screw. The magnet coils are connected in series with a total D. C. resistance of 3.9 ohms. Shunted across these coils is a resistance having a D. C. value of 3 ohms. This shunt eliminates all sparking such as occurs at the break on ordinary radio buzzers and the energy saved thereby is transferred into any oscillating circuit connected to it, the result being that this buzzer as constructed radiates five times more energy than any other existing type. All connecting wires liable to be broken are eliminated. Contacts are of genuine platinum, which is essential in order to maintain a constant note. The parts are mounted on a Condensate base to insure constancy in operation.

Diameter 2 in., height 1¼ in. The cap is attached to the base by a bayonet joint.

List No. Price

55 Mesco Radio Buzzer $2.05

FOUR FAMOUS BOOKS

Wireless Course in 20 Lessons

By S. Gernsback, A. Lescarboura and H. W. Secor. E. E.

A course that tells you everything you can possibly want to know about "Wireless". The mysteries of "Wireless" are unfolded to you by the use of such simple language so skillfully used that of necessity you must understand every word. The subject is not treated superficially, however, for there is a whole lesson devoted to the Theory and Mathematics of this epoch marking subject.

Size of book is 7 x 10¼ in., 160 pages, 350 illustrations, 30 tables.
Flexible cloth cover....per copy $.50
Stiff cloth cover.....per copy 1.00

Experimental Electricity Course in 20 Lessons

By S. Gernsback and H. W. Secor. E. E.

A Course of the theory and practice of Electricity for the Experimenters. This is undoubtedly one of the most complete and comprehensive treatises of this special subject ever published. The book is written by the same authors as the famous "Wireless Course in 20 Lessons".

Every phase of experimental electricity is treated comprehensively in plain English.

The book contains 160 pages and more than 400 illustrations.

Flexible cloth cover...per copy $.50
Stiff cloth cover.....per copy 1.00

The How & Why of Radio Apparatus

By H. Winfield Secor

(Continued from page 462)

portant type of inductance coils used in radio work. We will confine ourselves to the types of coil which are mostly used, namely—loading inductances, loose couplers, variometers and transmitting oscillation transformers.

Before we delve into the actual design of these coils, however, let us first consider the fundamental facts necessary for the design. Since the inductance is employed in building up the proper oscillating condition of the circuit and consequently the wave length, we can express this relation by the following formulæ:

We have first the formula expressing the wave length, *W.L.*, of the open (antennae) oscillatory circuit, thru the primary, L_o, of a loose coupler, loading or tuning coil.

$$W.L. = A\sqrt{L \times C}\ ; \qquad (1)$$

where:—

A = a variable, ranging from 38.15 to 59.6 for short wave length. (See curves for various values of *"A"* in article cited below in February, 1917, issue.)

L = total inductance in centimeters of aërial, including lead-in and loose coupler, tuning coil or loading coil.

C = capacity in micro-farads of aërial, including lead-in.

Those interested in this subject should refer to the excellent article on "The Design of Large Radio Receiving Transformers," by C. S. Ballantine, in the February, 1917, issue of this journal, page 732. The variable factor, 59.6, appearing in the usual wave length formulæ was there discust at length, with a graph giving the different values of this function for various wave lengths and aërial inductance to localized inductance ratios.

Considering long wave lengths (10,000 meters and higher) and the design of large loose couplers we are safe in using the expression:

$$W.L. = 59.6\ \sqrt{L \times C}\ ;$$

where:—

L = inductance of loose coupler primary and loading coil (if used); the inductance of the antennae being neglected, owing to its small value compared to the inductance of the loose coupler (or loading coil).

C = Capacity of antennæ, including lead-in.

For designing short wave apparatus we shall call L_o the value of the loose coupler (or tuning coil) primary inductance. Then we have:

$$L_o = \frac{\lambda^2}{3552 \times C} - L\ ; \qquad (2)$$

here:—

L_o = inductance of load (loose coupler, tuner, etc.), in centimeters.

λ = maximum wave length to be tuned to.

L = inductance of antenna and lead-in in centimeters.

C = capacity of antenna and lead-in in micro-farads. (See tables herewith for these values.)

For long wave apparatus, let L_o represent the loading coil inductance, plus the inductance of the loose coupler primary (or tuner, if used). Then we have the formula:

$$L_o = \frac{\lambda^2}{3552 \times C}\ ; \qquad (3)$$

with all values the same as in formula No. 2.

The following tables will be found useful in applying the above equations to the design of loose couplers, etc.:

TABLE "A"

Cap. in M.F., Including Lead-in, of 4 Wire Inverted "L" Aerials. Wires Spaced 3 Ft. Apart

Height	Length of Flat-top in Feet			
	60	80	100	120
40....	.00033	.00042	.00051	.00060
50....	.00035	.00043	.00050	.00058
60....	.00036	.00044	.00051	.00059
70....	.00037	.00045	.00052	.00059
80....	.00039	.00046	.00053	.00060
90....	.00040	.00048	.00055	.00061
100....	.00042	.00049	.00056	.00062

TABLE "B"

Inductance in Cms., Including Lead-in, of 4 Wire Inverted "L" Aerials

Height	Length of Flat-top in Feet			
	60	80	100	120
40....	35,000	41,100	47,200	53,310
60....	48,800	55,460	62,090	68,700
80....	62,400	69,320	76,300	83,300
100....	76,260	83,500	90,750	98,020

It is possible to determine approximately the inductance required to produce a desired wave length when the capacity of the total oscillating system is known. When using any of the above formulæ, it should be remembered that they include the *total value* of the unit. Thus, the capacity factor includes the antenna, and condenser capacity, each of which must be determined separately and the capacity of the antenna must be obtained by actual calculation, formula for deriving this quantity having been given on page 732 of the February, 1917, issue of this journal, as well as a table of the capacities of a four wire antennæ of different lengths and heights.

The first step in the design of an inductive tuner (having determined the wave length) is the actual size of the instrument, and from this to find the approximate dimensions of the winding tubes to be used. Having these on hand, and knowing the maximum inductance of the primary by equations (2 or 3), we can immediately determine the number of turns that the primary coil will require to obtain the wave length sought, by solving equation (3) of (Part 1, March, 1917, issue) for *N*.

The inductance of the secondary winding should be such that its wave length should correspond very nearly to the antenna circuit, and that of the primary. If this condition is to be obtained, then we have an ideal condition of maximum efficiency and great care must be exercised in bringing about this ideal condition. The value of the secondary inductance must therefore be in the neighborhood of the primary (unless it is to be shunted by a variable capacity), but in practise it is made somewhat larger than that of the primary. It is customary in coupler design to allow one-half inch difference in size of diameters between the primary and secondary tubes and therefore the diameter of the secondary can readily be determined The number of turns required is deduced from equation given in the September, 1917, issue.

Details of Aërial Construction.

When it comes to discussing details of amateur aërial construction, one could almost write an encyclopedia of several volumes, for in traveling about the country, it is amazing to note the many different ideas followed in building antennæ. This is so for many reasons, not simply because one Radio Amateur wishes to have something different from his fellow Amateur across the street, but in a great majority of cases his pocketbook controls the design. And so it is that instead of using beautifully molded ten-inch Electrose insulators on his aërial, you may perchance bunk into one of the greatest freaks of modern times, a real dyed-in-the-wool Amateur antenna—constructed from about six kinds of wire, including some good old iron hay-baling wire, and a variety of insulators that would win first prize in any freak photo contest, made from miscellaneous odds and ends,

"ASK ANYONE WHO HAS USED IT"

WENT THROUGH CHATEAU-THIERRY, ARGONNE AND MEUSE OFFENSIVES

A soldier who used a Brandes Headset all through the war brought it to us for slight repairs afterward. He *knows* that a Brandes is the best that can possibly be made. You ought to hear him talk. (Name on request.)

ELECTRICAL ENGINEERING

Bachelor of Science Degree in Three Years. Accomplish your electrical ambition. Three years of intensive conscientious study here will train you to become an Electrical Engineer with a degree of Bachelor of Science. Electrical industry demands technically trained men—engineers. At home or abroad the field is widening by leaps and bounds.

Forty professors, expert in their lines, form our faculty. They are leading hundreds of ambitious young men to sure Success. **Why not you?**

In fully equipped laboratories, shops, drafting rooms and recitation rooms day by day you will become fully prepared to engage in the profession of Electrical Engineering.

Fall Term Opens Oct. 1st

"Earn While You Learn" if you wish. Full provision for securing deficient high school credits.

Clip the coupon now for a "Photo Story" book and bulletin of the College of Electrical Engineering.

HOME BATTERY CHARGING

means vitality and long life to your battery and anyone can do it with the

NEW F-F BANTAM BATTERY BOOSTER

which will fully charge any 6 volt storage battery eF-Ficiently from 100 to 130 volt 60 cycle alternating current lamp socket.

This is a new size of F-F Rectifier and similar to our standard F-F Magnetic Rectifiers which have been on the market for over 3 years. Thousands in use giving satisfactory service. Simple, safe, sure acting. Copper and carbon electrodes rectify the current. Capacity 6 volts 8 amperes. Shipping weight 10 pounds. Price complete with Ammeter and Battery Clips $15. Also F-F Battery Charging Rheostats that operate from Farm Lighting Plants and Direct Current Service.

Send check for prompt shipment via express or if via parcel post add sufficient for postage and insurance. Bulletin 12 on request.

RADIO AMATEURS

Do you want your radio station listed among the "long distance" amateurs? Our new type "R" 1 K. V. A. 25,000 volt Wireless Transformer will make your station efficient for "long distance" relay work. Write for our catalog 20 T describing complete transmitting apparatus.

Thordarson Electric Mfg. Co.

501 S. Jefferson St. Chicago, Ill.

including beer—excuse us, *near-beer*—bottles, porcelain cleats, waxed wooden rods, pieces of crockery and other choice bits of "backyard junk."

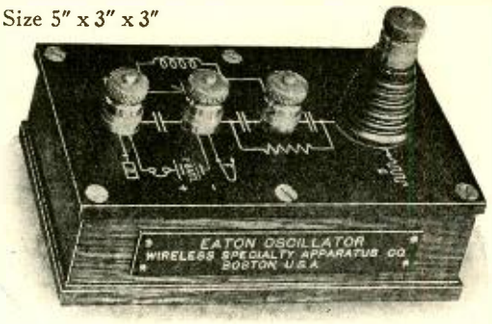
So it is seen that there is a wide latitude in ideas, and good ones, too, in many cases, let it be said, for building an experimental wireless antenna of fair efficiency. Your average Radio Amateur does not care so much about the "looks" of his antenna as he does about the fact as to whether or not he can sit down in his little coop with his apparatus about 10 P. M. and hear "Carnarvon" calling one of his Britannic Majesty's cruisers lying off the Canadian coast! That's the life that cheers.

Figs. 5 and 6 show several practical and approved developments in aërial design, which are not only efficient, but simple as well, in their application. Fig. 5 shows a typical elevated aërial spreader, which may consist of a length of stout bamboo, or a very good spreader is composed of cypress or oak sparring, about two inches square. The best shape for the spar is to make it about four inches broad at the center, so as to give it greater strength against bending. For ordinary work the Amateur usually winds several turns of wire around the spreader, and then fastens his insulators to it. A good construction, however, is afforded at very small cost by having a blacksmith (or else you can make them yourself) bend up a few eye-bolts, as shown in Fig. 5. These may be made from ⅜ inch round, wrought-iron bar, threaded at one end and provided with a washer and a nut or two. The iron and wood work on the aërial should be thoroly painted, of course, before erection, so as to withstand the weather. A heavy red or white lead paint is advised. If the antenna is to be used for "Receiving" only, four insulators are placed at both ends of the flat-top at the spreaders. Where the very highest efficiency is desired, extra insulators may be placed in the suspension ropes holding the spreader, as shown at X. This is the standard of aërial construction, but a much simpler form which has been extensively used in commercial practice, on ship stations particularly, is that shown in Fig. 6. Here no insulators are used in the flat-top part of the aërial proper, but they are placed in the main suspension ropes, as shown at X. This insulating scheme effectually insulates the aërial, of course, and a piece of brass or iron pipe may very well serve as a spreader, connecting the wires of the flat-top to the pipe, by winding the ends of the wires around it. It is the best practice to run a jumper wire across the strands, soldering this thoroly at the joints. This applies to the free end of the antenna; no jumper wire being required at the opposite end, where the lead-in rattails are led off. In any case all joints in the aërial circuit thru which radio frequency energy has to pass, *should be carefully soldered*, or else a very good design of clamp should be used, packing the cleaned wire joint with tin-foil before tightening the clamp. The jumper and rattail connections for inverted "L" and "T" type aërials are clearly shown in Figs. 1 and 2.

Kind of Wire to Use in Aërials.

"What kind of wire should I use for constructing my aërial?" "How many feet long?" and "What altitude?" are questions frequently repeated, and these are not simple ones, either. However, the Radio Experimental fraternity may count itself lucky in the respect that the size of wire for the antenna is pretty well standardized. For Amateur antennæ, it is common to use a wire corresponding in size to No. 14 B. & S. gage solid conductor. Where stranded cable is used, and which possesses a much lower *high frequency* resistance than a solid conductor of equal diameter (owing to its greater surface area, which

is the only part of the conductor traversed by the radio frequency currents), then a seven-strand cable is commonly employed. Seven strands of No. 22 or 24 wire constitute a common size of cable for experimental work, while a heavier cable is used in building commercial and Government stations. There are several kinds of wire in use for aërial construction. Aluminum wire was used previously, but it is very difficult to make a good soldered joint with aluminum wire, and for several other reasons it has not been used very much in latter-day practice. A very good wire for amateur work is a plain solid copper conductor, No. 14 B. & S. gage, or heavier, which may or may not be tinned. A good stranded cable for this work is one comprising seven strands of tinned copper wire. Another standard cable is a seven-strand one composed of phosphor bronze stock, which is of course very strong and suitable for the extra long spans. Still another form of wire in use for experimental aërial construction is copper-clad steel wire, which possesses greater tensile strength than any other equal size electrical conductor. The radio-frequency currents pass thru the outer copper jacket. Plain iron wire alone has been used, but is not very satisfactory.



Grounding Connections.

The matter of grounding antennæ, especially of the elevated type, is very important, markedly so in the case of *thunder-storms*. Also the *Fire Underwriters'* rules have to be carefully heeded in this respect, which apply to every building on which *fire insurance* is carried. The safest method to follow in any event, for your own protection, as well as keeping in conformity with the Fire Underwriters' rules, covers the following recommendations for the *grounding of radio antennæ*.

These regulations call for a ground wire connected to a first-class ground plate or pipe running down to damp earth, or to the street side of water mains in cities, this ground wire being composed of No. 4 B. & S. gage solid copper conductor. The ground wire connects to a grounding switch rated at 600 volts and 100 amperes. The regulations do not specify what size of lead-in conductors should be used, but it is apparent and obvious that if you intend to conduct a heavy static surge or induced charge from a thunder-storm down to earth thru this massive switch and ground wire, that you certainly would not make a lead-in of No. 14 gage wire, like so many amateurs have been wont to do in past years. The right way to do this is to construct the lead-in wire of No. 4 B. & S. gage solid copper conductor or its equivalent in cross-sectional area, such as by employing two or more wires of smaller size stranded together. Good Radio Engineering practice calls for rattail leads brought down from each strand of the aërial to be of equal cross-sectional area to the aërial strands proper, and then bunching these rattail leads into the lead-in joint at the bottom of the fan-tail construction. All of these joints, as aforementioned, should be SOLDERED. The rattail leads should be brought into an aërial connector of some kind before being soldered, so as not to depend upon the solder alone for mechanical strength or electrical conduction.

The *Fire Underwriters'* rules further stipulate that this lightning ground and switch should be placed on the exterior of the building in all cases, and furthermore, that this *ground* which has just been described in detail, should be separate from the station ground. It is the usual practice in experimental radio stations to place the aërial grounding switch either on the window-sill or on the side of the window, and, of course, it should be covered with a metal or other box, so as to protect it from rain

Size 5" x 3" x 3"

THE EATON OSCILLATOR
FOR EXPERIMENTERS

Designed to transform receiving circuits to receive arc and other undamped signals. It may be used across circuits whose inductance lies between .05 and 100 M.H. and whose capacity lies between .0003 and .005 m.f.

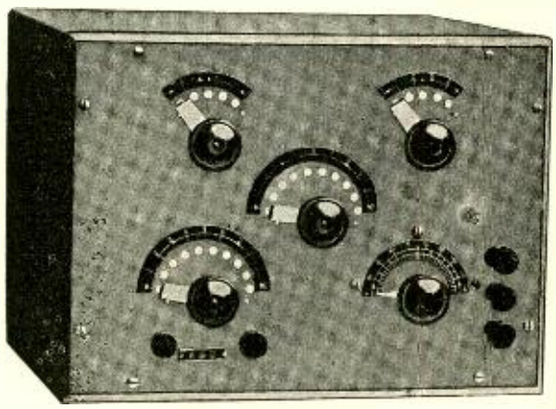
Requires no adjustments of any kind. Circuits are engraved on top. Only one variable, the tuning condenser, is required.

The simplest and cheapest way of receiving arc, tube and high frequency alternator signals.

PRICE $14.90 IMMEDIATE DELIVERY

THE .004 M.F. FARADON MICA CONDENSER

Comparative tests have proved the W.S.A. mica FARADON to be the best primary transmitting condenser made. FARADONS are built in .002 m.f. and .004 m.f. capacities. The .004 m.f. FARADON is tested for 30 minutes at 21,000 volts and 18 amperes in a circuit of 1000 meters electrical length.



The temperature rise during this period is less than 3.5°C. Every condenser is guaranteed for one year.

.004 m.f. FARADON $28.50 Immediate Delivery

WIRELESS SPECIALTY APPARATUS CO.
ENGINEERS, DESIGNERS, MANUFACTURERS
Boston, Mass., U. S. A.

UNIVERSAL RADIO APPARATUS

Type UL-5 Receiver

It is the policy of this company never to consider a sale completed until the customer is thoroughly satisfied. Incidentally our instruments seldom fail to satisfy, because they are scientifically designed and built on honor. If you are interested in radio apparatus of the highest grade at fair prices, enclose a 2-cent stamp for our catalogue.

Type UL-5 Receiver.

This is a complete receiver for undamped waves up to 17,000 meters. No external coils, couplers or condensers are needed, since it is entirely self-contained. Sizes 8" x 12" x 7" approximately.

We control the patent rights for the Mignon System and can supply these instruments.

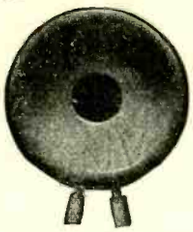
UNIVERSAL RADIO MANUFACTURING CORP.
Dept. W Elmira, N. Y.

AMPLIFY YOUR RADIO SIGNALS

With the new DETECTAGRAPH-TRANSMITTER, the amateur can amplify radio signals to such an intensity that he can hear the signals about his station without the need of the telephone head set.

By the addition of a loud talking telephone he is able to hear the messages many feet away from the instrument.

The super-sensitive DETECTAGRAPH-TRANSMITTER herewith shown is two and three-eighths inches in diameter, five-eighths of an inch thick and weighs less than three ounces. It is the most sensitive sound detecting device ever brought before the public.



The manner in which the amplifying process is attained is by attaching with tape the DETECTAGRAPH-TRANSMITTER to the regular wireless receiver.

Not only is this instrument applicable for amplifying radio signals, but it can be used with equal satisfaction for magnifying other sounds. Phonograph music can be transmitted from one place to another by means of this instrument, and those who are afflicted with deafness will find enormous benefit by using this transmitter. It is the greatest device for building your own loud talking telephone, detectagraph and other devices. Can be used for any purpose where a sensitive detecting instrument is required.

SUPER-SENSITIVE Detectagraph MICROPHONE DEVICES

Our Super-Sensitive Detectagraph Transmitter. Price, $7.00 Complete

Our Special No. 25 Loud Talking Receiver. Price, $4.00 Complete

Detectagraph Rheostat, especially made for amplifying circuits. Price, $2.00 Complete

Super-Sensitive No. 40 Receivers to be used in connection with Detectagraph-Transmitters, $10.00

The Detectagraph Junior Deaf-Phone $15

Equal to any $35 instrument made. Outfit consists of Super-Sensitive Transmitter with cord connector; Super-Sensitive Ear Piece with small black cord; Black Single Headband; Black Case and Two Batteries.

Model "B" Horn, with Loud Talking Receiver, Cord Plugs and Desk Stand Base. Price, $10.00 Complete

Model "C" Horn, with loud talking Receiver, Cord Plugs and Wall Base. Price, $10.00 Complete

Detectagraph $15 This detecting instrument of marvelous sensitivity can be used for detecting secret conversations. Outfit consists of Sensitive Transmitter, 25-ft. Black Cord, Receiver, Headband, Case and Battery.

J. F. ARNOLD 2082 Lexington Av. N.Y. Established 1910

and snow. In running the ground wire down the side of a building, it need not be insulated and bare copper wire is generally employed. Fig. 4 shows one form of efficient ground for lightning protection or for the regular station grounding purposes. This ground is composed of a piece of galvanized chicken wire buried from three to five feet in the earth between two layers of charcoal. The depth to which the ground plate is buried will depend upon how dry the top soil is. *The ground plate must be placed in wet earth*, no matter if it has to be buried twenty feet deep, unless some provision is made to keep the earth in this vicinity moist, such as by daily watering, or else by allowing a waste pipe from some water system to empty over the spot.

Types of Masts.

When it comes to masts or towers for supporting the elevated type of antenna, there are many different styles. One of the latest events in radio is the "Tree Aërial," as devised by Maj.-Gen. George O. Squier, which was described in detail, with special drawings, in the July, 1919, issue of the ELECTRICAL EXPERIMENTER.

This represents one form of natural elevation for supporting aërials or aërial conductors at a considerable altitude, and another one is the balloon or box kite. The average Radio Amateur does not care so much about details on the construction of radio masts, for in practically all cases he will follow his own intuition in making use of whatever material and facilities he may happen to have on hand. For example, some antenna masts used in the past have been of the latticed wood form of construction, while others of the iron pipe type have been erected to considerable heights. We remember one mast of iron pipe construction in the vicinity of New York City which rose to a height of 110 feet. For safety's sake, such a mast should not be constructed with too small a pipe at the base, and for altitudes of 75 to 100 feet, the first and second base sections of the mast should comprise standard heavy wrought iron pipe not less than 3 to 3½ inches in diameter. Needless to say, the iron pipe should be either galvanized or else thoroly painted before erection, and very carefully guyed by stranded steel cables attached ⅓, 2/3 the altitude and at the top. Long guy wires should be split up into sections not exceeding 20 feet, by means of strain insulators.

Aërial Insulators.

Various forms of commercial and home-made aërial insulators are shown in Figs. 7 and 8. Fig. 7 illustrates the commercial, fluted type of molded Electrose insulator, as well as the Electrose ball insulator. Where greater efficiency is desired, several of these insulators are connected in series to give a high resistance. Porcelain cleats are often used in constructing small experimental antennæ, and serve the purpose quite well. Another detail shown in Fig. 7 is an aërial insulator made from a piece of hard rubber, polished or unpolished (Bakelite is best), the two ends of which have threaded screw eyes as indicated. A tin or galvanized iron water shield is made to clamp at one end of this hard rubber insulator in order to ward off rain, and thus keep the insulator in a better working condition during inclement weather. It is absolutely impossible to obtain any long distance results for *transmitting* or *receiving* with rain pouring down on the insulators; for a considerable amount of the energy induced in the aërial conductors will leak to earth thru the water covering the insulators. The commercial radio companies have overcome this difficulty by placing cable shields on the antenna insulators in this fashion in a great many instances, and undoubtedly will use more of them as this fact is better appre-

ciated. Figs. 7 and 8 show novel ideas for constructing antenna insulators from porcelain tubes. Of course, the small tubes are not of much use, generally speaking, but the large size tubes, measuring about 12 inches long by 1½ inches in diameter, are cheaply purchased, and make very good insulators. Of course, the main question here is "How can the screw-eyes be securely anchored?" and several suggestions are given in the drawing herewith. In one case the screw-eyes have their lower ends twisted spirally with the largest diameter at the base, so as to hold firmly in molten sulfur; or the screw-eye may be held by slotted wooden blocks cut so as to expand and wedge against one another inside the tube. Fig. 8 shows a detail drawing for making a pair of brass or iron clamps which will make a very substantial aërial insulator from any stout porcelain tube.

THE HOW AND WHY OF RADIO APPARATUS.

Series to Date.

No. 1. *The Induction Coil, Page* 493, *November,* 1916.

No. 2. *The Transformer, Page* 656, *January,* 1917.

No. 3. *Condensers, Page* 735, *February,* 1917.

No. 4. *Spark Gap, Page* 113, *June,* 1917.

No. 5. *Radio Transmitting Inductances, Page* 537, *December,* 1917.

No. 6. *Radio Receiving Tuners, Page* 685, *February,* 1918.

No. 7. *Radio Receiving Condensers, Page* 766, *March,* 1918.

No. 8. *Detectors, Page* 30, *May,* 1918.

No. 9. *Telephone Receivers, Page* 176, *July,* 1918.

No. 10. *Radio Amplifiers, Page* 472, *November,* 1918.

No. 11. *How to Make and Use a Direct-Reading Wave Meter and Decremeter, Page* 874, *April,* 1919.

Radio men everywhere will undoubtedly like to obtain the complete set of these specially prepared papers on the "How and Why of Radio Apparatus." Also the following three important and timely papers on the "Calculation and Measurement of Inductance," by Mr. Secor and Samuel D. Cohen.

Nos. 1, 2 *and* 3 *"Calculation and Measurement of Inductance," appearing in the March, April and September,* 1917, *issues.*

Those interested in these valuable papers can obtain prices of individual back numbers containing them by writing to the "Circulation Department."

In closing, it may be said that the Amateur Radio man will learn much by close observation and the application of common sense and everyday electrical technique to his antenna structures. Don's use faulty lead-in insulators to bring the aërial current into your radio shack—buy a good one, even tho it costs a few dollars. An excellent one is that made of molded Electrose, with threaded tightening flanges. A hole drilled thru the center of a piece of glass, hard rubber or bakelite sheet, at least one foot square, makes a very excellent lead-in insulator. Don't tie your aërial so tight that in a wind-storm it will break at the first swing; suspend one end by a counterbalance weight, or else by springs, so that the flat-top can expand at least 5 to 10 feet in a 100- to 150-foot span. Watch your aërial's behavior in your first wind-storm and you will learn more than by reading several books on the subjects.

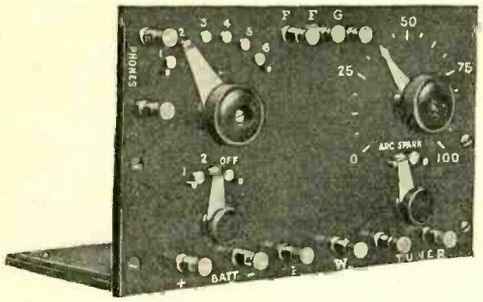
Announcing the New Grebe Vacuum Tube Plate Battery

This is the first practical storage battery for supplying the plate current for vacuum tubes and is so far in advance of all other types that it is destined to maintain the leadership.



The numerous advantages of the lead cell are fully characterized in this battery. The construction is rugged; the plates are of the best design and workmanship; the individual cell-casings are made of transparent Pyralin and welded together to form a solid unit. Its capacity of 3 ampere hours is sufficient for supplying current to a number of tubes simultaneously while assuring peak voltage operation for long periods of discharge. With this battery, charging from A.C. sources is easily accomplished with any type of "Tungar" rectifier without changing any of the windings.

TYPE ROAA—with liquid electrolyte $17.50
TYPE ROAB—with non-spillable electrolyte 19.50

Send for literature on this and other new Grebe developments.

A. H. GREBE & CO. Richmond Hill, N. Y.

AUDIOTRON
VACUUM TUBE PANELS
PARTS AND ACCESSORIES

Panel full XX Grade Continental Bakelite Dielecto Steel cut and whitened engraving. All metal parts heavily nickeled. Switches for double filament tubes and arc or spark reception. New type Back mounted smooth running rheostat. Panel also furnished in maple with imitation black bakelite finish.

No. 8B.	Full Bakelite panel assembled.....	$15.00
No. 8BP.	Complete set of parts.....	12.00
No. 8W.	Wood panel complete	12.50
No. 8WP.	Complete set of parts.....	10.00

Send for free bulletins on panels, couplers, detectors, parts, etc.

Send cash with order and save all delivery charges. Dealers: write for proposition.

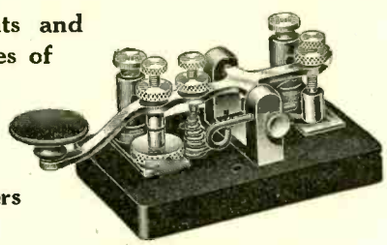
DUCK'S BIG 300 PP. Wireless & Electrical

Catalog is now as it always has been, the largest and most complete and dependable Wireless Catalog published. Mailed for 12c in stamps or coin which may be deducted on first order of one dollar. Catalog not sent otherwise. This catalog costs us twice the price of other catalogs.

Everything in wireless *worth while* is listed in this catalog. The experienced amateur will tell you to see our catalog before buying. You are thereby insured against an unwise purchase. It is the *Beacon Light* to guide you right in the selection of your wireless apparatus. No bigger or better values are obtainable elsewhere. Send for revised price list. It is yours for the asking.

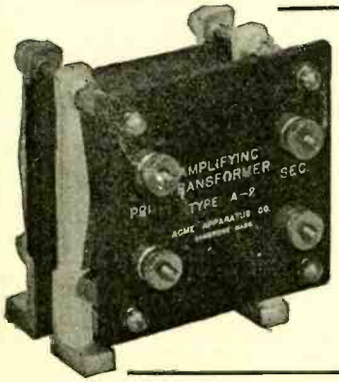
THE WILLIAM B. DUCK CO., 230-232 Superior St., Toledo, Ohio



Manufacturers of Reliable Instruments and Distributors of All Prominent Makes of

RADIO APPARATUS

Everything essential to the successful installation of a radio station.



Bunnell Apparatus is Sold by Dealers Everywhere

Catalog 40-E on Request.

A Special Feature, The Straight Line Radio Key.

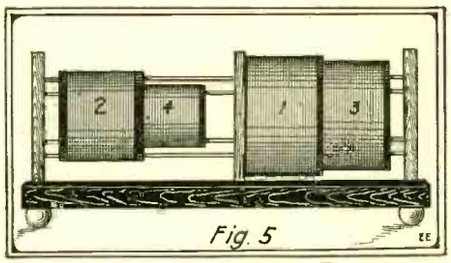
J. H. BUNNEL & CO. 32 Park Place, New York

Acme Apparatus For Results

THE ACME AMPLIFYING TRANSFORMER
Type A-2

A very compact and efficient transformer especially designed for repeating between tubes in Vacuum Tube Amplifier Circuits.
Two-winding, closed magnetic type. Primary and secondary of No. 40 enamelled wire, wound on one leg, with a turns-ratio proved by exhaustive experimentation to be the best. Supported on aluminum castings, with bakelite panel and nickel-plated binding posts. Shipping weight, 2 lbs.

Type A-2 Ampylifying Transformer, $10.00
Same, unmounted 7.50



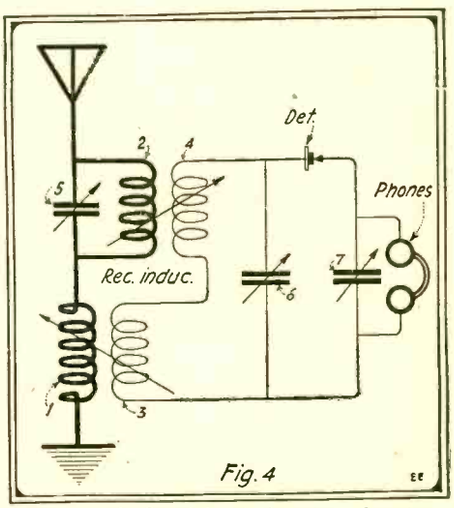
Inquiries solicited from responsible dealers.

ACME APPARATUS COMPANY
23 WINDSOR ST., CAMBRIDGE, MASS.

Eccentric Antennae

(*Continued from page* 432)

the general efficiency of the aërial, but serves to protect it from corrosion. As to the relative merits of the two kinds of wire, there seems to be some doubt. The operaters using each kind declare their own particular kind the best.



Side View of Special Receiving Transformer Having Four Coils. 1 and 2 Are Primaries, While 3 and 4 Represent Secondaries. This Affords Very Fine Tuning.

There has also been some discussion as to the relative merits of the two forms of aërial—i.e., the *flat-top* and *barrel* types. There is no doubt, however, that the barrel type has far more capacity for the same length than the other. But it also, apparently, would help to increase the static in the phones.

The United States Government has evidently found some very excellent advantages in it tho, for it has adopted the barrel type for use on all its battleships, and has practically abandoned the use of the flat-top aërial on them. It was first tried out by our battleships that were working in conjunction with the Allied fleet in the North Sea.

No doubt the up-to-date Amateur will be glad to give these different antennae a try-out.

Hook-up of Special Variometer Coupler, Provided With Four Coils, Two in the Primary and Two in the Secondary.

NEW HONOR FOR SIR OLIVER J. LODGE.

On June 6th at Clarence House, the Duke of Connaught presented to Sir Oliver Lodge the Albert Medal of the Royal Society of Arts, which was awarded to the famous scientist "in recognition of his work as the pioneer of wireless telegraphy."

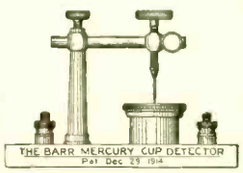
BARGAINS IN RADIO MASTS.

What with the great epidemic of underground antennæ now sweeping Amateur Radiodom, we should shortly see radio masts given away for the asking. What?

COMMERCIAL WIRELESS

Splendid opportunities now in the MERCHANT MARINE for Wireless Operators. Salaries now being paid—Junior Operators, $85 per month; Chief Operators, $110; food and quarters included. Equivalent ashore from $35 to $40 per week. Interesting and fascinating work. Our graduates in all parts of the world as operators, instructors, inspectors, etc., etc. Students from all over the country. If you are interested in Commercial Radio let the EASTERN RADIO INSTITUTE train you. Endorsed by Marconi and Government officials.

SUMMER COURSES. Day or evening start any Monday. Send for prospectus.



EASTERN RADIO INSTITUTE
899B Boylston St. Boston, Mass.

NEW catalog just off the press. Seventy-six pages of new apparatus for the Radio Experimenter. Send 4c for this complete catalog.

Haller, Cunningham Electric Co.,
478 Market Street, San Francisco, Cal.

THE BARR
MERCURY-CUP WIRELESS DETECTOR

The most efficient Detector on the market. Tested by the United States Government and Marconi Wireless Telegraph Co.

Increases the efficiency of every wireless receiving set by making the signals clear, sharp and distinct.
Instantly adjustable at a constant pressure.
For full information and price—write
THE BARR MERCURY-CUP DETECTOR
169 Columbia Heights Brooklyn, N. Y.

TELEGRAPHY

Both wire and wireless, and Station Agency taught thoroughly and quickly, BIG WAGES NOW PAID, some of our recent graduates procuring $138.00 per month to start. Great opportunities for advancement. Our school the oldest and largest—annual enrollment 600 students. Endorsed by railway, telegraph, wireless and government officials. Expenses low—chance to earn part. Catalog free. Write.
DODGE INSTITUTE, 22nd St., Valparaiso, Ind.

New 1 K. W. Quenched Gap Transmitter

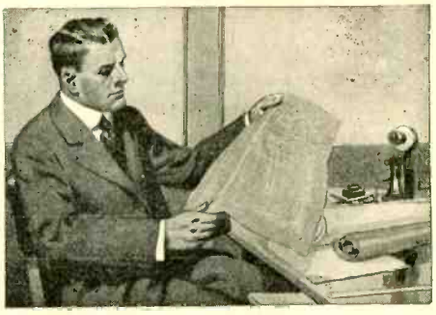
(*Continued from page 427*)

switch has been named a "Tone Clearer" because poorer tone conditions due to changed operation in the gaps may be compensated for by rotating the handle at the left of the holder as shown in Fig. 3. Precaution is urged never to use the power changer or gap changer with the current on, as the shaft and handle are "alive."

Each gap unit consists of two brass discs which are bolted together thru their centers. A silver ring electrode is riveted to one side of each disc. Two fish paper gaskets, one placed underneath the bolt head and the other between the interior face of the discs. Upon close scrutiny these gaskets will be observed in the gap in the photos herewith presented.

Proper cooling of the gap is afforded by the two sheet metal parallel flanges, which are placed integrally with each gap disc. These flanges join each other at two edges only, the other two edges being left open, forming a flue.

The resonance inductance which is furnished with this set is of the iron-clad type. It has two windings, one being for full power operation, the second, which is larger inductance, is for low-power operation. Actual operating tests show that the natural period of the A. C. armature, resonance, inductance and transformer primary is 425 cycles. The operating frequency ranges from 450 to 550 cycles.



One of the most unique parts of this set is the combination flame-proof Morse key and antenna switch. The key is made with larger contacts for carrying audio-frequency currents at low potential. It is encased in a gas-tight housing of black Japanned sheet brass, this housing making the "live" parts of the key free from all electrical contact with the power circuit. The connection between the key and the panel is made by two lengths of flexible cable, each five feet long. By means of the antenna switch, both the generator armature circuit and also the generator field circuit are broken when the switch is in receiving position.

The thermo ammeter is used in connection with the Weston shunt-block, one end being grounded to the panel frame. It reads from 0 to 15 amperes.

The wave changing device that is used in connection with this set, is built for durability as well as the highest efficiency. It consists of a fixt primary coil and movable secondary coil. They are designed to have corresponding turns as tuning points, and make simultaneous contact with two selector arms. At the left of the upper panel will be seen the handle which varies the wave length. At the left of this handle will be seen three openings, the center one being encircled by a white ring. The correct wave-length of the set is read from this point, the other two openings being for various calculations of wave length. The right-hand handle on the panel is used in connection with the loading inductance. Designated wave lengths of this set when operated on a Navy standard are 600, 752, 952 and 1,905 meters. This set under laboratory tests with a dummy antenna, the same as would be used on a ship, has radiated as high as 18 to 19 amperes antenna current. It has a daylight sending range from actual tests of over 1,000 miles.

This set is at the present time being used by the Navy and is installed on a great many of the merchant vessels, and has proven one of the most efficient sets ever designed.—*Photos courtesy, Emil J. Simon.*

Mechanical Engineering

Learn at Home!

Employers everywhere are looking for men with mechanical ability. Splendid salaries and rapid advancement are offered.

There is an easy, delightful way in which you can learn right at home in spare time. For 28 years the International Correspondence Schools have been giving men and women just the training they need for success in mechanical engineering and more than 200 other subjects. Hundreds of thousands have stepped into good positions through I. C. S. help, but never were opportunities so great as now.

Let the I. C. S. help *you*. Choose the work you like best in the coupon below, then mark and mail it today. This doesn't obligate you in the least and it will bring you information that will start you on a successful career. This is your chance. Don't let it slip by. Mark and mail this coupon *now*.

TEAR OUT HERE

INTERNATIONAL CORRESPONDENCE SCHOOLS
BOX 6199, SCRANTON, PA.

Explain, without obligating me, how I can qualify for the position, or in the subject, before which I mark X.

AN EASY WAY TO MAKE MONEY

Don't be content to plod along on a small salary. Be independent. Go in the tire repairing business. One man says "I made $60.00 the first day." Others average $200 to $500 a month. Very little capital needed. Jobs plentiful. Every motorist a possible customer. No experience needed. We teach you.

SHALER Tire Repair Outfit

Improved Wrapped Tread Method Used by Tire Manufacturers

Does as good work as the big high priced vulcanizing outfits. A boy can use it. It's the only vulcanizer that has Automatic Heat Control, and can't undercure or overcure a tire. Requires no watching or regulating.

FREE Book

"How to Open a Tire Repair Shop." It tells how to make big money. Don't delay. Write quick.

C. A. SHALER CO.
2208 Fourth St. Waupun, Wisconsin

BURGESS ENGINEERING COMPANY

Consulting Electrical Engineering

We design and perfect electrical devices and apparatus. Power plants, electric railway maintenance and operation, and railway signals a specialty.

Information supplied on electrical subjects

Write us your needs and permit us to advise you and furnish data. Our service is prompt, reliable and satisfactory, facts which are proven before our bills rendered are payable.

BURGESS BLUE BOOK

Our Mr. Burgess has prepared a pocket-size note book which is especially adapted for use by electrical men and electrical students. It contains over two hundred formulas for calculations and worked out problems, showing how the formulas are used. Also drawings of electrical machinery and devices, particular effort being made in regard to Inside Connections. This book is recommended by electrical men all over the country, is being used in several technical schools, and is being purchased by a number of electrical establishments who furnish them to their employees and customers.

The price of the Burgess Blue Book is $1.00 and we refund the price if the book does not meet with your approval.

BURGESS ENGINEERING CO.

ELECTRICITY

Taught by a practical man.
Put part of your spare time to a good purpose.
A Home Study course for ambitious men.

This is a course of study for the worker, not the idler, and one who wishes to learn the electrical business, or to make quicker and surer progress in this line, I can help. The work as designed, suits both experienced men and beginners as the instruction is actually handled by me with a view of meeting the particular needs of each student. The principal requirement for success in my work is for the student to be willing and anxious to do his part, I do mine and I naturally expect and do insist that the students do theirs.

I Promise Little But Do Much

I only make one promise and that is to satisfy you if you are in earnest and will do your share. I cannot do it all alone for without some effort on your part, my instructions are useless to you. My course of study is not hard and one with an ordinary education can handle it successfully, as I have made every effort to reduce the subject to the simplest possible terms.

RESULTS

Practical men recommend my course to others. Over 65% of my students are engaged in electrical work. Over 11% of my present enrollment was obtained through satisfied students.

FIFTY-FIFTY

All my dealings are on a 50-50 basis. I look at the proposition from your viewpoint as well as mine, and do not expect you to do anything which I would not want to do myself, if I was in your position. While I naturally expect to make money through my efforts, at the same time, MONEY is not my first thought. No student is permitted to pay cash for his course on starting, the payment being made in monthly installments. Also students have the privilege of discontinuing the work if they find it is not just what they wish, and their payments stop at the same time.

Send for my catalogue which tells the whole story regarding the way in which the instruction work is handled, terms and what I have done for others.

Yorke Burgess, Supt.,

BURGESS ELECTRICAL SCHOOL 745 E. 42nd Street, Chicago, Illinois

AMAZING AUDION DETECTOR VALUES-$9.50 $11.75 $18.85 $22.00

Remarkably efficient and handsome audion control panels within the price limit of **EVERY AMATEUR, BUILT AND DESIGNED FOR THE AUDION, AS ONLY THE MAKERS OF THE AUDION CAN BUILD IT.** IN THE PAST, INSTRUMENTS OF THIS CALIBRE HAVE NEVER BEEN OFFERED AT TWICE THESE PRICES.

GENERAL SPECIFICATIONS, ALL MODELS: **Beautifully engraved and grained genuine bakelite panels; 4 prong heavy nickeled tube receptacles; smooth running, positive acting, adjustable rheostats; impregnated efficient mica stopping condensers;** adjustable or fixed grid leaks with polished nickel covers; bakelite covered binding posts with new slotted positive connecting feature; positive segmentally connected nickel plated switches; 40 volt B battery of two 20 volt type units cast en block with operating life of 6 to 12 months—a remarkable advance in B batteries; handsome quartered oak cabinets, round corners, standard de Forest "Early English" finish; perfect workmanship and expensive design throughout.

TYPE P500—$22.00

Type P-400 Audion Panel—Consists of tube receptacle, grid leak and condenser, rheostat and binding post for connection to tuner, A and B batteries on bakelite panel 7½" x 7½" without cabinet and B batteries.....$9.50
Type P-401 Audion Panel—Same as above with cabinet, $11.75
Type P-402 Audion Panel—Larger panel with 40 volt B battery in cabinet.....$18.85
Type P-500 Audion-Ultraudion Panel—Type P-402, Panel with two switches for audion-ultraudion connection and either 20 or 40 volt B battery in cabinet.....$22.00

TYPE P401—$11.75

NOTE: All de Forest audion apparatus is sold without the tubes. Audion detector oscillator or amplifier tubes, $7.00 each additional. Catalog sent on receipt of 10c in stamps to cover postage.

DE FOREST RADIO TEL. & TEL. CO., 1415 Sedgwick Avenue, New York City

Developing An Idea

By Nelson Hall

(*Continued from page* 456)

much, gathers up a large amount of information in his travels which he is ready to impart to any one who will give him an attentive ear. By pulling him to your line you can get what he knows and all he has heard. In time he will make a good advertising medium if he is given "the dope."

Then one can inquire in stores handling such a line for the article. They will show the nearest thing in stock and tell if they have seen anything like it. Also it is good to write to mail order houses, for they are posted on a large variety of manufactured commodities.

Trade journals and magazines have special articles describing new inventions as they come out and later advertise them. One can find these articles by consulting such as *Pool's Index, Reader's Guide to Periodical Literature* and *The Industrial Arts Index,* which can be found in public libraries. Often librarians will look up references and sort out the articles if you will write or telephone your request in time. But usually it is best for one to go over the references himself, for while the articles may not directly pertain to the subject they may suggest something worth while considering. Strange as it may seem, the best part of some papers is in the advertising section. By taking papers going to the class of people interested in your article you can see what is being offered. It is well to look over several different papers, because advertisers do not confine themselves very closely and often try the dailies as well as trade journals. A good paper for general interest is the *Saturday Evening Post;* for office supplies, *System;* for household supplies, *The Ladies Home Companion;* for agricultural implements, *The Farm Journal* or *The Country Gentleman;* for tools, *Machinery;* for marine supplies, *The Marine Engineer;* for power plant equipment, *The Electrical World,* and the ELECTRICAL EXPERIMENTER, for what the electrical experimenter and "bug" will want. Nearly every public library has all of these and many more along the same lines on its files. But if one desires most of them can be obtained from newsstands.

From the advertisers many circulars, catalogs and leaflets can be had for the asking. In some libraries there is a file of trade catalogs in the industrial department that may be profitably consulted.

Sometimes going to all of this trouble will not bring to light the fact that some one has taken out a patent on this very article and has not put it on the market—yet. Hence it behooves one to make a patent search or have one made. Patent attorneys will make the search from a drawing, model, or description if it is clear to them, for a nominal fee. But it is usually more satisfactory for one to make the search himself; then he can see what has been done and the looking about may suggest something new. The *Patent Office Gazette* is on file in public libraries and in offices of many patent attorneys. One can go thru the indexes of these, get the numbers and read the short description given in the Gazette, and if it interests him send for a copy of the original patent. These can be obtained from the Commissioner of Patents, Washington, D. C., for five cents each in coin or money order (no stamps accepted). If one decides to have the search made, be very certain that the attorney has the idea right, understands how it works, and sees the novelty of it. He should be furnished with an assembly drawing, lettered so it can be described, clearly showing how it works, and laying special stress on the novelty. A copy of the one taken to the notary public is all right.

Some may think this is carrying the research too far, but after an inventor has developed an idea or two with much laborious study and a fair amount of money on experimental work he will then realize the importance of looking ahead and finding out what has been done by other inventors *and not do the same thing over.* Looking ahead will save the inventor much annoyance and his company from financial distress. Many Teslas and Edisons are turned into insignificant positions because they blundered in their first attempt and lost heart.

The Mystery of Atmospheric Electricity

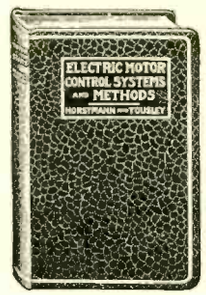
By Rogers D. Rusk, M. A.

(*Continued from page* 416)

particles the water vapor has condensed as a liquid, forming the large ions, while about others it has only condensed as a dense atmosphere, forming the intermediate ions. When the vapor pressure in the air increases, the dense atmosphere on the intermediate ions may change to a liquid, as in Fig. II, and thus the *intermediate* ions become *large* ions in a fraction of time. This theory is not at all conclusive but it fits in with the observed facts better than any other, and is the only one which explains how the intermediate ions may suddenly become larger and more slowly moving. As water vapor only condenses in this peculiar way on rigid surfaces under certain conditions, we must assume that the centers of the intermediate and larger ions are different from the smaller ones usually found in gases and that they contain some small, rigid dust-like particle. This would also explain why they are not found in dust-free gases even tho the small ions are present, and why they are commonly found in the air.

HOW ATMOSPHERIC PARTICLES ARE ELECTRIFIED.

How these particles become *electrified* is another and vital question. There are many possible ways in which the phenomena may be accounted for. The ultra-violet light from the sun is a very powerful ionizing agent, having the power to detach electrons from the molecules of the air, as it passes thru the air. This ultra-violet light is particularly strong in the upper and thinner layers of the atmosphere, and tho the air absorbs a great many of these waves on account of their shortness, still a large number reach the lower levels of the air. Some more visionary theorists claim that ions and electrified particles are actually carried in huge streams from the sun to the earth, and there is some striking evidence that this may be true during periods of the sun's greatest activity. Friction is a great producer of electric charges, as is evidenced by the action of the well known friction *static machine,* and it is highly probable that friction of the air and dust particles in the air may be one of the potent causes of the electrification of the air. Again it may be due in part to radio-active substances in the earth's surface which constantly give off electrified particles into the air.



The mystery of the electricity in the air is a double one and if we could discover just how the ions are produced we could more easily ascertain just what they consist of. When these two questions are solved we may be in a position to harness the "electricity of the air" to our own use.

Fit Yourself for the Big Job

Don't hesitate any longer. There is a greater demand for trained men now than ever before — greater opportunities — bigger pay — more rapid advancement. It's training that counts now—accurate knowledge—a complete grasp of your trade.

Possibilities of High Frequency Currents

(*Continued from page* 410)

could hardly be called power transmission, for only a very small portion of the original energy eventually reaches its destination in any case.

Very few investigators have given any thought to the utilization of these currents, for great power distribution.

Very new and strange phenomena are apparent when these currents are working. For instance, currents can be induced efficiently in circuits *without iron* as a magnetic medicine. Hysteresis losses are practically eliminated. Without iron in a transformer, it would be lighter for a given power than the present 60 cycle ones. It would be more compact, thereby reducing magnetic leakage. There is no saturation point to consider because of an air core. The reactive effect of a few turns of wire

The Special Type of "High Frequency" Induction Furnace Required for Enabling the "Carbon Free" Melts Is Here Illustrated. The Tremendous Concentration of Energy Produced by Inductive Action in a Comparatively Small Volume Makes It Necessary to Maintain the Inductor Coil Cool by Artificial Means. To Accomplish This Cooling in a Simple and Effective Manner, the Material Used for Winding the Inductor Coil Is a Thin Walled Flattened Copper Tubing. It Is Flattened and Wound Edgewise to Obtain the Maximum Possible Number of Turns to the Inch. A Small Flow of Water Thru This Tubular Coil Maintains It Always at the Temperature of the Tap Water Used. The Melt, Which Is Located Within the Inductor Coil and Which May be Only ½ to 1 Inch Less in Diameter than the Inside diameter of the Coil, May be Raised to a Temperature of 2500° or 2800° C., the Coil Remaining Under 20° C.

is very great; but a small condenser will cause resonance. Therefore the power factor can be easily made unity.

Among the few original engineers in this field of high frequency A. C. power transmission is Prof. Dr. E. F. Northrup, who was assisted by the writer at the Palmer Physical Laboratory, Princeton University, in extensive research along these lines. With these currents, it was possible to get results never before obtained by any other investigator.

Advantages of High Frequency Transformers

With an *air core* transformer, having a resistance load, more efficient results were noticed than could be procured with transformers having iron for a core. The losses were mostly due to the resistance of the conductors; but they were very small, as the circuits were of large cross-section. The hysteresis was negligible, due to the absence of iron. Magnetic leakage was reduced to a minimum because the coupling between primary and secondary was close. The capacity was 10 kilowatts, with three turns primary, insulated for 7,200 volts, and one turn secondary, reducing to 2,400 volts. The circuit was *resonant; therefore the power factor was unity*, or numerically 1.

It remained for Prof. E. F. Northrup to critically study these currents at *low voltage*. He found they could be confined in a mass of metal, thereby producing a terrific heat in a very simple and efficient manner.

"The Livest Catalog in America"

Our big, new electrical cyclopedia No. 20 is waiting for you. Positively the most complete Wireless and electrical catalog in print today. 180 Big Pages, 500 illustrations, 300 instruments and apparatus, etc. Big "Treatise on Wireless Telegraphy." 20 FREE coupons for our 160-page FREE Wireless Course in 20 lessons. FREE Cyclopedia No. 20 measures 7x5¼". Weight ½ lb. Beautiful stiff covers.

WIRELESS

Send 6 cents in stamps or coin for which we will send our latest Cyclopedia Catalog No. 20 as described.

All parts for the Amateur to make his own Apparatus.

The present day development in wireless has been to *raise* the voltage and frequency, because under these conditions maximum radiation of energy is brought about.

After several years of careful experimentation, a *high frequency, electric induction furnace* was produced that was applicable for the production of heat in either a *conductor* or *non-conductor*. Its extreme simplicity, owing to the absence of iron and a few turns in the inductor coil, leads one to believe that along these lines lay perfection in electrical mechanics.

At present there is in actual operation under industrial conditions a 20 K.W. furnace of this type. It is used for studying glass at high temperature in *vacuum or under pressure.*

A few years ago applications of this sort were purely imaginary.

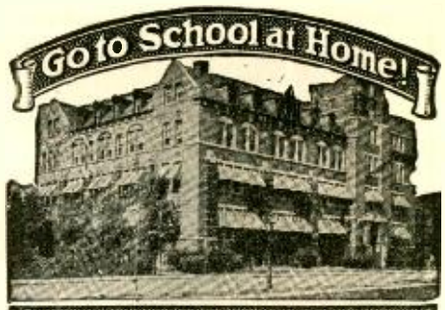
There is now under test a 50 K.W. unit. Most all tests were carried on with the damped oscillations of condenser discharges up to 50 K.W., but the undamped oscillations of the high frequently alternator will be used for greater capacity.

With the spark method for producing these currents, a two phase field was used, no doubt for the first time. Altho nothing other than a half revolution of a circular conductor on an axis in this field was noticed, the writer is firmly convinced that, with proper apparatus and research, an induction motor could be made utilizing these currents. *A motor of this sort would be* WITHOUT IRON as a magnetic medium and therefore extremely light. Proper design would undoubtedly make it efficient.

High frequency lighting has already given promise to be eventually the means whereby the much heralded "cold light" may be produced.

The fundamental principles involved in producing these currents has been firmly establisht in "wireless" and with these methods, slightly changed, it is possible to investigate a brand new field of "endless wonders."

In the last decade there has been marvelous advances in electricity; but these have only paved the way for far greater things.—*Photos courtesy Pyrolectric Instrument Co.*



Practical Chemical Experiments

By Albert W. Wilsdon

(*Continued from page* 418)

soluble glass as it is called. Into most laundry soaps both sodium silicat and sodium carbonat are *crutched,* as a filler to soften hard water and to give additional detergent properties.

Toilet soap is made either by melting raw soap, by perfuming an odorless soap, after cutting in fine shavings and drying, or by making the soap directly by the use of pure materials. In either case the mass is colored by metallic oxids or anilin colors, and is perfumed by the use of essential oils, and is then prest into molds while yet fresh. To make a transparent soap it is necessary to dissolve an ordinary soap in alcohol, allow the insoluble residue to settle out, and distill the alcoholic solution to jelly. This may then be prest into molds and dried. Another method quite frequently utilized is to make a cold process soap, with coloring matter and perfume aded, and then to add to the mass more glycerin, or a strong sugar solution, which renders it still more transparent. Soft soap is made directly by the use of potash lye, or by the use of soda lye and considerable water. The glycerin and the excess of lye, if any, remain in the soft soap. This is used in *fulling* or shrinking cloth and in other manufacturing operations, probably on account of the excess of alkali which it contains. The salt lye which is drawn off

HIGH SCHOOL COURSE IN TWO YEARS

YOU ARE BADLY HANDICAPPED if you lack High School training. You cannot attain business or social prominence. You are barred from a successful business career, from the leading professions, from well-paid civil service jobs, from teaching and college entrance. In fact, employers of practically all worth-while positions demand High School training. You can't hope to succeed in the face of this handicap. But you can remove it. Let the American School help you.

FIT YOURSELF FOR A BIG FUTURE This Course, which has been prepared by some of America's leading professors, will broaden your mind, and make you keen, alert and capable. It is complete, simplified and up-to-date. It covers all subjects given in a resident school and *meets all requirements* of a High School training. From the first lesson to the last you are carefully examined and coached.

USE SPARE TIME ONLY

Most people *idle* away *fifty* hours a week. Probably you do. Use only one-fifth of your wasted hours for study and you can remove your present handicap within *two years.* You will enjoy the lessons and the knowledge you will gain will well repay the time spent in study.

TAKE 10 LESSONS FREE So that you may see for yourself how thorough and complete our training is. We invite you to take *ten lessons* in the High School Course—or any Course of specialized training in the Coupon below—before deciding whether you wish to continue. If you are not then satisfied you are not out one cent. *We absolutely guarantee satisfaction.* On that basis you owe it to yourself to make this test. Check and mail the coupon NOW for full particulars and Free Bulletin.

LEONARD BECK, 102 Meridith Ave., Arverne, N. Y.

from the kettle in which soap is boiled is used for the manufacture of glycerin. In this process the soluble soap and impurities are taken out by chemical treatment, and mineral salts are separated by evaporation and crystallization. The purified crude residue containing about 80 per cent glycerin is distilled with steam under diminished pressure.

It is false economy to use a cheap soap, on account of the excess of alkali which it usually contains, it injures the fabrics washed, by causing the fibers to disintegrate and readily fall apart. There is a great advantage in using a well dried soap, as it does not so readily become soft in the water and therefore does not wash away so quickly. A laundry soap will lose 25 per cent of water if the bars are piled and allowed to remain for some time where they are freely exposed to the air. Chevreul in his researches on soap said that the cleaning action was because the soap was decomposed, when brought into contact with the water, into fatty acid and alkali. The impurities are set free by the alkali and entangled by the fat acid salts, and thus removed with the lather. Thus it will be seen that vigorous rubbing is not necessary to remove the dirt, tho, quite naturally, it aids the process.

Ordinary soaps are readily soluble in water, but if the water is *hard* from the presence of lime or similar mineral substances, the alkali soap is decomposed and an insoluble lime soap is precipitated, thereby forming a disagreeable scum on the water. Not until all this lime is thrown down by the soap will the lather begin to have a detergent action. On account of the necessity for using hard soap in some localities *washing soda* is used to *break* the water; that is to precipitat the lime so that less soap will be required. In order to make a laundry soap fit for hard water, sodium carbonat is added to it in the crutching.

Experiment No. 1. To make a hard soap, dissolve in a medium-sized beaker 15 grams of caustic soda (in stick form) in 120 cc. of water, and pour one-half of this into a porcelain evaporating dish of at least 500 cc. capacity, add 60 cc. of water and 50 grams of tallow. Boil this solution for three-quarters of an hour, carefully replacing, from time to time, the water that has been lost by evaporation; then add the remainder of the solution of caustic soda and boil for at least an hour more. Water should be added as before, but the volume of the liquid may be allowed to decrease about one-third. Add 20 grams of salt, boil for a few minutes, and allow the liquid to cool. The soap will rise to the top, and the glycerin, excess of lye, and salt will remain in solution.

Experiment No. 2. Slightly acidify the water solution separated from the soap in the above experiment with dilute hydrochloric acid. If any fatty acids or impurities separate out, filter. Pour the solution into a porcelain evaporating dish, and evaporate to dryness on a water bath. Dissolve the residue in strong alcohol, filter or decant from the undissolved crystals of salt, and evaporate the alcohol. The slight residue will be sticky, and give the sweet taste of glycerin.

Experiment No. 3. Cut a good quality of soap into shavings and mix with hot water on a water bath, until well dissolved. Add dilute sulfuric acid until the solution is acid. Note that if the soap is *filled,* the sodium carbonat will cause an effervescence on adding acid. Heat on the water bath for some time or boil slowly, and the fatty acid will separate, forming an oily layer on the top. When clear this may be separated from the water by pouring on a wet filter, and the sulfuric acid removed by washing on the filter with hot water.

Washing soda, is often used, not only to soften hard water, but as a stronger

washing agent than soap. This is a much better material than most of the so-called *washing powders* on the market. It should always be dissolved in a bottle or other vessel, and used as a solution in the quantities necessary. An excess disintegrates the fabrics, or *rots* the goods. Sometimes the washing powders or liquids on the market contain in addition to the washing soda, a little soap or ammonium carbonat or a small per cent of borax, but they are much more expensive than the common washing soda, and no more efficient.

Experiment No. 4. To test a washing powder for sodium carbonat, put a little of it in a test tube and add a few drops of hydrochloric acid. If there is a brisk effervescence it will indicate the presence of a carbonat, and if the gas that is given off colors the Bunsen burner flame yellow, it is an indication of the presence of sodium.

Bluing.

Bluing is the process resorted to in the laundry to overcome the slight yellow color of the clothes, and for the same purpose in the bleacheries where new goods are finished. Indigo was one of the substances most commonly used some years ago. It was known to the ancient Egyptians as a dye and to the Romans as a pigment. The method of using it for bluing, as it is insoluble in water, is to tie up a lump in a cloth, and when soaked in water the finely divided precipitat which is in suspension will give a blue color to the water, and to the clothes, which are to be immersed in it.

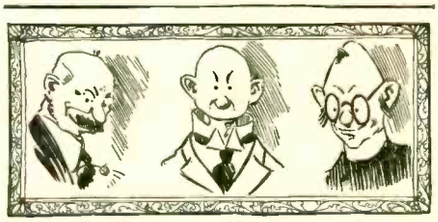
Prussian blue (Ferric Ferrocyanid) is also used for bluing. It is insoluble in water and in mineral acids, but is decomposed by alkalies and dissolved by oxalic acid. It is generally used as a solution or *liquid blue,* but this imparts to the goods a greenish-blue color. On account of the ease with which it is decomposed by the alkalies, there is danger that *iron rust* will be deposited on the goods if this form of blue is used.

Experiment No. 5. Make Prussian blue by the action of Ferric Chlorid upon potassium ferrocyanid in the presence of a few drops of hydrochloric acid. Treat this blue precipitat with an excess of sodium hydroxid, and heat to boiling. Notice the reddish brown precipitat of ferric hydrat.

Experiment No. 6. Make some Prussian blue as in the previous experiment, and add to the precipitat, in the test tube, a few crystals of oxalic acid, and warm the mixture. Notice the intense blue solution obtained (liquid Blue).

Ultramarin is an interesting artificial compound which is put upon the market in the shape of small *bluing balls.* It is similar to the native mineral called *Lapis Lazuli,* and is a double silicat of sodium and aluminum containing sulfur. Like indigo, it is insoluble in water and is simply held in suspension in the liquid. There is a difficulty in preventing the formation of blue spots and streaks with the solid blue. This blue is extensively used for coloring wall paper and for *bluing* white sugar.

Experiment No. 7. To show the presence of sulfur in ultramarin place a part of a bluing ball in water in a test tube, and add to it enough hydrochloric acid to make the solution acid. Notice the odor of escaping gas when the solution is warmed, and test it for hydrogen sulfid by holding above the mouth a piece of paper previously dipt in lead acetat solution. The paper will turn black on account of the formation of lead sulfid.



Anilin colors made from coal tar are the basis of most of the liquid blues upon the market at the present time. The soluble blues from this source are very numerous, and they are probably as satisfactory as anything for this purpose.

VIOLET RAYS

STARTLING NEW ELECTRICAL TREATMENT

FOR HEALTH, ENERGY, BEAUTY

You can now try the wonderful new Violetta—Violet Ray Machine—10 days free in your own home. Give yourself daily treatments—at less than 1 cent per treatment. Rid yourself of headaches, catarrh, constipation, lumbago, insomnia, nervousness. Relieve your pain from neuritis, rheumatism, indigestion, neuralgia. Give yourself beauty treatments—remove eczema, pimples, blackheads, obesity. Make your body a human dynamo of energy and make your skin fine in texture and free from blemishes or sallowness. Double your strength, sharpen your appetite, soothe your nerves, beautify your complexion. Try Violetta 10 days free.

VIOLETTA—NOT A VIBRATOR

The Violetta does not shock or pain. It does not bind the muscles. It is not a vibrator. The Violetta soothes or stimulates, sending the magic healing power of electricity through every cell, tissue, and organ of the body. Electricity in its highest remedial form. Wonderful and painless even to infants. No other form of electricity for home use is so amazing in its results.

10 DAYS' FREE TRIAL IN YOUR OWN HOME

You can try the Violetta in your own home on our 10 days' trial plan. Not one cent do you have to pay if you are not pleased. Why suffer from physical ailments or from the handicap of a sallow, pimply, imperfect skin when you can try this wonderful treatment in your home without risk. The Violetta is used by thousands of physicians and drugless healers as well as by such prominent beauty specialists as E. Burnham, Chicago. Yvette Parlors in eighteen cities, and hundreds of others. Every penny you pay returned instantly if you are not pleased with the Violetta after 10 days' trial. Write for book describing Violetta Outfits and amazing results of Violet Ray treatments.

WRITE FOR BOOK FREE

Just send your name on a post card or use the coupon below for convenience. We want you to know what physicians, drugless healers, sanitariums, beauty specialists and individual owners say about Violet Ray treatments with the Violetta. We want you to know how it removes pain as if by magic—how it clarifies the skin almost over night—why it is painless, harmless, even to infants.

What Physicians and Users Say

Trixie Friganza, well known actress says "Cheerfully will I add my praise for Violetta. It's the best 'pain chaser' and 'soother' I've had the good fortune to find. It's WONDERFUL. It cured my brother of neuritis. As for myself I use it for facial treatments and general massage. I cannot say too much for it."

Dr. Bert H. Rice, of Vinton, Iowa, says: "I have good results with the Violetta High Frequency Instrument in all cases of neuralgia. Almost instant relief in Facial Neuralgia."

K. L. Allen, D.C., 205 Boone National Building, Boone, Iowa, says: "I have had very good results with the application of High Frequency Current in cases of Paralysis, Rheumatism and Neuritis, and think it a great help in drugless healing."

Dr. Daniels, Lisbon, North Dakota, says: "Have used the VIOLETTA in such cases as Goitre, Bronchitis, Pluerisy, Neuritis, Neuralgia and Lumbago, and find it very beneficial. In fact, I would not be without it in my office."

Experiments in Physics

By John J. Furia, A.M.

(*Continued from page* 417)

the card is turning thru 180 degrees the image remains if the speed of the card is sufficiently high. The image of the reverse side strikes the retina while the image of first side is still on it, and hence BOTH objects appear to be in view. This is the fundamental principle of the *motion picture.*

Figure (4) is another example of an illusion due to persistence of vision. A black star is drawn on a blank card. If the card is placed on the forefinger and spun around, the star will disappear and TWO circles will appear as in B, the inner one *black* and the outer one *gray.* As the card is spun around the image of the points of the star and the image of the white card between the points strike the eye in rapid succession, so that due to persistence of vision, both black and white are seen and the result is the gray circle or mixed shade. Since the center of the star is all black, the center circle is black.

Even tho money is not of much use to many of us now, the following interesting device for "Making Money" provides a fitting conclusion to any performance. A small miniature clothes wringer is brought forth. A piece of paper is cut to the size of a dollar bill. The paper is inserted in the wringer, *the handle is turned and a brand new, crisp dollar bill comes out from the other side!* This may be repeated indefinitely (provided the performer is a multi-millionaire). Figure (5) tells the secret. The two rollers are not two distinct rollers, but are made of a continuous piece of goods wound as in B. Beforehand the performer has wound some dollar bills into one of the rollers and then on performing the "stunt" places the paper in the other roller. *As he winds the paper into one roller, the dollar bill is unwound from the other roller.* If the apparatus is well made and carefully put together, a great deal of fun can be gotten from it without the *modus operandi* of the illusion being discovered.

(*To be continued*)

Diploma Awarded to the Electrical Experimenter by the United States Government To Show Its Appreciation of the Patriotic Service Rendered During the War by America's Greatest Electrical Magazine.

"I Can Succeed!"

"What other men have done with the help of the International Correspondence Schools, I can do. If the I. C. S. have raised the salaries of other men, they can raise mine. If they have helped others to advance, they can help me. To me, I. C. S. means 'I CAN SUCCEED.'"

Make up your mind right now that not another day shall pass until you have made *your* start toward success.

For 28 years men in offices, stores, shops, factories, mines, railroads—everywhere—have been winning promotion and increased salaries through the I. C. S. More than 100,000 men and women are getting ready *right now* with I. C. S. help for the bigger jobs ahead.

No matter where you live, the I. C. S. will come to you. No matter what your handicaps, or how small your means, we have a plan to meet your circumstances. No matter what career you may choose, some one of the 280 I. C. S. Courses will surely suit your needs.

When everything has been made easy for you—when one hour a day spent with the I. C. S. in the quiet of your own home will bring you a bigger income, more comforts, more pleasures, all that success means—can you let another single priceless hour of spare time go to waste? Make your start right now! This is all we ask: Without cost, without obligating yourself in any way, put it up to us to prove how we can help you. Just mark and mail this coupon.

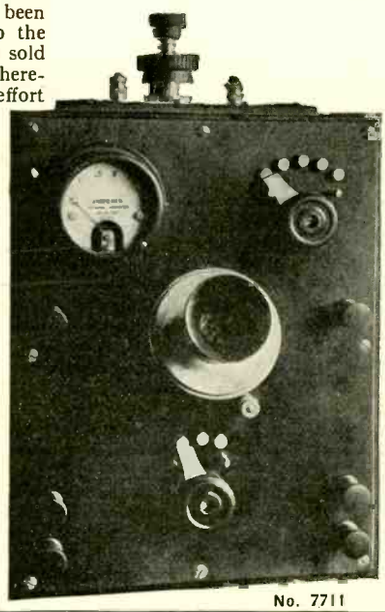
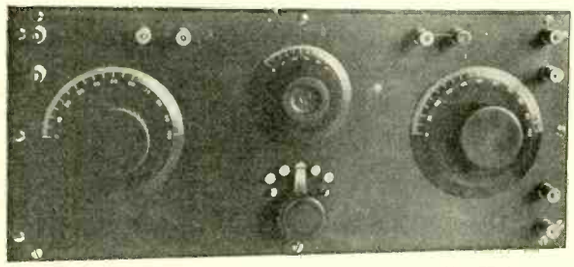
E. I. Co.'s High Grade Radio-Instruments
FOR SCHOOLS AND LABORATORIES AT REASONABLE PRICES

No. 7710



Arc for Generating Undamped Waves for Radio Telephonic & Telegraphic Transmission

These instruments are the acme of perfection in Radio Transmission. The latest and best developments in Radio during the *Great War* are embodied in this apparatus. Educational Institutions and Laboratories can now procure the most modern Radio equipment at a reasonable cost. The undamped *Wave Generator* illustrated is exceptionally well constructed of heavy aluminum. The Arc chamber is flanged in order to offer the greatest cooling surface. The Arc takes place across two solid special Tungsten electrodes which have been found particularly efficient for this work. The electrodes are fully adjustable, permitting very precise adjustment of the emitted oscillatory currents.



No. 7710—½ K.W. Sustained Wave Generator, as illustrated, operates on 110 V D.C. Size 6½ x 6½ x 8½. Shipping weight, 35 lbs.; price.....$50.00

This complete ***Radiophone Transmitter*** is unquestionably one of the finest pieces of Radio apparatus ever placed on the market. A Radiophone might have been sold heretofore; but it was felt that in justice to the purchaser, no instrument of this nature should be sold unless it were possible to obtain efficient results therefrom. This transmitter is the result of great effort expended in the design of a Radiophone set which should meet all requirements as to practicability and compactness combined with highest efficiency. It includes all apparatus necessary for transmission. The Arc is similar to the one illustrated elsewhere on this page.

No. 7711—Complete Sustained Wave Radiophone and Telegraph Transmitter, inclosed in a beautifully finished cabinet; size 14½ x 9 x 12½"; weight 50 pounds; as illustrated; price.....$150.00

No. 7711

No. 7712

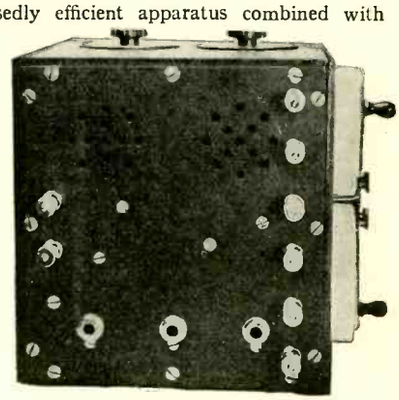
The Short Wave Regenerative receiving cabinet shown is built in accordance with the most modern methods of reception. In work with oscillating audions it is necessary that all losses be diminuated as it was found that tuning should preferably be done with inductance alone, without using variable condensers.

This Receiving set will be found fully up to the mark in comparison with the highest priced set on the market to-day, yet its cost is well within the reach of all.

No. 7712—Regenerative Receiving Cabinet set, as illustrated; size 16¾ x 7⅝ x 8"; weight 25 pounds; price.....$50.00

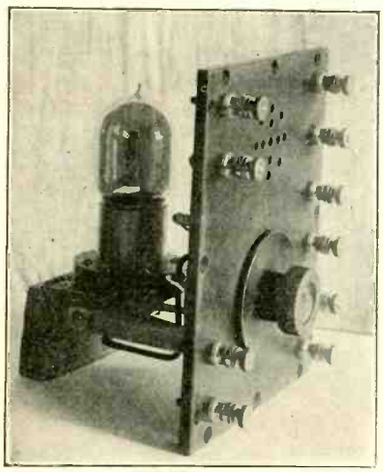
The Vacuum Tube Socket illustrated was designed to be used by those who are desirous of assembling their own vacuum controls and who need a good socket to hold the bulbs. It is well designed, durable and reasonably priced.

No. 7715



No. 7715—Vacuum Tube Socket; 2¼ x 2¼ x 1½"; weight 1 pound; price.....$1.50

This Tube socket is adaptable for both receiving and transmitting tubes.



The Two Step Amplifier illustrated is undoubtedly one of the finest instruments offered to the experimenter. It is an example of unsurpassedly efficient apparatus combined with exceptional mechanical skill in its design and construction. Two Vacuum Tube sockets are mounted within the cabinet which also contains the two amplifying audio-frequency transformers which were especially designed for this instrument. It is of great consistance in amplifying live and radio telephone currents.

The telephones are plugged in any of three jacks mounted on the panel, permitting the use of either one or two steps of the amplifier or simply cutting the amplifier out entirely.

No. 7713—Two Step Amplifier, as illustrated; size 7⅝ x 7¼ x 8"; weight 7 pounds; price.....$55.00

No. 7713

No. 7714

The Vacuum Tube Control Cabinet is one of the essential instruments of the modern radio station. The Vacuum Tube holder, filament, rheostat, grid condenser and grid leak are mounted within the cabinet, the only part on the exterior being the rheostat control knob and dial. The construction throughout is on the same high level of excellence with the other instruments illustrated on this page.

No. 7714—Vacuum Tube Control Cabinet, as illustrated; size 6 x 7⅝ x 6¾; weight 5 pounds; price.....$25.00

P. S. No Tubes furnished by us with these instruments.

Telephone Solves "Lower Berth" Squabble.

(*Continued from page* 408)

The disadvantages of this system of distribution of cards are numerous, the greatest one being that while one agent may entirely fill his cards, another may not, and thus there will be vacancies in spite of a heavy demand at some other window. Added to this there is a good deal of time wasted while the ticket agent is trying to get in touch with some other agent who has a berth open, not to mention your good time and patience wasted while waiting for him to get the desired information.

But this new system which has been installed in the Grand Central Terminal obviates all this. All the time and energy that were formerly wasted are now saved by the creation of one central telephonic distributing system, which has been installed on the second floor of this railroad terminal and known as the *Pullman Distributing Office*. It is kept open all night long, and in it are maintained all the records and diagrams of every parlor and sleeping car operating out of the terminal.

Altogether this office takes care of the seventeen groups of ticket offices spread over New York City, Weehawken, and Yonkers.

This whole system was built especially to order for this railroad company, the idea being the outcome of a long and exhaustive study of the problem by Mr. Neil Mooney and Mr. Devlin, of New York City.

The equipment proper consists of a distributing board 18 feet long, 3½ feet wide and 2½ feet high. For its whole length this is surmounted by a rack containing pigeonholes which accommodate 190 sets of diagrams. This distributing board is built in three sections, with four operators to a section, each operator being assigned a certain set of trains. On the table in front of her is a set of signal lights, and she is equipt with head 'phones and a mouthpiece as shown in the illustration.

In all of the seventeen groups of ticket offices taken care of a duplicate set of buttons is given to each ticket agent. (See illustration.) He is also furnished with a key showing which operators are taking care of certain trains. By this method the agent in Yonkers or at any of the other stations presses a button, and instantly a light flashes before an operator in the distributing room, who answers "All right", —then the conversation runs like this:

TICKET SELLER:
"25.
"Chicago.
"Thursday, April 10th.
"Lower."
PULLMAN CLERK, at Distributing Board:
"All right."
TICKET SELLER:
"1776" (meaning railroad ticket number).
PULLMAN CLERK:
"Lower 12.
"Car 42.
"25.
"Chicago.
"Thursday, April 10th.
"1776."
TICKET SELLER (repeats):
"Lower 12.
"Car 42.
"25.
"Chicago.
"Thursday, April 10th.
"1776."

Translated into good English language this means that a lower berth is desired on train No. 25, the 20th Century Limited, on Thursday, April 10th, New York to Chicago. This formula reduces conversation to a minimum, and is very strictly adhered to. No girl is given "another chance".

At one side of the room are several desks which take care of nothing but telegraphic requests for reservations. Nearly a thousand requests per day are received, and it is easily seen that this forms no small part of the day's work.

Because of this concentration of distribution space may be sold until two minutes before the train leaves, when the diagrams are sent by special messenger from the distribution office to the conductor of the train.

There is one more feature that deserves mention, and that is the entire absence of all bells. All the signals and calls are made by different colored lights. The only time a bell rings is when one of the different circuits opens, or a fuse blows, in which case an expert electrician is immediately set on the job, and the trouble is fixed up very quickly.

Possibly a word as to the operators themselves would not be amiss. They are all well educated girls, some of them from college, a number of them having husbands in the American Expeditionary Force. The majority of them have been chief operators at some other exchange, and all of them have exceptional "speaking voices." The head of that department, Mr. Devlin, was very careful to make clear the difference between the "speaking" and the "talking" or "telephone" voice. A beginner there is paid $87.50 per month, and the more experienced operators get $125. In return the company demands a most rigid discipline while on duty, but at the same time everything is made as pleasant as possible for the girls. On the floor above is a big rest room fitted up with easy chairs and sofas, where the girls may go whenever they feel sick or faint.

Taken all together, the New York Central Railroad is doing its best to present to the long suffering public a good and efficient method of coping with the Pullman proposition, and they feel that their present method is nearly 100 per cent efficient.—*Photos courtesy New York Central Lines.*

Twin Cell Design of Dry Battery

(*Continued on page* 413)

each consisting of flat zinc strips 15/16 in. wide by 24 in. long, bent in the form of a letter "M." The maker points out that these zinc anodes present to the material contained in the cell a surface of around 90 sq. in., as against 42 sq. in. in a round design. It is therefore claimed that the density of current per square inch is greatly reduced with an increase of life of the cell that is of great practical importance.

The common positive electrode can be used with either negative electrode separately or together by joining the two negative electrodes by a connection. This is the way the battery is furnished. Either half of the battery will give 1½ volts, so that when only one-half the cell is used, the remaining half is kept fresh. The battery measures 1⅛ in. by 3 in. by 6 in., and weighs 2 lbs. 2 oz. The outside case is waterproof and non-conducting. On test it is claimed the battery has shown a voltage of 1.5 to 1.55 and on short circuit a current of 35 amperes.

Sent up by Italian scientists, a balloon carrying recording instruments reached an altitude of 23 miles and found the lowest temperature, 70 below zero, 12 miles from the earth's surface.

Become a Doctor of Chiropractic
Advanced Science of Spinal Adjustment

This is the day of drugless healing! In Chiropractic—treatment of disease by spinal adjustment—Science has made a forward step. Look at the newspapers and magazines—note the trend toward the principles of drugless healing, especially Chiropractic.

You can now become a Doctor of Chiropractic **through home study during spare time!** We teach you thoroughly either by mail or in class. You can know **independence and position!** Makes no difference where you live or what you do—you should be able to qualify for this great profession. Some of our graduates report that they

Earn $3,000 or More a Year

Dr. M. D. Moore, Ky., writes of having 17 patients in one day at $2 each. Dr. L. H. Roche, New Jersey, $5,550 a year. Dr. A. H. Morrow, of Illinois, reports earning $22 a day. We could name many other Chiropractors who are making good incomes. See the facts in our Free Book. It's only a question of preparation on your part, to enter a profession that is paying others $3,000 to $5,000 or more a year. Think what it would mean to you to earn such an income and to be your own boss with your own hours. Isn't this the kind of life you are desirous of leading? Well, it is now within your reach. Truly this is a chance for you!

22 CHARTS FREE

$15 Set of 8 Anatomical Charts and $16.50 Set of Nerve and Pain Area Charts

Yes, free to you without a cent, now or later. As an inducement to secure quick action, we will give absolutely free, our big, 72-page book; a $15 set of eight Anatomical Charts, beautifully lithographed in lifelike colors, and also a complete set of colored Nerve and Pain Area and Concussion Charts, regular value, $16.50.

Our Lessons Teach You How to Make Spinal Adjustments for the Speedy Relief of

Headache, Indigestion, Lumbago, Epilepsy, Pleurisy, Constipation, Rheumatism, Neuralgia, Neuritis, Catarrh, Fevers, Jaundice, Dyspepsia, Paralysis, Asthma, etc.

Learn At Home In Spare Time

We train you by mail. You can learn at home in your spare time. You receive the personal instruction of men who are prominent in this great profession. Give us a portion of your spare time, and we will quickly train you to become a Doctor of Chiropractic, ready to step out and take your position of prestige in the world.

Mail Coupon NOW! Why slave your life away in work that you don't like—work that doesn't fit with your ambition? Here's the chance you've been looking for—the opportunity your ambition has sought! Mail coupon today and see the success that may be yours as a Doctor of Chiropractic. Don't delay.

Make Your Stove A Gas Stove

You can be quickly cured, if you
STAMMER
Send 10 cents coin or stamps for 70-page book on Stammering and Stuttering, "Its Cause and Cure." It tells how I cured myself after stammering for 20 years.
Benjamin N. Bogue, 758 Bogue Building, Indianapolis

FREE TO YOU!

Read this Remarkable Offer!

OFFER No. 1

Wireless Course

The most comprehensive Wireless Course ever printed. Contains 160 pages, 350 illustrations. Size of book 6¾"x10". Very fine flexible cloth cover.

FREE with a year's subscription.
Add 5c for postage

OFFER No. 2

Experimental Electricity Course

This masterpiece contains 160 pages, 400 illustrations. Size of book 5"x9". Printed on extra thin paper, so book can be slipped into pocket. Handsome flexible cloth cover.

FREE with a year's subscription. Add 5c postage

OFFER No. 3

How to Make Wireless Sending Apparatus
By 20 Radio Experts

How to Make Wireless Receiving Apparatus
By 20 Radio Constructors

These books are by far the most successful wireless books on the market. Size of each book 5"x7", well bound on good book paper. Covers in two colors. We really cannot praise these books too highly. Each book contains 100 pages and from 88 to 90 illustrations. **BOTH** books **FREE** with a year's subscription. Add 5c for postage

This is a very limited offer. It may be withdrawn at any time, due to the tremendous cost of paper, which IS JUST DOUBLE WHAT IT WAS ONE YEAR AGO. We have only a limited supply of these fine books on hand; after they are gone we cannot reprint the books until conditions become normal again. **Now is your chance.**

The publishers of this journal have earned an enviable reputation of giving more than 100 cents' worth for each dollar spent with them. Profit by this liberal opportunity NOW; it may never be made again.

HERE'S THE OFFER

Subscribe to the ELECTRICAL EXPERIMENTER for one year, at the regular subscription price of $2.00 per year (Canada, foreign and N. Y. C. $2.50) and we will send you either books shown in one of the above offers. If you subscribe for two years, two offers will be given, etc.

If you are a subscriber at present take advantage of this wonderful opportunity anyway. If you do, we will extend your present subscription.

This Offer Limited. *Act Now.*

A Tell-tale Submarine Net

(*Continued from page* 406)

holding the net sets in motion the signaling alarm devices provided by the inventor.

The anchoring devices at each end of the net each comprise a buoy in the form of a cylindrical body or tube containing an air chamber and ballast at the lower end. The lower end of the buoy is connected with a number of chains having weights or anchors at their lower extremities, and all of which may be adjusted and set to maintain the net or nets at the usual depths traveled by submarines. A series of nets can be arranged at various levels so as to form an effective barrier wherever required. The buoys remain in their original position, even if the net is detached by the submarine, and can be used for replacing another net.

Each buoy carries a float chamber having a dependent stem extending into a chamber at the upper end of the main buoy and on this stem is placed a spool carrying a cable. When the net is pulled away from the anchoring devices, a set of catches disengage the spools so that the floats rise to the surface of the water and are carried along by the net. The float will thus serve to indicate that the net has been torn away from its anchorage by a submarine enmeshed therein, and moreover indicate the position of the sub-sea raider. At the same time a set of *marker floats* rise from the buoys to indicate their position.
